—Based upon the *Normaletat* of Prussia of 1892, a revised decree governing the salaries of the teachers in the secondary schools of that kingdom has just been published by the Government. According to this schedule, the salary of the Rector of a full nine-years institution in all the grades, Gymnasium, Realgymnasium, and Oberrealschule, in Berlin, ranges from 6,000 to 7,200 marks; in cities of the first class, in those of more than 50 000 non-military inhabitants, their salaries are 5,100 to 7,200; in all other places, 4,800 to 6,900. The head teachers in the next lower grades of secondary schools, *i. e.*, Progymnasium, Realprogymnasium, and Realschule, in Berlin and cities of the first class, receive from 4,800 to 6,300 marks. The salaries of the permanently appointed teachers below the rank of rector range from 2,700 to 5,100 marks. In addition, after a certain number of years of service, the teachers are credited with a pension claim of from 300 to 900 marks annually. Assistant teachers are paid from 1,-800 to 2,400 marks. Increase of salaries is based on years of service alone. In Berlin, in the regular nine-years institutions, the increase is 400 marks every third year for the rectors, and 300 in the case of the other schools until the maximum salary is reached, and for other teachers the increase is in similar proportion. In addition, these instructors have other claims, such as free tuition for their sons, and in many cases free rent or its equivalent The salaries of university men are only slightly in advance of those given to teachers in the secondary schools. The Prussian Government has just decided to add eighteen men to its university teaching corps next semester. In Koenigsberg, a new full professorship in the philosophical faculty will be worth 6,160 marks, an assistant professorship in theology in Berlin 4,150; two assistant medical chairs will bring their incumbents the same sum; a full professor in the philosophical faculty gets 9,300, while the new assistant professor of Chinese gets only 4,150, but the new full professor in the practical Oriental Seminary receives 8,100 marks. In Halle a new full theological professor gets 4,260, but in the philosophical faculty 6,660. In Goettingen a new philosophical chair brings it incumbent 6,540, but the associate in Egyptology receives only 3,290. The highest salary for the new men is a Catholic theological professorship in Bonn with an income of 10,-260 marks. Of course, these professors receive in addition their lecture fees.

ROGERS'S HISTORY OF AGRICULTURE.

A History of Agriculture and Prices in England, from the year after the Oxford Parliament (1259) to the commencement of the Continental War (1793). Compiled entirely from original and contemporaneous records. By James E. Thorold Rogers. Edited with sundry additions by one of his sons. Vol. VII., 1703-1793. Parts I., II. Pp. xv., xv, 962. Oxford: Clarendon Press; New York: Henry Frowde. 1902.

Economic literature presents no example of a work so long in the making as this 'History of Agriculture and Prices in England.' Projected in 1860, the first two volumes appeared six years later, the third and fourth in 1882, the fifth and sixth in 1887, the seventh in two parts, posthumously, in 1902. Covering a span of forty-two years, the work has thus "worn out one life and has claimed several years of another." As compared with this, the 'Wealth of Nations' took but twelve years to write, although, as Mr. Rae tells us, it was probably in contemplation for twelve years before that. Eden completed his 'State of the Poor' in the thirty-second year of his age; Madox wrote his monumental work before he was forty-five; Macpherson's 'Annals' took at most fifteen years of activity. An interval of less than a score of years separated the publication of the first from the appearance of the sixth volume of Tooke and Newmarch's 'History of Prices.'

The circumstances under which the 'History' was planned are described by Professor Rogers in the preface to the second volume. At the meeting of the International Statistical Congress in 1860, attention was called to the importance of researches into ancient values and the determination of past relations between the prices of labor and food. Being obliged to spend the following long vacation in Oxford, Professor Rogers searched in the Bodleian, and found "a little evidence for the fourteenth century, and much for the sixteenth." In the hope of obtaining further information as to the change of values in the sixteenth century—to which he proposed to confine his researches—he obtained permission to examine the account books and muniment rooms of the older colleges. Here he found, in his own phrase, "a vast store of the most valuable documents," and at once carried the range of his inquiry back to the much earlier period from which the 'History' starts. It was thus chance, as Professor Ashley has said, and not any theory as to the proper method of economic inquiry, which first turned Mr. Rogers's attention in this direction. Nothing could be more explicit than his own statement: "I have thus become an antiquary by accident."

Not only did the impulse of the historian, rather than of the political economist, bring Professor Rogers to the field of his investigation, but it was distinctly as an historian that his work was originally conducted and the early results were presented. He himself described his subject as a "branch of history," revealing "the bygone life of the English people," and, perhaps, aiding "in constructing a philosophy of history by giving depth and solidity to the political events which have been narrated by our annalists." The introductory chapter of the first volume declared: "It is my purpose, in the work before me, to attempt a history of agriculture in England, and to supply a record of prices, especially of corn and labor, from the time at which the earliest consecutive annals begin, down to the close of the eighteenth century." But, however removed from original purpose may have been the intention of using with any directness the results of the projected historical investigation as the data for economic generalizations, it was not long before such a disposition manifested itself. In 1866, at the conclusion of six years' laborious research, the array of facts recorded in the first two volumes had become not only "illustration" to the "maxims of political economy," and "the bases for economical inductions," but even more than this:

"Some of the problems of political economy, therefore, I venture on stating, can

be discerned and determined with greater ease from the facts which I am able to bring before my readers, fragmentary as they sometimes are, than they could be out of the wider information of our own time. Thus, for instance, the laws which govern prices will, I think, be seen more clearly in these mediæval records than they could be in a modern Price Current."

Thenceforth, to the end of his days, Professor Rogers asserted with increasing vehemence his peculiar fitness, by virtue of equipment and method, for the interpretation of economic phenomena. More and more his services as an historian, even as a social or economic historian, were eclipsed, in his own judgment, by his preëminent capacity for the formulation of economic uniformities. He was accustomed to describe the "haughty loftiness" with which many economists discussed economic questions as "very irritating." But surely no other modern political economist, unless perhaps the late Henry Dunning Macleod, entertained a higher opinion of his own contributions to the science, actual and potential, or expressed lower estimates of the endeavors of those who were toiling by different methods in the same fields. In 1888, two years before his death, he wrote:

"It must, I think, be admitted that political economy is in a bad way: its authority is repudiated, its conclusions are assailed, its arguments are compared to the dissertations held in Milton's Limbo, its practical suggestions are conceived to be not much better than those of the philosophers in Laputa. . . . Now all this is very sad. The books which seemed to be wise are often compared to those curious volumes of which the converts at Ephesus made a holocaust. And the criticism is just."

And yet, estimated alone by positive contribution to the body of economic theory, the service of Professor Rogers would be neither great nor enduring. He wrote enveloped in majestic nimbus, ignorant of much and neglectful of more that constitutes the history of economic thought. His arguments were often epithets, and his objects of attack not infrequently figures of straw. Thus, in 1888, the wage-fund theory was held up as a newly discovered phantasm and logomachy—in the United States still worse; in utter neglect of the refutation of Longe, the indictments of Thornton and Cliffe-Leslie, the ponderous recantation of Mill, and the definitive assault of Walker.

A more important service of Professor Rogers to economic science was in aiding and strengthening the reaction in economic methodology from the *à priori* absolutism of the classical economists to the historical-comparative spirit of the modern day. His fairest and most intelligent critic, Professor Ashley, has told how his name was a tower of strength to those rebellious economists in England who, during the decade 1870-1880, began to criticise accepted doctrines, and how they sheltered themselves behind his reputation for heterodoxy and learning, without very carefully examining wherein Mr. Rogers really was heterodox. It is perhaps not too much to say that Thorold Rogers occupied, although far less consciously, the same relation to the economic reaction in England that Wilhelm Roscher did to the related movement in Germany and to its powerful reflection in the United States.

But it is, after all, upon his work as an historian and as an economic interpreter of history that the lasting fame of Thorold Rogers will rest. Many years will pass before his authority on mediæval prices will cease to be the highest. And even thereafter, when successful criticism of specific, sometimes cherished, conclusions shall have broadened into a more vital assault upon plan and method, only the captious and unsympathetic student will fail to accord full meed of praise to the devoted scholarship and unremitting enthusiasm of this sturdy pioneer.

It is in a spirit something akin to this that the two volumes before us will be judged. Filial piety has endeavored to accomplish that which only antiquarian zeal could hope to attain. We are told that, during the last three years of his life, Professor Rogers was busily engaged in collecting material for the concluding part of his book. But the end came before the prices had been collected for single articles for every year in the period marked out, and many subjects were inadequately represented. More unfortunate still, among the papers that were left, no clue was found to the existence of any other figures or to the source from which the historian had proposed to draw further information. Of the two courses available in preparing the manuscript for publication, namely, to print the tabulations precisely as they stood, or to supplement them as far as possible by further research, the latter course was taken by Mr. Arthur G. L. Rogers, a son of the lamented historian, who was chosen by the delegates of the Clarendon Press to complete the work.

Mr. Rogers has attempted to continue, in something of the same spirit that inspired his father's researches, the history of prices for the 90 years from 1703 to 1793. Unhappily, for this later period the sources of information upon which the earlier volumes were based—namely, the domestic accounts of the older Oxford colleges—are no longer available. Accordingly, the editor has had recourse to various other sources, the most important being the domestic accounts of the Cholmeley family at Brandsby Hall in Yorkshire. Here have been found, in addition to many other documents of great interest, "an almost complete collection of receipted bills from about the year 1740, when the real founder of the family, Francis Cholmeley, began to build the manor house and started an enterprising career of agricultural improvements." The family appear to have led the quiet regular life of English country gentlefolk of the eighteenth century, engaging in public affairs to a limited extent, but in the main living, marrying, and dying in normal, uneventful succession. The financial records of this little domestic economy, the range of which is from the purchase of nutmegs to "allopeen for lining skirts," may perhaps be regarded as detail typical of the time and place from which gleaned. Yet a cautious student will be very slow in encouraging any generalization as to social or economic conditions in the eighteenth century upon the microscopic minutiæ here revealed. Illustration rather than induction is the service which limited data of this kind can render, either to the historian or to the economist.

The prices contained in the second part of the volume are of a more miscellaneous character, and have been derived from various sources. A series of notes from the Cholmeley and Howard papers, various tables of gifts, incomes and estimates from the records of All Souls' and from the newspapers in the Burney Collection, a curious account, found in an old pocket-book at Brandsby Hall, of the investments and losses of an unfortunate speculator in the "bubbles" of the early eighteenth century, lists of prices from Mortimer, Lawrence, and Arthur Young, take up a hundred pages, leaving some two hundred more to minute quotations of the prices of stock of the South Sea Company, the Bank of England, the East India Company, and the Consolidated Three Per Cents. There is no reason to believe that the excerpts and the tabulations have been made with other than care and fidelity; but surely not even the most enthusiastic believer in the value of price tabulations will assert that the same ends which warranted Professor Rogers in collecting and printing voluminous details from fifteenth and sixteenth-century rent-rolls have justified his son in reproducing from eighteenth-century newspapers the almost daily quotations of historic corporate securities and public funds.

The most serious deficiency in the volumes before us is the complete absence of anything like the commentary that interpreted, even if it did not lighten, the details of the earlier volumes. Here we may well understand that the heart of the editor failed him. But, in undertaking to complete rather than to publish the fragments left by his father, this full responsibility of an author-editor may reasonably be said to have been assumed, and the deficiency cannot but fail to detract from what at best must have been an arduous and thankless service.

NAPLES IN 1799.

Naples in 1799: An Account of the Revolution of 1799 and of the Rise and Fall of the Parthenopean Republic. By Constance H. D. Giglioli (*née* Stocker). London: John Murray; New York: E. P. Dutton & Co.

If Lord Nelson had not been by what seems a mere accident tragically involved in the affairs of Naples in 1798-9, it is doubtful whether the English-speaking world would have known much about them. After annihilating the French fleet in the battle of the Nile, on August 1, 1798, he sailed westward and put into Naples at the end of September for a short rest. Unfortunately, there he met Lady Hamilton, with whom he became infatuated. She, the tool of the Neapolitan Queen, Maria Carolina, made Nelson her own tool. He dallied at Naples until December, when he took the fugitive royal family on his flagship to Palermo, and there he lingered, bound by a guilty amour, till the following June. Then he went back to Naples, and, in behalf of the royal coward, who stayed behind at Palermo, he devoted his energies to persecuting and hanging the patriots who had capitulated only through treachery, which he approved, if indeed he did not originate it. Had Nelson in September, 1798, stayed at Malta or Syracuse, as he might well have done, and so escaped the baleful seduction of Lady Hamilton, Eng-

land would have been saved one of the most shameful blots in her history.

The outlines of these events have been commonly known for a century, and partisans have written bitterly on one side or the other. It speaks well for human nature that so many persons who accepted Nelson as a hero—and of course as a winner of naval battles he was a hero—refused to believe that he could be entangled in so base an enterprise. They condoned his profligacy, but the thought that an English admiral could for a year make himself the agent of the most despicable lot of cowards that even the Bourbons have mustered, that he gladly executed their wishes and went beyond them, that he was not only merciless but inhuman, and gloried in it—these were things which, for the honor of human nature, everybody would like to have disproved. But that cannot be.

Capt. Mahan, Nelson's most recent biographer, relying with unwarranted confidence on Commander Miles, R. N., who wrote in 1843, implies that the charges of treachery and of cruelty were unfounded. What are the facts as to the treachery? In June, 1799, Cardinal Ruffo, who by express command of the King had gathered a nondescript army to win back the mainland, and had made his way from Calabria to the walls of Naples, offered the revolutionary garrisons in the city fair terms if they would surrender. They accepted. But at the very moment when the capitulation was about to be carried out, Nelson sailed into the harbor, and refused, in the King's name, to sanction any offer of amnesty to the patriots. Ruffo protested that the terms were already agreed to, and could not honorably be broken. The patriots, believing that they were acting according to the agreement with Ruffo, evacuated Castles Nuovo and dell' Uovo. Many of them embarked on transports which, they supposed, were to take them to exile in France; others returned to their homes. This was on June 27. "Very early in the morning of the 28th the transports were brought under the guns of the castles [now occupied by the English] and of the English ships, and made fast." Their cheated passengers, instead of sailing off to France, were kept prisoners on board, until, singly or in batches, they could be tried and rowed ashore to be executed. All through the summer, this butcher's work, which Nelson superintended, went on. To say that there does not exist in his handwriting the order to deceive the garrisons of the castles into surrendering, is futile; the guilt falls morally on him, as he was the commander-in-chief, and, far from repudiating the treachery, he at once turned it to the profit of the despicable Ferdinand. When a man of honor discovers that in his name one of his subordinates has committed the basest act possible in war, he annuls it, cost what it may. But Nelson was in no sense a man of honor. In this affair, to quote a recent Italian historian, "Nelson acted like a pirate, the Queen like a tiger, the King like a clown."

Next, as to the cruelty. It was by Nelson's order that Prince Caracciolo was brought on board the flagship; Nelson himself appointed the court-martial, putting at its head a man who notoriously hated the prisoner; and when the court declared post-haste that Caracciolo was guilty, Nelson ordered that he be hanged at the yard-arm of the *Minerva*. Caracciolo did not stoop to ask mercy, but he did ask to be shot, as became a soldier and a brave man. Nelson not only refused this, but further ordered that Caracciolo's body, after dangling from the yard-arm till dark, should be cut down so as to drop into the sea, without Christian burial. What this meant to a Catholic need not be rehearsed here; but we may remark that the spirit of cruelty which impelled the English admiral to treat even the corpse of a brave victim with indignity abhorrent to civilized men, was akin to the cruelty of savages who mutilate or eat the bodies of their enemies.

These facts in regard to Caracciolo are indisputable; Nelson himself never denied them; and neither Commander Miles, R. N., nor Capt. Mahan, U. S. N., can so varnish them as to hide their hideousness. Southey, who certainly did not underestimate Nelson, forestalled the verdict of posterity when he said, concerning the treachery: "To palliate it would be in vain; to justify it would be wicked; there is no alternative, for one who will not make himself a participator in guilt, but to record the disgraceful story with sorrow and with shame." And of Nelson's brutality towards Prince Caracciolo, Southey adds that it "stained ineffaceably his public character."

We deal with this topic first, because it naturally claims the first attention of English readers; but the peculiar merit of Countess Giglioli's book is due to the fact that she tells the whole story of the Parthenopean Republic, and makes intelligible, certainly for the first time in English, the aims of the various parties, the kaleidoscopic changes of purpose, and the characters and deeds of the chief actors. As a study in revolutions, that at Naples in 1798-9 deserves to be better known, for it illustrates better than any other how a people utterly sunk in corruption, with only a few inexperienced enthusiasts and neither arms nor money, must behave when it unexpectedly has liberty thrust upon it. Countess Giglioli gives life-like portraits of Ferdinand, of Maria Carolina, of Acton, their vile minister, of the Hamiltons, and of Ruffo. She introduces us to the patriots, who have hitherto been rather shadowy persons—to Pignatelli, Baffi, Cirillo, Mario Pagano, Mauri, Caracciolo, Eleonora Pimentel and many others, who, whatever their shortcomings in statesmanship, were truly patriotic. The mere fact that out of such a society so many high-minded persons could spring, and that, when put to the supreme test of cruelty and death, they did not flinch, should silence pessimists who preach that any community is too far gone in rottenness ever to become regenerate.

Countess Giglioli describes the awful conditions of poverty which prevailed throughout the Kingdom of the Two Sicilies in the last quarter of the eighteenth century, when the lower classes were crushed by the feudal system beyond the worst that Arthur Young records in France. The Neapolitan Crown had begun to curtail feudalism and to restrain the power of the great nobles when the French Revolution broke out. Thenceforth the royal policy resisted every reform, for in any change it dreaded a repetition of the destruction of monarchy which had come so swiftly in France. The Queen, Maria Carolina, was sister of Marie Antoinette, and she, with Acton, practically governed Naples, their sole aim being to prevent the overthrow of the throne. Naples remained neutral down to 1798, and was nominally still a neutral when Nelson came with his fleet to refit. Only in the autumn of that year did Ferdinand declare war against France, and march to Rome to drive out the French. That campaign, a rare specimen of Bourbon braggadocio, resulted in the invasion of Naples by the French, and the flight of the royal family to Palermo.

Their flight left the city and the mainland in a state of anarchy. The great multitude of *lazzaroni*—idlers, criminals, beggars, ruffians—who were the special pets of the King and Queen, proceeded to loot and slay. The minority of reformers, who for ten years past had been hoping for a constitutional government, saw that they must choose between annihilation by the mob and a French occupation. They decided to admit the French, and for a few weeks order was restored. But, late in the winter, the French were recalled; the Parthenopean republic, without real strength, slowly collapsed, so that by the middle of June it realized that it could not save the capital from Cardinal Ruffo, Ferdinand's lieutenant, who had marched up from the south with an army of brigands. But the garrisons could have done much damage, both to Ruffo and the English ships in the harbor, if they had not been tricked into accepting the treacherous terms of capitulation.

The rest of the story is taken up with horrors. The incredible atrocities practised on thousands of prisoners, the inhumanity of the executions, the systematic robbery which had the royal sanction, the habitual perfidy, have certainly never been surpassed, and, happily, seldom equalled, in lands inhabited by white men. And all the time the coward monarchs cringed beyond danger at Palermo, sending daily their stereotyped message, "Kill! Kill!" while their minions at Naples carried on the frightful work, secure enough so long as the British men-of-war lay at the Molo to protect them. Well does Countess Giglioli say: "In that blind and stupid ferocity which he exalted into a sense of duty, Nelson helped the Bourbons to their eternal shame, and struck a mortal blow to the dynasty of which he had chosen to be a paladin."

Countess Giglioli, who is an Englishwoman, has done her work well. Although she modestly disclaims originality, she is original in putting into this clear, attractive, and convincing form a memorable but tangled story. She has exhausted all the printed sources, and has had access to many that have never been printed. She has listened to Helfert, the Austrian apologist of Maria Carolina, and to J. C. Jeaffreson, who made a business of whitewashing the disreputable. She writes spiritedly, and, considering the horrors which make up most of her volume, she writes with remarkable restraint. She has told to English readers the tragic fate of many brave but obscure victims of that Reign of Terror; and she has shown the logical sequence of events. Her book is finely illustrated with some forty views and portraits, many of the latter being now printed for the first time.

The Reign of Queen Anne. By Justin McCarthy. 2 vols. Harper & Brothers. New York. 1902.

Mr. McCarthy's style and method of historical composition have already been illustrated by so many well-known works that we shall attempt neither to describe nor criticise them here. It will be enough to state that in sketching the reign of Queen Anne he follows much the same treatment which he observed in sketching the reign of Queen Victoria. The subject, with its due admixture of politics and literature, is congenial to him. Despite certain political proclivities, he writes with candor and breadth of mind. Though diffuse, he is not too diffuse for the taste and comprehension of a general audience. He is never bitter and never dull.

The Queen herself we may at once dismiss, for Mr. McCarthy, like other historians, seems to have found her character quite colorless. When we have said that she possessed the domestic virtues and felt the need of relying on a confidant in times of political crisis, little remains. She gave her name to an era, and at least she was not vicious, but we must excuse her biographers from attempting to supply a subtle analysis of personal traits. We sympathize with her because she was a mother who witnessed an almost unexampled mortality among her children. After this tribute to maternal grief, we may well leave the palace and fix our attention on the reign.

Mr. McCarthy is not inclined to minimize the importance of his subject. "The reign of Queen Anne," he says, "stands out a distinct epoch in the history of the world. It takes rank with the age of Pericles in Greece, with the Augustan era in Rome, with the Elizabethan era in England." Fifty years ago this view was common, but since then it has been less frequently advanced. We are interested to see it reappearing in the pages of Mr. McCarthy. His high opinion of the period, or of its importance, is traceable, we imagine, to the parliamentary instincts which he shares with other old members of the House of Commons. The strife of political parties prior to the Revolution of 1688 was still accompanied by extreme bitterness. The rancors begotten of civil war were not forgotten, and a religious antagonism which often bore fruit in persecution had not yet disappeared. With the reign of William and Mary, English public life enters upon a milder period, and when we reach the reign of Anne the leading political parties have tacitly agreed to play the game of politics according to more enlightened rules. The new régime is unmarked by organic changes of form, but the spirit of Parliamentary debate is altered, and the House of Commons attains an eminence which it has never before reached save in days of revolution.

Mr. McCarthy has heard many a midnight speech beneath the roof of St. Stephen's, and he looks back to the dawn of the eighteenth century for the rise of those modern conditions of debate and influence with which as a politician he is deeply familiar. Hence arises, we may conjecture, his chief interest in this period. "The reign of Anne," he urges, "saw for the first time the recognition of the principle that the sovereign could no longer act without regard for the authority of the representative chamber. The mere fact that such an authority was thus established and recognized, gave to the House of Commons new motives for existence. Parliamentary debate became with Queen Anne's reign one of the great moving forces in the system of constitutional government."

Whether from this fondness for the parliamentary motive or from a wish to accentuate the more picturesque aspects of the time, Mr. McCarthy hardly does justice by the supreme triumph which was won in Anne's name. We refer to the union with Scotland. He refers to it, indeed, "as one of the greatest and most successful events which mark with honor the momentous history of that reign," but such a qualified statement as this amounts to damning with faint praise. While his narrative of circumstances may be termed sufficiently full, his appreciation of results cannot be called adequate.

Among the politicians and generals, Bolingbroke and Marlborough furnish Mr. McCarthy with his most engaging material. The latter he considers to have been badly used by the Government, the faults of his own character notwithstanding. So far as we can see, he would urge on behalf of Marlborough the considerations which might be brought forward on behalf of Bacon and Mirabeau. Bacon took bribes, but delivered judgment with complete impartiality. Mirabeau accepted a pension from Louis XVI., but followed a political course that was dictated by conviction. In defence of Marlborough Mr. McCarthy urges an extenuating circumstance when he recalls how fluid and uncertain were the political principles of that time, and how even the Queen herself was compelled to support systems and opinions for which she had no sympathy. On the main issue of patriotism and perfidy, Mr. McCarthy acquits Marlborough in triumph, and taxes his country with ingratitude. "There is no reason to doubt that while he was engaged in the work for which his genius so splendidly qualified him, he had in his mind and at his heart, above all other objects, the success of the state and of the cause which he represented on the field of battle." With such a verdict as this the great Churchill may be said to get off rather lightly.

Like so many moderns, Mr. McCarthy has yielded to the allurements and cleverness of Bolingbroke. Here we cannot follow him, at least when he gets beyond the pale of a purely intellectual admiration. The idea, for example, that Bolingbroke, with all his ambition and scheming, "was not a man to cherish deep dislikes," is at variance with our whole conception of his career. Stranger still, it seems to us, is the following sentence: "Charles James Fox once said of himself that he could never be much of a hater; and in the better part of Bolingbroke's character, as well as in his parliamentary gifts, there was much which seems to have a certain kinship with the nature and the genius of Fox." Unfortunately "the better part" is less conspicuous with Bolingbroke than with Fox.

The chapters on Swift, Addison, and Pope are all agreeably written, and none of them fails in cordiality of appreciation. Swift has for Mr. McCarthy the special interest which is likely to be awakened in a modern breast by "the prince of journalists." "Swift," he says, "might fairly be called the creator of the modern leading article." Pope's poetry is likened to the Thames rather than to the Rhine, the Mississippi, or the headlong rivers of Italy. "It was like the Thames as it flowed past Pope's home, beautiful, tranquil, musical, not driven by tempest, not calling up images of passion and destruction, but holding always the love of those who from the first are able to appreciate its charm." As for the quarrel between Pope and Addison, Mr. McCarthy agrees that Pope was in the wrong, but cannot bring himself to regret that the "Epistle to Arbuthnot" was written. "Probably English literature hardly contains any rhymed passage of the same length from which so many quotations are so often made."

Mr. McCarthy lays no claim to historical erudition. We look to him more for graphic passages and for judgments on literary or political character. These verdicts, his wide knowledge of men and books, combined with good sense and an unfailing urbanity of temper, enables him to deliver with very considerable force.

The True History of the American Revolution. By Sydney George Fisher. Philadelphia: J. B. Lippincott Co. 1902. Pp. 437.

Without wishing that history should cease to be true, one may be excused for hoping that the "true" history may speedily run its course. Mr. Fisher calls his book the "true" history of the Revolution because it presents the Revolution in what seems to him to be the true light, while previous historians have consciously "decided" to present the Revolution in what they very well knew to be a false light. "The historians" have falsified the history of the Revolution in five respects: (1) They have treated the desire for independence "as a sudden thought, and not a long growth and development"; (2) they have assumed that "every detail of the conduct of the British Government was absurdly stupid, even from its own point of view"; (3) they have considered that the Loyalists were "few in numbers and their arguments not worth considering"; (4) they have thought it necessary to refrain from describing "in their full meaning and force the irregular conduct in the colonies which led England to try and remodel them as soon as the fear of the French in Canada was removed"; (5) more especially, they have thought it "will be better" to suppress the evidence with reference to the motives of Gen. Howe in his conduct of the war. The conduct of Howe, indeed, is the principal point which Mr. Fisher emphasizes. Howe was a Whig, and used his "olive-branch" instructions to crush the Tories in England by aiding the Whigs in America; but "the historians" have suppressed the evidence on this point. It is to change all this that we have the "true history." As might be supposed, proportion and emphasis have been subordinated to the necessity of correcting these conscious suppressions and these mistaken notions. Of the 428 pages of text, 247 are required to bring the story down to Bunker Hill; 121 pages are given to Howe's conduct of the war; 60 more are sufficient for the period from Saratoga to Yorktown.

So far as serious students of history are concerned, Mr. Fisher is demolishing a man

of straw. One gets the impression that he has read nothing that has been published within the last two decades, which have witnessed the appearance of special works on piracy and illegal trade, on the military operations of the war, on the relation of England to the colonies, on the attempt of England to "remodel the colonies" (which, by the way, dates from the seventeenth century rather than from 1763), and on the Loyalists, much fuller and more satisfactory than Mr. Fisher's treatment of these or similar subjects. Doubtless there is no satisfactory single work on the Revolution as a whole, but the work of Fiske, or Trevelyan, or Lecky does not at all answer Mr. Fisher's description of that of "the historians," while, taken together, they furnish a much "truer" account than his own. Twenty years ago, Mr. Fisher's book would have been serviceable as a disturber of prejudices; to-day it can profit only to the general reader who has been reared mainly on a diet of Barnes and Bancroft.

Assuming, however, that there is a large class of such readers, the book is still open to criticism. There is everywhere a forcing of the note, an exaggeration of emphasis, a lack of sane judgment. One gets the impression that the Revolution was an event predetermined by the patriot leaders, but carried to a successful conclusion only by the special dispensation of Howe. The patriot leaders are too merely cunning, the Loyalists are scarcely more than a string of of arguments, Washington has too much the air of hunting for "traps" to get into and out of, Howe has too much ability and too little patriotism, there is too much of the olive branch in the first years of the war and too much of the sword in the last. Finally, in details, the book is not free from errors of fact, questionable dogmatizing, confusion of thought, and irrelevant incidents. It is not true that Boston "demanded" the first Continental Congress (p. 123). It is too strong to say that England never "really established her sovereignty" in the colonies (p. 31). It is mere confusion of thought to assume that because "the historians" think the Declaration of Independence was not long premeditated, they therefore think the desire for independence, much less the Revolution itself, was a "sudden thought" and not a long growth and development (p. 5, chap. ix). The "true" history of Aaron Burr, Jacataqua, their dog, and their child, has no discoverable relation with the "true" history of the expedition to Canada (p. 275).

There is no bibliography, and no adequate index.

Reminiscences of Early Chicago and Vicinity. By Edwin O. Gale. Illustrated by W. E. S. Trowbridge. Fleming H. Revell Co. 1902. Pp. 452.

When Meriwether Lewis, after toiling two years up the Missouri, stood at the fountain-head of that river, he found it small, forming a rivulet he could step across. But, however small to his eye, it was great to his mind; he knew what great things had come from it. In like manner, Mr. Gale, who has walked hand in hand with Chicago's advancement at every step, feels a thrill regarding every feature of the hamlet where his eyes first took conscious notice of anything. His feeling has deepened as the 600 (the maximum estimate of the population he first saw there) have died or scattered beyond knowledge, so that he—perhaps he only—has now escaped to tell us of his own and the city's cradle-years. Not yet threescore and ten, he has seen Chicago exhibit the most marvellous growth of ancient or of modern times. No wonder his heart sometimes overflows in "measured lines which jingle at their ends"; and readers of his pathetic stanzas on Chicago River will hesitate to call him a mean poet.

His diary of current events was early begun. His reminiscences were corrected and completed by research in newspapers often of unique files, by correspondence with his local contemporaries whose race is run, and, above all, through interviews at Old Settlers' annual receptions on his Sabine farm, his father's Galewood. How can 'Early Chicago' fail to become a universal necessity? It answers questions sometimes asked by all dwellers there and by as many outsiders, and to which few of those myriads can find answers from such a first-hand source. Some of these inquiries are when, how, and in what local habitations Chicago's beginnings began, each marking a step forward, if not always upward. Answers, not without many a mnemonic tag, are furnished concerning buildings or establishments like the following—the first brick house, saloon, church (Methodist, half of a log house), school (whether Sunday or secular), tavern (eight among a census of 600), post-office, postrider, stage coach, horse car, steamboat, railroad, bank, gaslight, locofocos (which rendered superfluous the by-law against carrying live coals through the streets in an open vessel), primitive makeshifts at fires, the first steam fire engine, the first piano, milliner, and silversmith (all three more primeval than we think), the first ditching, planking, sidewalking, and draining of streets; canals and waterworks; newspapers from their start, etc. To set before us these origins and others beyond arithmetic, so that we remember much and get an interest in more, no man can be better fitted than is Mr. Gale. Such a herald of the city's dawn we have not seen, nor of a certainty shall we see.

He has witnessed all vicissitudes, and has had more than a finger in not a few. Versatile by nature, he tasted several lines of life before deciding on a druggist's pestle and mortar as his life-work. His Boston birth (1832) was that of Chicago, for Government land there was then first sold. Within three years thereafter, his coming was a swift transit of thirty-two days from New York city, all but nine of them sailing from Buffalo on a brig. Ever since, Chicago has been his home, in the main on the selfsame suburban farm preëmpted by his father very early, and the only one within city limits still held by the family of him who entered it (p. 243). Incidents back of his own memory were so transfused into him by hearsay that he unawares, through a dozen pages, writes of himself while a three-year-old seeing whatever his father saw. His words are, "*We* look about town." "*Our* historic stroll," etc. His phrases and etymologies would sometimes make Quintilian stare if not gasp, and he uses words unknown both to the Century and the Oxford storehouse; yet we can believe that, as he says, he was in boyhood a student of Latin, and that for a year after entering business he daily consumed midnight oil in learning German.

Countless minutiæ, particularly dates and names, which last form a sort of golden book or 'Who's Who' of pioneer worthies, cannot be held in hand by readers. Knowing the inevitable lapses of memory, Mr. Gale has provided an index, here preeminently needful. Thus his volume—a chronicle of day by day, not a relation for a breakfast—will be handy for ready reference in every family. Fort Dearborn blockhouse is pictured on the front cover of 'Early Chicago,' and again at the conclusion of the volume. It had already stood nineteen years when our author was brought into Chicago, and in 1856 he saw it demolished. We cannot fail to share in his regrets that a facsimile of this oldest of Chicagoan relics, insuring safety to the feeble colony, was not exhibited at the World's Columbian Exposition, where it must have made a more touching local appeal than did La Rabida, the monastic refuge of Columbus.

Through the Heart of Patagonia. By H. Hesketh Prichard. With illustrations by J. G. Millais and from photographs. D. Appleton & Co. 1902. 8vo, pp. xvi., 346.

"Inexpressibly desolate and monotonous" is the general impression of Patagonia which this book leaves, though these words are used of a particular spot. Its vast pampas, hemmed in between an inhospitable, harborless coast and an inaccessible mountain range, is roamed over by only a few hundred Indians. The white man is to be found in some small towns, and here and there on a farm, measured not by the acre, but by the square league, and separated from his nearest neighbor by "often three, four, or five days' ride." Monotony also is a characteristic of Mr. Prichard's narrative of his eight months' wanderings through this dreary region, where "ever the wind shrills." In the absence of any striking incident or discovery, or of variety of life in the saddle and in the camp or in the hunt, he fills his pages with unimportant and tedious details. There are minute descriptions of his various horses, their color, dispositions, and escapades; more space being devoted to them than to the Indians. We are told, for instance, that one of them, in bucking, gave himself a deep wound in the pastern, and "Jones tied it up with his handkerchief." At a lagoon four ducks were shot, "which were plucked before we came into camp." To this statement a paragraph is given: "I saw one condor poised high." This verbose triviality is unnecessary, for the book, whose external attractiveness renders its contents the more disappointing, contains abundant evidence that had the author taken more time and pains and been content with a less pretentious volume, he might have made a useful contribution to the scanty Patagonian literature.

The discovery in 1895 of the skin of a prehistoric mammal, the Mylodon, or giant ground sloth, in a cave in southern Patagonia, had awakened the hope that the animal still survived in the Andean forests. To search for further evidence of its existence was the object of Mr. Prichard's expedition. He crossed the plain to the foot of the Cordillera in two different places, and explored a small forest tract

near Lake Argentino. In the open country there were no traces of it, and the apparent absence of all life, small or great, in the forest, more marked the farther he penetrated its depths, seems to warrant his conviction that it is extinct. "But there are hundreds of square miles of dense forests still unexplored along the whole length of the Patagonian Andes, and I do not undertake to declare positively that no such animal exists in some unknown and hidden spot among their recesses." In addition to this negative scientific result, he navigated a hitherto unknown river, a few miles in length, having its source in a mountain tarn, which he named Lake Pearson, after the proprietor of the *Daily Express*, to whose generosity the expedition was due, and shot a new sub-species of puma, now known as *Felis concolor pearsoni*.

Throughout Mr. Prichard's narrative are to be found entertaining descriptions of his experiences, though his adventures were few. He had comparatively little to do with the Tehuelches, but perhaps the best part of his book is his account of this Indian race, which, endowed with many fine qualities and a remarkable physique, is yet fast disappearing, victims of the greed of the liquor-selling trader. By nature courteous and peaceable, when under the influence of strong drink the Tehuelche becomes completely changed. If there be liquor at hand on some tribal festival, "the younger women, who never drink on such occasions, go round beforehand and gather up every knife, hatchet, or, in fact, all and any weapon they can find, and bury them in some hidden spot about the camp. This custom, which is in its own way pathetic, speaks for itself." There is also some reason to fear that the guanaco, upon which, with his horse, the Indian depends for his living, much as the Laplander depends upon the reindeer, is also doomed to extinction. More than once the traveller came to spots strewn with the dead bodies of hundreds of these animals killed by the winter frosts and snow, and he says that the "mortality among guanaco in a really hard winter is tremendous." But the white man, rather than nature, will probably be its destroyer, for the pampa is eminently adapted for sheep and cattle raising, and when there is communication by rail between the interior and the coast it will be covered with countless herds of cattle and flocks of sheep. Now it takes some farmers two months to bring their wool to a port and return to their ranch.

There are three excellent maps, and numerous illustrations, some of which are of unusual merit, while others are trivial and uninteresting.

The Family of William Penn: *Ancestors and Descendants.* By HOWARD M. JENKINS. A thorough and definitive presentation of the subject, executed with its author's well-known accuracy and thoroughness, mainly from original sources, especially the "Penn Papers." 300 pages. 19 full page steel-plates, photogravures and half-tones, . $3.50

FERRIS & LEACH, Publishers, Nos. 29-31 North Seventh Street, PHILADELPHIA.

E. P. DUTTON & COMPANY'S
New Spring Books

A New Book
By GEORGE GISSING
The Private Papers of Henry Ryecroft
12mo, cloth, $1.50 net.

Mr. Gissing's latest book is in the form of autobiographical papers of an imaginary writer. As to how much of this is the author's actual experience is left to the reader to decide. The papers are of one who has known hardship and the life of the literary hack and then has retired to the country and the companionship of books and nature.

Italy and the Italians
By EDWARD HUTTON. Illustrated. 12mo, $1.50 net.

This new book by the author of "Studies in the Lives of the Saints" is the record of one who knows his Italy and has the enthusiasm of the student and the artist.

Besides his chapters on Italy of the past, Mr. Hutton comments on the present state of affairs, showing that he is a careful observer.

The New America
A Study of the Imperial Republic. By BECKLES WILLSON. 8vo. $2.50 net.

"In these pages it will be my aim to point out broadly some of the new conditions and tendencies which appear to me to prevail in the United States of America. . . . Commentaries on conditions which pertained a decade or two ago bear an almost ludicrous disparity to the facts of 1902."—*Author's Preface.*

The First Volume in
The Temple Biographies
Now Ready

MAZZINI. By BOLTON KING. Illustrated. 8vo, $1.50 net.

"Gives good promise for the volumes to follow. Mr. King has treated a very difficult subject with much success. . . . The personality of Mazzini is brought out by many touches and details which add much to the interest of the volume."—*Spectator.*

Social Germany in Luther's Time
Being the Memoirs of Bartholomew Sastrow, translated by ALBERT D. VANDAM. Introduction by HERBERT A. L. FISHER, M.A. Illustrated. 8vo, $2.50 net.

These memoirs, written by a German Burgomaster in the sixteenth century, give a marvellously vivid picture of Germany under Charles V. Sastrow attended the Imperial Court at Augsburg, Spires, and elsewhere, and gives an astonishing account of the austere Charles and his corrupt surroundings.

Round the Horn Before the Mast
By A. BASIL LUBBOCK. Illustrated. 8vo, $2.00 net.

"A very realistic book, with a note of genuin ness. . . . He offers a faithful picture of life on shipboard day by day that has the freshness and breeziness of the sea in it It is a book that true lovers of the sea, old and young, should read and enjoy."—*N. Y. Sun.*

BICENTENARY EDITION, 1703-1903.

The Heart of JOHN WESLEY'S JOURNAL

By PERCY LIVINGSTONE PARKER. Introduction by HUGH PRICE HUGHES. Appreciation by AUGUSTINE BIRRELL.

There is no book in existence that gives so exact and vivid a picture of the Eighteenth Century England as this record Wesley kept of his daily experiences. It is a work of astonishing interest, ranking in permanent historic value with Pepys' Diary or Newman's Apologia. The Journal heretofore filled four volumes, a prohibitive bulk that Mr. Parker has condensed to this single cover.

Illustrated, 8vo, cloth, $1.50 net.

BY HIS LIFE-LONG FRIEND

THE LIFE OF JOSEPH PARKER

By WILLIAM ADAMSON, Author of "Life of Principal Morrison," etc.

"Like Beecher and Spurgeon, Joseph Parker swayed men by the genius of eloquence. His life is replete with incident and covers an amazing energy and industry. Mr. Adamson is a sympathetic biographer, and the prodigious labor Dr. Parker accomplished will amaze every one who reads the record here faithfully set down." —*Commercial Advertiser.*

Illustrated, $1.75 net.

INDIA'S PROBLEM: KRISHNA OR CHRIST

By JOHN P. JONES, D. D.

After twenty-five years' experience in India, Dr. Jones has produced a book noteworthy for its comprehensiveness, breadth of view and multiplicity of detail. It speaks with authority on the country and the people, the religions, the women, missionary organizations, resources, problems, and conquests.

Illustrated, $1.50 net.

LOST and RECLAIMED

MARY NORTH

By LUCY RIDER MEYER

Fresh from the innocence of a country home only to fall a victim to the snares of metropolitan life is the pathetic story oft told to Mrs. Meyer during her many years of work among her sex. "Mary North" combines the actual occurrences from the experience of many, and the awful conditions are squarely faced and fought. It is full of most thrilling, touching, and enthralling incidents.

Cloth, $1.50.

By WILLIAM ELLERY CURTIS of the Chicago Record-Herald

The Turk and His Lost Provinces

Sketches and Studies of Life and Travel in the Land of the Sultan

A traveler, newspaper man, and a man of letters given the keenest observation, Mr. Curtis has for years been one of America's foremost correspondents from abroad. In none of his travels has he been more deeply impressed or absorbed than by the Turk and his problems of Empire, and has given a certain timeliness to his treatment that embraces the political, moral, physical and religious trend and tendencies.

Fully Illustrated, 8vo, Cloth, $2.00 net.

American Barbarism and Chinese Hospitality.

Two Heroes of Cathay

Edited by LUELLA MINER.

The unique experience of two Chinese students of the cultured class whose case has recently attracted so much public attention. The barbarous treatment of them affords an unpleasant and unflattering contrast, for these boys repeatedly risked their lives for Americans on Chinese soil during the Boxer uprising.

Illustrated, $1.00 net.

By SIR ROBERT ANDERSON, author of "Daniel in the Critic's Den."

The Bible and Modern Criticism

Sir Robert Anderson brings legal training and acumen to bear on problems of biblical research.

With keen vision and cool logic he dissects the results of critical inquiry and takes the stand that the METHODS of the critics are fundamentally fallacious. The style is singularly lucid, and the argument relieved with telling anecdotes that are fully as cogent as the logic.

Cloth, $1.50 net.

A NEW SCOTTISH FOLK

DWELLERS IN THE MIST

By NORMAN MACLEAN

The Outlook Says:

"The people of the Hebrides, plain, homely, shrewd folk who still talk Gaelic and have many old ways of living and thinking. There is a good deal of 'red veined humanity' in these incidents of a minister's life among these people, and some episodes of dramatic force and passion. Mr. Maclean's work has individuality and reality."

Cloth $1.25.

An Immediate Success

The CIRCLE

By KATHERINE C. THURSTON

Illustrations by Reginald Birch

Price, $1.50

"A story of unusual power which opens in an obscure curio-shop in London, where Anna Solney, the sixteen-year-old daughter of an exile, is chafing bitterly against her enforced solitude and inactivity. When unexpectedly the opportunity so madly craved is offered her—the chance to take an active place in the busy world—she finds that the conditions which accompany its acceptance are only a degree less cruel than those involved in its rejection. Eight years later she returns, and to the girl standing in the shadows it seemed that the circle of life was complete. From the neutral tints she had passed through every graduated shade that existence can possess, revolving slowly past the faint light tones of hope and expectation to the vivid colors of actual fulfilment, then from the vivid colors steadily and inevitably forward, to be confronted once again by grayness and shadow. The shadows pass, however, and the constancy of her lover eventually brings to Anna the realization of a rarely perfect love."

The Mail and Express *says:*

"THE CIRCLE justifies the high hopes based upon it by its English and American publishers."

The New York Journal *says:*

"It is a welcome relief from the haunting historical novel, written with so obvious a view to dramatic rights."

The Commercial Advertiser *says:*

"From the opening page THE CIRCLE fairly tingles with life and action and pent-up energy."

The New York World *says:*

"For the interest and the workmanship that are in it, THE CIRCLE must commend itself highly."

The Nation.

NEW YORK, THURSDAY, MARCH 12, 1903.

The Week.

A few years since, in the Speakership of Reed, the country was startled by the announcement that appropriations to the amount of one billion dollars had been made by one Congress, and somebody dubbed it the Billion-Dollar Congress. This phrase seemed likely to create some prejudice against the Republican party, until Mr. Reed offset it by saying that this was a billion-dollar country. The Republicans rallied at that thought, and actually did recover from the temporary depression that had overtaken them. Now, Senator Allison tells us that the appropriations of the Congress which has just expired have been more than a billion and a half ($1,554,108,518), but he adds, apologetically, that fifty millions is for the purchase of the Panama Canal. If we subtract this item, however, the remainder still exceeds a billion and a half, and it is needless to tell us that there has been an increase of $50,000,000 in the cost of the postal service, which includes an extension of the rural free delivery. The postal service is not properly included in the spending departments of the Government. Only the difference between receipts and expenditures should be placed in the budget. This deficiency, Mr. Allison admits, is smaller than it has been in many years. To sum up the situation, this is now a billion-and-a-half-dollar country, and it will be a two-billion-dollar country as soon as the revenues will allow it to become such.

Resentment was the prevailing mood of the Senate on Thursday—first against Congressman Cannon, who had characterized as "legislative blackmail" Senator Tillman's hold-up of the General Deficiency bill in behalf of a South Carolina claim; next, against the American people at large, who, in the opinion of the speakers, are adopting a tone of impertinent criticism towards the ways of the upper house. Whether Mr. Cannon's rebuke of the Tillman hold-up was technically correct or not, it was just—and this irrespective of the nature of the claims upon which the reporting of the Deficiency bill was made to hang. To obstruct in the last moments of a session a necessary bill in order to push a private claim, is a kind of brigandage that is very mildly qualified by Mr. Cannon's phrase "legislative blackmail." Because this practice is also called "the courtesy of the Senate" is no reason why the House should adopt such euphemisms. Congressman Cannon has spoken uncomfortable truth, and that is why Senators Tillman, Hale, and Allison devoted the early hours of a special session to berating him.

More significant than this personal passage was the evident fact that these influential Senators fully realize the extreme unpopularity of the Senate, and resent it while they marvel at it. Mr. Tillman told complacently of his hold-up; he had "shut his jaws down on the proposition," which under the rules of the Senate he rejoiced that he had a right to do. Senator Hale deplored Mr. Cannon's words, and especially the implication that such opinions had the country behind them. Mr. Allison was in a higher mood of indignation, and, remarking that the Senate rules had served for a hundred years, said the Senate would not change them for any "outside body." But how if that body were the people of the United States? That is the situation which the Senate must soon face. One of their own number, Mr. Foraker, has told them so roundly. The air of uneasiness which pervaded the speeches shows that the Senate has begun to see how other people regard it.

Was ever the most august assembly on earth, as the Senate loves to call itself, in so little august an attitude as it confesses itself to be in the matter of the Panama Treaty? The melancholy Republican leaders say that it is rapidly narrowing down to a question of killing the treaty or killing Morgan. He has not a single new argument to present, not one consideration or proposed amendment that has not been threshed to dust. Not even his friends maintain that anything he can say will affect the judgment of a solitary human being—yet he is to be allowed to say it, world without end. Five hours a day are now assigned him, and at that rate he may be getting well into his subject by April 1. Yet the dismayed Senate protests, in the fulness of its courtesy, that it cannot put greater pressure upon Morgan. A "continuous session" might be fatal to him, it is explained, at his age and in his state of monomania. But we should advise the Senate to take the more cheerful view of an "exalted personage" whose saying has been going about Washington. "You say that it would kill Senator Morgan if the Panama Treaty were ratified. But do we really need that added argument for ratification?"

Senator Lodge was prompt to resent Senator Hoar's demonstration, the expiring Congress being the *corpus vile*, that our form of government unfits us to legislate for 8,000,000 unrepresented people, 8,000 miles away. We are just as able to deal with that "problem," said the junior Senator from Massachusetts, as with "the greater and mightier problems before." But Mr. Lodge forgot that what the occasion called for was not a stump-speech boast before the fact, but an explanation of admitted failure after it. Are Imperialists to be like the poet's "Man"—"never is but always to be blessed"? The last campaign was the time for valiant predictions of the wise and benevolent things Congress was going to do. Senator Lodge made them then in the roundest terms. The work of fulfilment was placed in his own hands. It was no Little American, but Lodge himself, who was given the job of showing, as Senator, what, as historian, he had denied could be done—that is, a people across the sea governed satisfactorily by a Parliament in which they had no representation. But the great man, the enthusiastic tackler of "problems," failed miserably when the real trial came. He should be the last man to take a braggart tone now. Let him not rail at Senator Hoar, but at the hard facts. What the natural inference from them is has been stated by Mr. Brewster Cameron—special representative, we believe, of the Manila Chamber of Commerce. He declares:

> "The fact that the Congress of the United States, controlled by men in sympathy with his political views, is not willing to act upon the recommendations of a man like William H. Taft—particularly when those recommendations are cordially approved by a War Secretary and a President who have the full confidence of the American people—will cause many thoughtful men who have heretofore believed in holding fast to the Philippines to pause and consider whether, after all, we are capable of giving a wise and just government to a people ten thousand miles away."

In the Senate of the United States on January 28, Senator Proctor of Vermont presented an elaborate defence of Capt. Cornelius M. Brownell, who was charged with the murder by torture of Father Augustine, a Catholic clergyman in the Philippines. This defence was written and signed by Capt. Brownell himself. Senator Proctor added to it some remarks of his own, declaring that Brownell was "fully justified in taking any steps he saw proper for the safety of his command," etc. Now comes a review of Brownell's conduct by Judge-Advocate-General Davis, who, after an investigation, says that Brownell was not justified by any military necessity, and that his only duty in the premises was to hold Father Augustine as a prisoner of war. It appears from this high military authority that Brownell had no duties to perform at the time when his villany was executed, except to maintain order in the town where he was stationed, and that he tortured Father

Augustine to extract information to satisfy his own curiosity. Then he sums up the military view of the case by saying that "the taking of human life under the circumstances above disclosed constitutes one form of felonious homicide which is triable by military commission, by a general court-martial, and, in certain cases, by a civil court having criminal jurisdiction." Thus it appears, when the bottom facts are reached, that the charges of cruelty resulting in death, preferred against Capt. Brownell, for which the anti-Imperialist committees and newspapers have been so often censured and called slanderers of the army, have been confirmed, and more than confirmed, by the highest authority in the army. Torture of prisoners is never justified, but if it were ever justifiable, it was not so in the case of Father Augustine. Now who is the slanderer of the army? we beg to inquire. Is his name Herbert Welsh, or Carl Schurz, or Charles Francis Adams, or is it George B. Davis, Judge-Advocate-General, U. S. A.?

President Roosevelt's letter explaining his policy of negro appointments has received the almost unanimous endorsement of the Republican press. A part of the approval expressed is merely perfunctory; but here and there is a flash of the old enthusiasm for human rights. Mr. Roosevelt's doctrine of "all men up," as against "some men down," could not but stir the hearts of those who believe in equality of opportunity for talent of all kinds. Even the Southern newspapers have had to admit that the President is "theoretically right." But some of them quibble beautifully. The Mobile *Register*, for example, asks: "When is a man 'fit' for office? Mr. Roosevelt believes that if the man has character and ability he is fit"; but the *Register* goes on to argue that "fitness has a meaning of its own," and is not "merely a synonym of the other two words." That meaning is, in the last analysis, that you can pronounce a man unfit if you do not like him. "You are not fit, Dr. Fell; the reason why I cannot tell."

Two events, pregnant of ill to the State of Delaware and to the country as a whole, took place on Thursday. Mr. J. Edward Addicks was appointed by the Governor of the State to be a trustee of Delaware College, and William M. Byrne was nominated again by President Roosevelt as District Attorney. All the reasons why Byrne should not have been appointed four months ago remain of full force, with the additional one that the Senate Judiciary Committee reported adversely to him. The choice of a notorious briber as trustee of a college is a crime against the youth of the State and the country. In taking this step, the Governor has advertised himself as a corruptor of the morals of the rising generation. Far better would it be to send Addicks to the Senate, where only grown men would be exposed to his example and his teachings, than to place him in a position where he may be looked up to as a guide and monitor by boys at the impressionable age of college life.

At last Pennsylvania is going to have ballot reform, and we are bound to admit that Quay should have the credit of it. It goes by the name of the Quay Ballot Reform bill, as it ought, for when he decided that only high-souled statesmen should hold public office, he made enough of an exception to keep control of the Legislature. It is only fair to record that Quay's new friends feel that the bill which is about to become law is not quite all that they would have it. Its principal feature is that it changes the voting space from a circle to a square. Quay is "squaring the circle," irreverent persons are saying in Pennsylvania. But every one must realize that reforms come but slowly, especially in the Keystone State. And, of course, there are other changes. The names on the ticket are rearranged, and the sheet made smaller. To be sure, independent voting is rendered more difficult than before, but doubtless Quay did not think of that. "While disappointing to a great many," says the Philadelphia *Press*, "it can be accepted as a step in the right direction. There are various influences to be taken into account." Of course there are! That is one of the advantages of consorting with a man like Quay. You no longer go out into the dark and stumble over "various influences." You have them right at hand.

A strike of trainmen and firemen on the Wabash Railway, which had been in contemplation for some weeks, was on the point of being declared on Tuesday week, when an injunction was issued by Judge Adams of the United States District Court at St. Louis against the leaders of the Trainmen's Union. It commands them, until the further order of the court, absolutely to desist and refrain from ordering, coercing, persuading, inducing, or otherwise causing the employees of the Wabash Railway Company to strike or quit the service of the company. The injunction was obeyed, and the traffic of the company continues without interruption. There was a time in the history of the labor troubles and labor organization in this country when it was possible for the employees of a railway to desist from work without any warning whatever, and leave passengers stranded midway between stations, or to abandon a cattle train in a snowstorm, leaving the animals to perish from hunger and cold. The courts put a stop to that kind of strike, and organized labor itself acknowledged the justice of the proceeding, or at all events made no protest against it. No authority was assumed to curtail the liberties of workingmen to demand and enforce their rights in an orderly way, not inconsistent with the rights of other members of the community, but merely to postpone hasty action which might work irreparable injury to persons having no share or interest in the dispute. Judge Adams, we infer, has but applied this rule to the threatened strike on the Wabash Railway. At all events, his injunction is only temporary.

The anarchy which now always dogs the heels of a great strike has roused the citizens of Waterbury, Conn., to unusual efforts. They perceive that they have to protect the good name of their town, union-ridden as it has been of late years, as well as their own lives and property. Responsibility for the cold-blooded murder of a policeman who was guarding a car in charge of a non-union conductor and "scab" motorman is, of course, repudiated by the labor leaders. They profess great indignation that unionism should be thought capable of such a crime. As in the case of the outrages and murders in the coal regions, they challenge "legal proof" that any conspiracy to murder existed, or that any "member in good standing" was guilty of the foul deed. We presume that, at Waterbury as in Pennsylvania, it would be held a sufficient exculpation if the detected murderer should prove to be a member who was behind in his dues. That, as anyone can see, would clear the skirts of unionism. All these renewed sophistries and evasions are cut through, however, by a stroke of common sense. To whom was the murdered policeman offensive? Who thought of him as an enemy to be removed? In what atmosphere of hate and ferocity were engendered the passions which directly led to the murder? Everybody knows the right answers to these questions. It was the intolerant, the tyrannical, the unscrupulous spirit of unionism which fired the shot at the guardian of the non-union men. This was the case, whether it shall be proved or not that the revolver was actually held by a union man. The murder was the natural and fitting culmination of the long series of acts by desperadoes which were confessedly the weapons of unionists levelled at free laborers, and which have been bringing reproach upon the lax and timorous authorities of Waterbury.

As Mr. Goldwin Smith says, with accustomed pungency, in his letter in Tuesday's *Sun*, "whether the cause of the union is the cause of labor, can be determined only by allowing the laborer *freely to decide* whether it is his inter-

est to belong to a union or not. His judgment is not free if refusal exposes him to persecution." Goldwin Smith is entitled to speak on this subject, for he is one of those soldiers of liberty who fought out the battle of freedom of association for the workingman. With Bright and Cobden he stood against the oppressive combination laws which made it a crime for laboring men so much as to confer together to advance their own interests. And he now affirms that not one of that group of greatly daring Liberals who contended, under much obloquy and odium, against the laws which gave landlords and employers a monopoly, would have countenanced for an instant the modern attempt to create a monopoly of labor. Swift would have been the condemnation of those men for acts of labor-union violence—and its various disguises, as boycotting, picketing, or social ostracism of the non-union laborer—and great would have been their pain and astonishment at beholding the very classes whom they had striven to free from coercion, themselves turning coercionists of the most violent sort.

The action of the Steel Corporation's management, in deciding to carry out their much-discussed stock-conversion scheme, is greatly to be regretted. As all well-informed people in financial circles know, there is far less excuse for the plan to-day than there was when it was proposed a year ago. Regarding that part of the new bond issue which concerns the raising of $50,000,000 fresh capital for improvements, Judge Gary's statement as to the needs of the property will carry deserved weight; though even here it must be observed that the accretion, within the past twelve months, of upwards of $30,000,000 of "undivided earnings" should have made possible the reduction of borrowing demands. For the plan of converting $200,000,000 preferred stock into bonds—a plan already condemned by the best financial judgment—no defence is offered in the directors' circular, beyond the well-worn argument that interest on 5 per cent. bonds is 2 per cent. less than dividends on 7 per cent. stock. It has been intimated that the management itself wished to abandon a plan which the year's events have made not only needless but unwise, but that it found itself bound by its contract with the underwriting syndicate, and could not, therefore, change its policy. This is a possible explanation. Under that contract, the syndicate engaged last April to deliver, in exchange for a portion of the projected bonds, at least $20,000,000 cash and $80,000,000 preferred stock. In return for such services, the syndicate was to receive from the company a cash bonus of 4 per cent. on all bonds placed in accordance with the plan. Since the profit thus involved might amount to the very respectable sum of $10,000,000, it would not be at all surprising if the underwriters had stood on the terms of the contract, and it may be that their legal claim is impregnable. We doubt, however, if such an explanation will avert criticism.

A symposium of German professors on the Monroe Doctrine has produced more sound and fury than sweetness and light. The professors in council pretty generally committed themselves to the Middle-European theory, advocating a coalition against the "empty pretensions" of the United States. But these doctors disagree badly as to the scope of the central European confederacy. Professor Wagner, an economist at large, feels that the object of attack is Anglo-American preponderancy. "The world's civilization would hardly be advanced thereby." His bitter remarks, unwise and unjust though they be, are but the natural comment upon extreme Imperialism, whether British or American. Still another *Gelehrter* would like to see the Anglo-German alliance made permanent as against the United States. The editor of the Berlin *Post* finds that the blessed Doctrine is a "non-binding monologue, whose enforcement is purely a question of force," but he holds that Germany's interests are so little involved in the question that it may be dismissed as academic. In this German discussion, strangely enough, the part of wisdom has been left to the pessimist philosopher Eduard von Hartmann, who opines that it would be unpopular in Germany to speak well of the Doctrine, unpopular in America to speak ill of it; hence, that "silence is best."

The attempt to continue the unnatural alliance which has carried the tariff bill through the Reichstag is a striking tribute to the strength of the Socialist movement, against which the coalition is directed. It may be that fear of Socialism will cement a cabal composed of such incompatible elements as National Liberals, Anti-Semites, and Agrarians, but it is equally true that everything points to a corresponding increase in the strength of the Socialists. The scandalous food taxes, which must inevitably bring distress, the impediments thrown in the way of reciprocity treaties which might stimulate export of manufactured articles—this whole programme of industrial oppression pleads loudly the cause of social reform in all the cities of the Empire. In the election of 1898, the Social Democrats had a substantial plurality of the votes cast. Just how many votes they will add to their 2,120,000, or how many seats to their present 56, is matter of sheer speculation. But since the German proletariat has real and substantial grievances, and since the German Socialists have excellent leadership and a moderate programme of reform, it is certain that the movement must grow, despite temporary hostile combinations of the minor parliamentary groups. In fact, this tripartite alliance against Socialism will unfailingly recall to a whimsical observer a bond between an engineer, a fireman, and a stoker, to sit on the safety valve and prevent the escape of steam.

Professor Holland, who teaches international law at Oxford, points out that the Venezuelan protocols still leave it in doubt whether Great Britain was ever at war with Venezuela. The British Government seemed to cling to its theory of "unfriendly pressure" and "reprisals," as accounting for all that occurred. Professor Holland disposes of this by one knock-down argument. Prize courts were set up in Trinidad to pass upon captures, and prize courts necessarily imply a state of war. Even Lord Lansdowne appears to have been dimly aware that something very like war was going on, since one clause of the protocols provided that any treaty between Venezuela and Great Britain which "may have been abrogated by war" should be renewed. Professor Holland argues for more explicit and straightforward proceedings, contending that it is "surely desirable that henceforth Great Britain should know, and that other nations should at least have the means of knowing, for certain, whether she is at war or at peace."

To Roman Catholic Christianity, so perfect is the continuity of its traditions, it would make comparatively little difference whether Leo XIII. or another Pope were celebrating his twenty-fifth anniversary. The gorgeous display under Michelangelo's dome would be the same. Thousands of prelates in splendid robes would represent the ecclesiastical pomp that befits the head of a universal church, armored guards and equerries would keep up the requisite show of royal state, and the acclaiming multitude would represent that desire for spiritual leadership upon which, in the last analysis, all organized religion rests. What makes the present solemnity interesting to all thoughtful people, Christians or otherwise, is the man Joachim Pecci, not the Pope. In that ardent spirit lightly held in a frail body they see, first, a man of simple and apostolic piety who has carried into modern times the graceful scholarship of an Æneas Sylvius, and a Pontiff who has led a great church out of the toils of political intrigue prepared for it by Metternich, and onward into sympathy with society and government as they actually are. How important this exaltation of the moral as against the bureaucratic function of the Church has been is only beginning to be understood. Such considerations give to the ceremonies on March 3 a more than œcumenical significance.

LARGER ASPECTS OF THE LATE CONGRESS.

In passing judgment on the Fifty-seventh Congress, it will be wiser to look at its general influence and drift than merely to reckon up the number of bills passed, slain, or mutilated. Rival partisan cries always confuse the issue of fact. "You have been prodigal." "No, we have not." "The people will soon turn you out as unprofitable servants." "No, they won't; they will be too busy keeping *your* party out." These vain disputes profit us nothing. In actual work done, Congress has given us the usual mixture of sweet and bitter. We may thank it for a failure to act at all on the Ship-Subsidy bill; we may praise it for its beginnings of Trust regulation and for its measures of army reform—just as we must condemn it severely for its callous neglect of the Filipinos; but, after all, the more deeply and permanently interesting questions are, What political and public tendencies does the late Congress exemplify? How does it stand before the country as reflecting the national will?

We think that the two years just ended at Washington have marked, on the whole, a further abasement of the power of the House, as compared with the Senate. This has been partly due to its being in the hands of small men. Like Speaker, like House. Vacillating incapacity in the Chair goes well with fluctuating irresolution on the floor. But there is a deeper reason. Senators are more and more coming to dominate the House through their control of whole "delegations" in it. How can the House be expected to stand out against the Senate in a great matter of legislation on which Senators have set their hearts, when Quay and Platt and Hanna can walk over and whip their forty or fifty puppets into line? This is one of the ways in which the overshadowing Senate has grown more towering. Secretly controlling, because Senators have created, a large element in the House itself, it casts a grosser shadow every day.

Yet, with its swelling power, the session has shown it to possess a deepening disrepute with thoughtful men. Congressman Cannon, in his impassioned manner, uttered the thoughts of many hearts when he denounced the way in which the Senate delivers itself—and the public business—bound and gagged, into the hands of the unblushing obstructionist or the unscrupulous corruptor. The Senate has broken down in its own theory of "courtesy" as the solvent of all difficulties and the best agent in the dispatch of public affairs. So like the methods of highwaymen has the courtesy of the Senate appeared during the last few weeks; so shameless the arrogance and disregard of the general interest displayed; so humiliating and even disastrous the result, that it is no wonder the whole situation appears almost intolerable to Senators themselves. Unless they mend their manners or change their rules, it will soon appear altogether intolerable to the country.

In the matter of the relations of Congress and Executive, we have seen still further examples of what is called, on the one side, "Executive encroachments," and, on the other, "a firm discharge of the duty of the Chief Magistrate." Whatever we call it, or whatever we think of it, the fact remains that the President had to fling himself upon the late Congress, and exert his influence in all manner of open and indirect ways, in order to secure from its grudging hand the legislation which he and the people demanded. In many cases, even his impetuous urging could not make Congress budge; but the constant pressure has excited friction. Everybody who goes to Washington and has confidential conversation with Congressmen, is struck with the extraordinary bitterness of many of them towards Mr. Roosevelt. A frequent query of theirs is, "How can we keep that man out of the White House after his present term?" This intense hostility grows partly out of questions of patronage; but more out of the way in which the President has sailed his own course, and so often brought Congress up with a round turn. It pervades the entire party organization of Congress down to the very doorkeepers, who make no concealment of their hope that Senator Hanna will be the next President. The whole phenomenon is certainly one of the most striking facts connected with the Fifty-seventh Congress.

Fully as significant, however, is the total failure of the Congress to live up to the boasts and the promises of our Imperialists. As an organ of government for distant colonies, it has shown itself altogether a disappointment and a delusion. No Expansionist can deny this, for it stands written on the record. Out of President Roosevelt's own mouth let an Imperialist Congress be judged. At least three capital measures did he urge upon Congress as a portion of our "world-policy"—the interoceanic canal, the Cuban treaty, the Philippine Tariff bill. These were an essential part of that great mission which we are to play whether we want to or not. But Congress could tell Mr. Roosevelt a thing or two about that. It took his great-mission bills and threw them into the rubbish heap. He solemnly reminded it of the "responsibilities" which it had assumed, but it couldn't have run away from them any more cavalierly if it had been his own dearest foe—the "weakling."

Why should this surprise us? Our country's very existence is a standing protest against the notion that colonies can be justly governed across the estranging sea. That idea fails to-day with us, just as it failed with England and her American colonies, and with Spain and hers. We send our best Governor to the Philippines; but when he emphatically warns us that our course is one of perilous neglect, we treat his appeals and his protests just as England treated Franklin's, or Spain Polavieja's. In other words, Congress stands to-day a confessed failure, in the eyes of Imperialists themselves, as a source of wise and healing legislation for distant subjects. What our forefathers asserted to be the necessary fate of a people governed against their will and without representation, we are now proving in the sad experience of our Philippine subjects. Disagreeable as it would be to President Roosevelt to confess this truth, by at once calling the new House in extra session, as well as the new Senate, and demanding the passage of the bill which Gov. Taft certifies to be vital to the welfare of the Filipinos, that way duty, if not strenuosity, lies.

NEGROES AND POOR WHITES.

President Roosevelt's prompt renewal of the nomination of Dr. Crum will compel the new Senate, with a Republican majority of twenty-four, to face a question which the last Senate endeavored to shirk. That question is whether the colored man of education and character is to be recognized and encouraged, and through him his race encouraged. Behind this individual case there lies, of course, the large principle at stake. Is the attack on the negro's political rights to include an assault upon his personal rights? Is his disqualification for office to go hand in hand with his disfranchisement? Is he to be thrust back, instead of helped, when he tries to rise? These are the issues now looming large before the Republican party, and it could not put them by if it wished.

In approaching their discussion and settlement it is necessary to look fairly at the situation in the South. The apparent solidity there in opposition to the colored man's struggle upward is not real. Evidence abounds that the best Southern people do not share that intense hostility to the negro's aspirations which has been voiced in so many an intolerant utterance by Southern newspapers and Southern Congressmen. For negro education, in particular, is there widespread sympathy among intelligent Southerners. They show it in word, and deed, and gift. The heads of institutions for the education of colored youth testify in the strongest way to the active encouragement and support which they receive from the finest white citizenship about them. There is undoubtedly a philanthropic class of Southerners who not only think kindly of the negro, but labor intelligently for his uplifting.

This brings us to the striking fact that the most violent and clamorous pro-

tests against equality before the law for the negro come from the "poor whites" of the South. (We use the term for identification, merely, not by way of reproach.) It is they and their spokesmen who are most intemperate and inflammatory. Senator Tillman is their apostle. If not exactly a poor white himself, it was at any rate as the representative of that class that he rose to power. It was the more ignorant and prejudiced white vote of South Carolina which enabled Benjamin Tillman to wrest political control from the old white aristocracy of the State. He exalted himself by humbling the Hamptons and Butlers, and driving them out of public life. This must be borne in mind when weighing the words of this man. He does not speak for the entire South, but for a Southern class. The Lamars, the Gordons, the Haygoods, the Currys—in general, the intellectual and moral aristocracy of the South—would repudiate Tillman's extreme positions as indignantly as the best people of the North.

This, however, does not lessen the ominous significance of the stand taken by the South Carolina Senator. Speaking for his class, he declares opposition not only to negro office-holding, but to negro suffrage; not only to negro suffrage, but to negro education. In his speech in the Senate on February 24, he made it all too clear that the poor whites of the South dread and hate the rise of the negro to better things. The only good negroes in Mr. Tillman's eyes are those who quietly work for the white man and "do not know anything about the elections." It was all very fine, he said, for the President to talk about not shutting the door of hope and opportunity to the black man, but if you opened it to the negro, do you not see that you would be shutting it in the face of his white brother? What the poor whites really want was declared without ambiguity by Senator Tillman. They want the negroes to remain in ignorance and degradation, so that they may continue as a sort of serviceable peasantry in the South, and never rid themselves of "that feeling of *subordination* which is their only salvation."

The bearing of this on negro education is obvious. Senator Tillman is frank enough and logical enough to see whither his argument tends. He perceives that, if the educated negro is not to be permitted to rise, then it is criminal folly to educate him at all. Accordingly, he admits that the educational qualification for the suffrage, adopted in so many Southern States, was designed only as a makeshift to suppress the negro vote. It was only a "temporary" expedient, says Senator Tillman; and he is now in a state of great alarm over the increasing number of negro graduates from public schools who are able to pass the educational test. The idea of an intelligent electorate—when *colored*—appalls Mr. Tillman. "Every man who can look beyond his nose can see that, with the negroes constantly going to school, the increasing number of people who can read and write among the colored race . . . will in time encroach upon and reach and overbalance our white men." This is the fear which makes Senator Tillman assert that the sufficiency of the educational solution of the race problem in the South can be believed in only by "shallow thinkers." His remedy would be to shut the negroes out of school as well as out of office. This shows how essentially and necessarily the movement against the political rights of the negro is a movement to force him back into ignorance and barbarism. This is not slavery, it is said. "Subordination," the wise it call. But, however named, it is evident that the poor whites of the South are bent on putting it as a yoke upon the colored race, which they would keep in a condition of tacit helotry, hewers of wood and drawers of water for ever.

THE WALL STREET FLURRY.

There are people in Wall Street who believe that the prevailing stringency in money is due to the failure of the Aldrich bill, and to the large drafts of the Treasury on the cash reserves of the banks. This opinion prevails extensively among those who are carrying on margin large blocks of railroad and industrial bonds which they have been unable to sell. The load of these securities resting on the market is enormous. It is impossible to make any close estimate of the amount, since nobody knows how many have been worked off since their first issue. They consist largely of new securities which are intended to take the place of old ones, but which have to be first converted into money; in part, also, of new undertakings such as additional tracks and terminal facilities for railways, and still more, perhaps, for the purchase of small roads to serve as branches of large ones. The total amount which has not yet reached the hands of investors who will hold them for the sake of the income they bring, ranges in the hundreds of millions of dollars. The securities are generally of a good class. They earn their interest. In an ordinary market they would pay for their own carrying. The only trouble is that there are too many of them. The resources of the banks were never so large as now, yet they have their limits. The demands upon them are apparently without limit, and Europe has been called upon from time to time to make up the difference.

According to the best estimates obtainable, our floating indebtedness abroad at midsummer last year was between four and five hundred millions. In one way and another this had been lessened about one-half at the beginning of the present year, and would have been reduced to manageable proportions ere this time but for an unexpected phenomenon, the freight blockade. This element in the financial situation has not received the attention that it deserves. Enormous quantities of grain have been stopped between the producer and the consumer for the want of cars, locomotives, and rails. Wheat that was started from the farms last December and sent five hundred miles eastward is still en route. Offers have been made by shippers in the West of 2½ cents per bushel above the published rates, for the transportation of corn to any seaport beween Boston and New Orleans. The grain elevators on the lakes are full to bursting, and here we find another drastic call for money. If all of this stuff could be moved it would all be paid for, and would *pro tanto* liquidate our indebtedness abroad. The part which cannot be moved must be carried by the banks. The "hurry call" from the West for money two weeks ago must have had some connection with the congested condition of the grain trade, and this congestion cannot possibly be relieved before the opening of lake navigation. The fact is, that our railroads were built and equipped for the conditions of twenty years ago. In the interval, great cities have doubled in population and more than doubled in productive power. Facilities of transportation have not increased in like proportion, and, generally speaking, terminal facilities have not increased at all. The latter, being the most expensive additions of all, are generally the last ones attended to, and here we find the most stubborn element of the freight blockade.

The payment of our floating debt abroad grew less and less, and finally came to a halt, and now we are borrowing back the same money we had once paid. Europe is willing to let us have it at a price. Time money was loaned to New York borrowers by Berlin last week at 5½ per cent., and even 6 per cent. was quoted in that market on Saturday. Of course, such rates cannot be paid forever on collaterals which earn only 4, 4½, or 5 per cent. The situation must work its own cure. There is money enough in the world to absorb at some price all the surplus bonds that are really earning their interest. Both American and European investors will take them when they think that the bottom has been reached. Dropping the price, however, is a delicate matter, like taking soundings on a lee shore during a fog. The investing public usually go in droves. They buy when prices are rising, and abstain when they are falling. They are abstaining now, not because they do not consider the goods worth the prices asked, but because they believe that some of the present holders will be obliged to sell, and

that then better bargains can be made. They are probably right in so thinking.

In the face of the enormous calls for money to carry this accumulation, the takings of the Treasury are of small account. And what do these takings signify? They represent the consumption of goods by the American people. They are imposts and excises (cuttings-off) which the Government takes as its share of commercial transactions. The greater or less amount which the Government takes is symptomatic of the condition of trade at any given time. At the present time they point to a condition of general prosperity. It is something like mockery to tell a man whose note at the bank, backed by good collaterals, is called, that the country is prosperous. Yet that is the fact. Whether the flurry in Wall Street shall continue or subside, the economic condition of the country is sound, of which fact the freight blockade is additional testimony coincident with the large receipts of the Treasury. The London *Times* is right in saying that our business world has "bitten off more than it can chew," if that phrase is limited to the manufacture of stocks and bonds, but not if it applies to the production and exchange of the useful commodities of civilized life.

MODERN MEDIÆVALISM.

It is more than likely that most Americans heard for the first time the name of Gaston Paris through the inadequate obituaries printed in Friday's papers, yet the news of his death will bring to scores of scholars in our colleges and universities that peculiar sense of loss which comes when a leader dies. For Gaston Paris illustrated in its perfection, if he did not originate, a new and fruitful attitude towards the study of the Middle Ages. The time will come when scholars will study the Mediæval Renaissance, which throughout the nineteenth century runs curiously counter to the ever increasing current of natural science, as they now study the Classical Renaissance. Such investigators will discover that the first generation of Mediævalists, whom we may represent roughly by Bishop Percy of the 'Reliques,' by Herder and the Schlegels in Germany, by Scott and Hugo in fiction, and Ruskin in art, all approached the Middle Ages in the spirit of sentimental travellers. They welcomed the ring of Roland's horn and the flash of Siegfried's brand, or the naïve beauty of an allegory by Giotto as a relief from the periwigged Catos and Cæsars, and, in general, from the conventional Olympus of the eighteenth century. The world was weary of the clarity and common sense of Voltaire, and found solace in the mysterious land of Arthur or the strange doom of Tristan and Isolde.

There was a mixture of motives in the enthusiasm of the first mediævalists. They loved the literature and the art of the Middle Ages for its romantic quality, which they greatly exaggerated, and for its unlikeness to the art of the followers of Boileau and Pope. They also found the fund of mediæval legends an inexhaustible quarry of fresh and attractive material for literature. Scott in a score of works, Hugo in 'Notre Dame de Paris' and 'La Légende des Siècles,' our own Longfellow in the 'Golden Legend' and 'Tales of a Wayside Inn,' discovered to the world a little part of the neglected treasures of the Middle Ages. None of the men of this school really understood or cared to understand the material with which they were dealing, any more than the ardent tourist, glutted with new sensations and impressions of beauty, cares to break the spell of enjoyment with the chill of analysis. They had at best proved that the Middle Ages offered much of interest, that Beowulf deserved some consideration beside (say) Ajax, and that the courtly Gawain was not, even in comparison with Ulysses, a negligible personality; they had at most rather asserted than proved that it was as reasonable to consult our nearer origins in the Middle Ages as it was to seek the remoter sources of our culture in classical antiquity.

While these excursions and alarums of the littérateurs were in progress, hundreds of obscure scholars throughout the civilized world were following tardily the example of Muratori, and actually publishing the remains of mediæval literature and art. The first effect of this work was a revulsion of feeling. Studied more narrowly, the Middle Ages lost much of their mystery. The men were very like ourselves. Their literature was at times puerile, and not seldom tedious; their architecture, despite the impassioned pleading of Ruskin and the saner advocacy of Viollet-le-Duc, not adapted to our modern needs. There was and is danger that all who concerned themselves with things mediæval should get a reputation for mole-like industry and corresponding stupidity.

The lifework of Gaston Paris is a refutation of any such short-sighted view. He saw, as Jacob Grimm had seen before him, and as his master, Diez, had shown him, that the Middle Ages must be studied comprehensively as the record of a common and highly intricate civilization. He saw that no single literature could be understood by or for itself. He made it his task to trace the action of literature upon literature. Thus, in one of the most delightful of his popular essays, he shows how the Celtic poets gave to the story of the fated lovers, Tristan and Isolde, its ruder form, how the Normans of England modified the legend in a romantic direction, how the Germans decorated and interpreted it, until the French prettified it out of all resemblance to its original state. Nor is his study complete with the courtly poets of the twelfth century; he analyzes, in conclusion, the modern (one might say, neglecting chronology, the *fin-de-siècle*) atmosphere of pessimism which Wagner wove about this primitive legend of ill-fated love.

No one will fail to note how in such a study erudition and human interest go hand in hand. M. Paris took all mediæval knowledge to be his province. He followed his material, most frequently an episode of the great legend of Arthur, through a dozen literatures. Old Irish, Welsh, Old English, Icelandic, German, French, Spanish, Italian —no pertinent document or version was neglected in his survey. Even in the more special articles which he published in his journal, *Romania*, one frequently had the exhilarating sense of dealing with a living thing. To him a legend or heroic tradition was not merely a literary oddity. It was a growth which, upon a slender basis of history, came into being in answer to the needs of a people. It was an organism that had the power to slough off superfluous members, to graft upon itself foreign material, to lose itself in some greater legend cycle—all of these transmutations arising in obedience to the thought and feeling of the men of the Middle Ages. This mere hint of M. Paris's point of view should suggest its value. He hoped to ascertain the mediæval spirit as definitely as classical scholarship has assimilated the Hellenic or Roman spirit. There is no need to compare the two fields of study. Enough that both are humane, and that the mastery of any alien civilization is in a sense a doubling of the personality of the investigator.

It was consonant with the comprehensiveness and humane intention of this new mediævalism that its most distinguished representative found time, while indefatigable in his production of special works, to fulfil the public duties of an Academician, the large administrative responsibilities of the Directorship of the College of France, to dispense a gracious hospitality to all literary Paris and its guests, to train hundreds of students in his methods; finally, to make accessible to the cultured public his most important results in essays on mediæval subjects which are a model of classic structure and grace.

MIDWINTER LOAFING IN JAMAICA.—II.

PORT MORANT, February 3, 1903.

The journey from Port Antonio to Mandeville, where my previous letter was dated, may well be broken at Spanish Town. The island was discovered by Columbus during his second voyage, in 1494, and tradition still points out the spot where he careened his ship. The Spanish domination lasted considerably less than half of the four centuries that have since elapsed, for in 1655 Admiral Penn, the father of our William, came out at Cromwell's behest and made Jamaica a British dependency; and thus the names of the two capitals, Spanish Town of the past and Kingston of the present, suggest in briefest epitome the history of the island. Spanish Town is, in very deed, of the past, and "Ichabod" is writ staring on its walls; but not, I must admit, on the walls of its charming little inn, the Rio Cobre, for of that hostelry the "glories are" not yet "departed." A superb Royal Palm adorns the space before the main entrance; the verandas are cool and shady, the rooms airy and clean; and the bath-tanks (you can hardly call them tubs) of cumbrous masonwork are uncommonly inviting. The food and cooking, too, are distinctively Jamaican: you may have yams done to perfection—that is, without a trace of sogginess—or fried ackie (its toothsomeness, I suspect, like that of sweetbreads, is adscititious), or stewed guavas with cocoanut cream (toothsomeness, *per contra*, intrinsic!); and for dessert you may, after your banana pudding, have a glass of "matrimony," or make it yourself by mingling in a large "schooner" the pulp of an orange with that of a custard-apple. I am seated near several young men (Norwegian and German) who have come hither from the technical schools of Berlin to serve as chemical experts in the dyestuff

factory. A letter from the Fatherland is given to one of them, and, holding it in a hand that is stained very black, he reads it with an expression that makes one surmise that, despite tropical scenery and luscious fruits and good pay, life here to him is exile indeed.

After luncheon and a leisurely siesta, I visit the cathedral church of St. James of the Plain (Santiago de la Vega). It is an impressively venerable structure. The enthusiasm of the verger, perhaps more loving than judicial, referred one part of the transept to the year 1530; a critic in Kingston made short shrift with that claim, but the solid mahogany roof-timbers of the (much younger) nave are so black as to suggest great antiquity to the unrestrained imagination of the laic. The aisles are paved with the sepulchral tablets of old-time notables, and the inscriptions, well worn by the footsteps of the devout, are now literally the "fading honors of the dead." A rickety "buggy" takes you to the somnolent market, to the superb statue of Rodney that commemorates his victory over the French fleet in 1782, to the King's House, once the residence of the Governors, the worthy scene of many a stately function, and so finally to the quiet railway station.

The first few miles offer convincing evidence as to the value of irrigation. On our left are extensive plantations of logwood trees, and the well-watered acres are green and flourishing with unnumbered tons of the precious dyeware; while on our right the land stretches dry and sear in almost painful contrast. The irrigated acres have recently quadrupled in value, they say, and I can well believe it. The train passes under the arches of a beautiful old Spanish aqueduct. It looks as if it were modelled after the Roman one at Segovia in Old Castile; and one might marvel at the age and directness of a human tradition that reaches from the Campagna of 312 B. C. to St. Catherine's parish of now, were it not for the thought that our planet is, after all, but a chick-pea in the cosmos, and recorded human history not half the tick of many a celestial clock. Be all that as it may, Jamaican railway journeys at longest are short. From Spanish Town to Williamsfield, where we leave the train, is about forty-one miles, and a run of two hours. An hour and a half is spent on the first thirty-five; that brings us to Porus, where the climb begins in dead earnest, and the remaining half-hour is spent on the remaining half-dozen miles. As miles of horizontal progress they count for six, but they include also nearly nine hundred feet of progress in the vertical. At Williamsfield we enter a "buggy" and are fairly whirled upward for another eight hundred and more, over the splendid roads, until at last, behind horses that steam in the chill evening air, we alight at the lodgings of Mrs. Halliday in Mandeville.

Apart from climate and flora, there is much in Jamaica to remind you of India. There are coolies (ten thousand and more), with bangles on their arms, and on their walls Sanskrit or nāgarī characters, a script that almost startles you here at the antipodes of the pandits. One sign, as I remember it, was "Dan Pattie a Coolie man," evidently the Sanskrit Dhana-pati, 'Lord of wealth,' and having as little to do with Daniel and Patrick as the "wealth" had to do with stocks and bonds. The country beds are springless couches on which is laid a mat of rushes or leaf-fibre, thus answering to the seetalputty or 'cool mat' of Bengal. The fewness of the birds is very striking, and, if you ask the reason, you are told that the mungoose was imported from India to exterminate (*à la* Rikki-tikki-tavi) the snakes; that he did his work no less effectively than Kipling's little hero; but that he then devoted himself to the birds and their eggs, and that even now he does not discriminate properly between birds and poultry. This was more than the Jamaicans bargained for, and yet all the time there were Sanskrit fables, millenniums old, to warn them against precisely such a contingency! Even the place-names suggest India. Mandeville recalls the shadowy Sir John and his wanderings on the way to Cathay; and was not Porus the Hindu King famous for his quick-witted answer to Alexander the Great? "How would you be treated?" asked the victor. "Like a King," said Porus.

The sights of Mandeville are not the "work of men's hands." They are the distant hills and mountains, and the sky. But I visited the market on market-day. There you shall see women who have walked a dozen miles with a basket of yams on their head; donkeys laden with most unrefined loaves of native brown sugar, and with a look of indifference to joy or to sorrow on their faces that would do credit to a Buddhist saint; ropes of tobacco at "thruppence" a yard; fruits that attract and meats that repel; for indeed the shambles were enough to subdue to vegetarianism the carnivorous instinct of the rabidest beef-eater. You wonder that the methods of exchange and distribution should still be so primitive, and—perhaps, rather loftily—you contrast them with those obtaining at Park & Tilford's or at Wanamaker's.

It was a discovery fit for a wandering New Englander's Sunday to find that every one of our company of eight at Mrs. Halliday's was from New England; and pleasantly suggestive of Cambridge and home to hear in the evening Longfellow's "Psalm of Life" read aloud from a collection that lay in the common room. To me it was a vivid reminder of my honored colleague and neighbor and friend, Charles Eliot Norton, to hear by odd chance, immediately thereafter, the charming idyll of his father, Andrews Norton (1786-1853), entitled, "After a Summer Shower." What Harvard student of to-day thinks of Cambridge as the possible setting for an idyll? Its quiet roads, its lanes, with grassy walks and borders of trees, are gone; "progress and improvement" have given us instead noisy tracks of steel, pavements of brick bordered with massive posts and foliage of wire—all as little suggestive of poetry as is the lumbering water-cart that lays the pungent dust. Norton's lines, sweet with the smell of woods and field, are a poem, and a document as well, and deserve to be remembered elsewhere than in Jamaica.

We bestir ourselves Monday long before sunrise. To be awake at that hour in the tropics is not unworth the while, if for no other purpose than to see the splendid stars, their quick and silent fading out, and the glories of sunrise. That very sight gave the *motif* for one of the oldest poems of our race, a hymn of the Rig-Veda, of which one verse (1. 50. 2), Englished quite closely, reads:

> "Off—like as robbers—slink away
> Yon constellations with their beams
> Before the all-beholding Sun."

The moderns will not greatly improve the description. Broad daylight finds us jolting prosily along in our train, and, as we near Kingston, the business men join us. One of them, a little lawyer, engaged in conversation by my companion, berates the Torrens system of land-registration, now in force here, for its possibilities of injustice, quite in the manner of much more intelligent, and so less excusable, conveyancers nearer home.

The day at the capital passes quickly with sight-seeing and the buying of knick-knacks. For the boys you must take home machetes, the big chopping-knives that look so murderous, and are, in fact, used so generally for the most peaceful operations of husbandry; and for the girls you take brown-faced, West India dollies, and some little ippi-appi hats, the latter durable enough to serve for the dollies of the granddaughters of those same girls. If, otherwise than by personal observation and inquiry, you want to learn facts about the island, get the 'Handbook of Jamaica for 1902, comprising historical, statistical, and general information concerning the island,' by T. L. Roxburgh and Joseph C. Ford. It is issued by the Government Printing-Office at Kingston, and is in its twenty-third year of publication. The most important guide to other sources of information is doubtless the 'Bibliographia Jamaicensis,' by Frank Cundall, Secretary of the Institute of Jamaica (New York: G. P. Putnam's Sons). This is a well-arranged collection of over eleven hundred titles, set under such rubrics as history, descriptive accounts, biography, natural history, medicine, agriculture, trade, law, folk-lore, fiction, etc., and is obviously indispensable for any serious student. The Institute Library is rich in works on Jamaica; and among the exhibits of the attractive museum are the papers which were found in the maw of a shark, and which led to the condemnation of the brig *Nancy*, in 1799—ocular evidence of an occurrence such as has formed the cardinal incident of many a romantic tale of ancient and modern times.

Our steamer quitted Kingston harbor early this morning for Boston, calling here for the day at Port Morant for a few thousand more bunches of bananas. As we turn to enter the bay, the air is filled with delightful fragrance, and I am told that it comes from the blossoms of the logwood trees on the somewhat distant shore. The supercargo, at leisure for an hour or two, is a man of intelligence, and tells me not a little of his happy life on an estate of 993 acres of which he has the leasehold; and something, too, of the banana industry. He was sanguine in his prophecy of fortunes for the men who shall successfully utilize as paper fibre the enormous masses of banana stalks that now rot on the ground. As to the reason why Congress maintains an import duty on bananas he was discreetly reticent; perhaps it is for the protection of some growers of this hardy fruit on the sun-kissed slopes of Nahant!

It may interest others than myself to know that the custom obtains here for the tenant or sub-tenant to pay the taxes to the Government directly, and not through the hands of his landlords. How often with

us is the tenant of an apartment, or even of a stately house, looked upon, not only by others, but even by himself, as a non-taxpayer, because, forsooth, he makes no direct remittance to the collector! And what possibilities of improvement in our municipal life inhere in the Jamaican custom! If only the day laborer could be brought to see that the money squandered by dishonest officials is his money, earned by his toil, how much more keenly alive to the need of good public housekeeping might he not become! But our bananas are aboard, the night is falling, the steamer rounds the point, and, thrusting her bow into the billows of the northeast swell, she heads for Cape Maysi and home. C. R. LANMAN.

Correspondence.

WANTED—AN INDIVIDUALIST PARTY.

TO THE EDITOR OF THE NATION:

SIR: "Politics," according to George IV., "is a poor trade for a gentleman." It certainly is, if he tries to think consistently. In politics, if he appeals from what seems to be the immediately expedient to principles, the ultimately expedient, he is "doctrinaire." If he is in opposition to the general trend, he is "negative"—like the ten commandments, and about as unpopular. If he points out evils, he is "pessimistic." Let him believe that our Legislatures might better be employed in repealing discredited statutes than in passing similar measures to be discredited, and he is not "constructive." Should he oppose tinkering, he is scoffed at as "laisser-faire." Without offence, he may ably discuss any single question; but if, in its discussion, he hints at the existence of a coördinating thesis—a central unifying idea—in his theory of politics, he is "not practical." If he gives the public something that is not kindergarten, he commits the unpardonable sin—he is "academic." In politics, the personnel, with praiseworthy exceptions, is what might be expected from the philosophy.

Disraeli, the tricky, once said with a complacent smirk, "This country is governed by Parliament, and not by logic." If he should come to earth again, none of our Legislatures would offend him by their excessive addiction to logic. But a change is coming. As the Barbarians were a beneficent scourge to Rome for cowardly living, the Socialists will prove a needed corrective to us for our cowardly thinking.

There are two great basal principles of political action—Socialism and Individualism. Two parties are needed to represent these principles. The Socialist party is doing effective work by forcing vacillating politicians into definite positions. An Individualist party—call it Republican, if you wish: the name is not important—it is to be hoped, will soon be formed. The day is coming when the people will say to both the great parties, in the strong, old-fashioned words of Scripture: "I know thy ways, thou art neither hot nor cold. I will spue thee out of my mouth."

JAMES DOOLING.

NEWTONVILLE, MASS., March 5, 1903.

CULTURE, OR SOMETHING AKIN.

TO THE EDITOR OF THE NATION:

SIR: I have been greatly interested in "Agatha's" 'Observations in a Big University,' and in Fanny Purdy Palmer's addendum thereto under the heading "Culture and 'Commonness.'" With many of the views expressed I am in closest sympathy; but, as a graduate from one of those "big Western universities," I protest against any final judgment being pronounced upon them or the results of their training when only the two witnesses, "Culture" as defined by Matthew Arnold, and "Commonness," have been heard.

If to be truly cultured one must be engaged in "the disinterested pursuit of perfection," then few of the graduates of our Western universities are or may ever hope to be cultured. Arnold's definition of culture may adequately define the culture of one who is always and only to be a scholar; but if the word be limited to his definition, we shut out a "something" which comes to the life of every earnest student who spends four years in a big university—a something which we have made bold to call culture.

Our Western universities are receiving young men and young women from country homes and from small villages, and giving them opportunities to come in touch not only with the brightest minds among their fellows, but with the matured and broadened intellects of professors and teachers; they are enlarging the horizon of life for thousands of boys and girls, and giving them sound views on the relative values of things with which they will come in constant contact in their future lives. In spite of the frivolity which "Agatha" deplores, these big Western universities are teaching the majority of their students to attack difficult problems with courage and zeal, and to hold to them until they are solved. If this mental and spiritual breadth and depth, the soundness of judgment and courage of spirit—in short, the power to meet life as it faces each of them in future years, and to meet it victoriously—if this spirit, which is developed in our big universities, be not "Culture," it is something very worthy to take its place.

JEANNETTE BOYNTON STORMS.

MADISON, WIS., March 4, 1903.

A MISFIT.

TO THE EDITOR OF THE NATION:

SIR: From a letter published in one of your recent issues, written by Mr. Jones of the Salem Public Library, I notice that he has had some difficulty in using the index to the American edition of Alderson's 'Andrew Carnegie.' I mistrust that the American publishers, in resetting the work from the English edition, have "followed copy" in the case of the index without replacing the references by new paging. If Mr. Jones had purchased the English edition, he could have imported it for 56 cents, instead of paying $1.26 (library rate for the American edition), and would have had a copy in which the index would "work."

Very truly yours,

GEORGE F. BOWERMAN, Librarian.

WILMINGTON INSTITUTE FREE LIBRARY, WILMINGTON, DELAWARE, March 4, 1903.

THE "FIRST NOVEL" SERIES.

TO THE EDITOR OF THE NATION:

SIR: My attention has just been called to a review of a novel published by Messrs. McClure, Phillips & Co., in your issue of February 5. It is described as being a volume in the "First Novel" series. I certainly am much surprised to see this announcement, as this is the title of a series we originated now some twelve months ago, the first volume in which, 'Wistons,' by Miles Amber, was published in New York by Messrs. Scribner, and the other volumes in the same series have been published in New York by Messrs. Appleton and Messrs. Funk & Wagnalls. Under the circumstances surely there must be some mistake; I cannot believe that another publishing house would adopt the title and style of a Library issued by a confrère, even though he be an Englishman.

Yours truly, T. FISHER UNWIN.

11, PATERNOSTER BUILDINGS, LONDON, February 19, 1903.

Notes.

'The Development of Muslim Theology, Jurisprudence and Constitutional Theory,' by Prof. Duncan B. Macdonald of Hartford Theological Seminary, is in the press of Charles Scribner's Sons for speedy publication.

From McClure, Phillips & Co.'s spring list we select an abridgment and rearrangement in one volume, by George Gissing, of Forster's Life of Dickens; 'Life and Destiny,' by Felix Adler; 'The Prayers of Dr. Johnson,' edited by W. A. Bradley; 'The Flower Garden,' by Ida Bennett; 'A Book of Travel,' before the mast, by Albert Sonnichsen; 'American Industrial Problems,' by W. B. Lawson; and 'George Douglas Brown: Unpublished Papers and a Memoir.'

Twenty-six studies of American character constitute Mr. George Ade's new book, 'People You Know,' in the press of R. H. Russell.

The Arthur H. Clark Co., Cleveland, have nearly ready, in "The Historic Highways of America," 'Braddock's Road,' to be followed by 'The Old Glade Road' and 'Boone's Wilderness Road'; also, the first of the 55 volumes of 'The Philippine Islands, 1493-1803,' edited by E. H. Blair and J. A. Robertson, with an introduction by Prof. E. G. Bourne.

The "universal language" is not dead yet, as witness 'Esperanto: The Student's Complete Textbook,' containing full grammar, exercises, commercial letters, and two vocabularies, compiled by J. C. O'Connor, B.A., and to be published immediately by Fleming H. Revell Co.

From Richard G. Badger, Boston, we may expect Julius Wolf's metrical romance of 'Tannhäuser,' translated by Charles G. Kendall; 'Vita,' a drama, by Grace Denio Litchfield; and a large number of books of verse.

Francis P. Harper will publish early next month a 'History of Early Steamboat Navigation on the Missouri River: Life and Adventures of Joseph La Barge,' in two volumes, illustrated by Capt. Hiram Martin Chittenden. It will form No. 4 of the "American Explorers Series."

The season's output of A. C. McClurg &

Co. embraces 'An Index to Poetry and Recitations,' based on more than 300 standard and popular collections; 'A Selection from the Best English Essays,' with introductions and an historical and critical study of English prose style, by Sherwin Cody; 'Reflections of a Lonely Man,' by A. C. M.; 'The Souls of Black Folk,' by Prof. W. E. B. DuBois, of Atlanta University; 'The Law of Mental Medicine,' by Dr. Thomas J. Hudson; Felix Dahn's 'Felicitas,' translated by Mary J. Safford; and 'Cartoons by McCutcheon,' from the Chicago *Record-Herald*.

Lemcke & Büchner announce that they will publish, for America, the *editio princeps* of one of the oldest manuscripts of any Greek author, Timotheus of Miletus, the 'Persæ,' from a papyrus recently found at Abusir—unfortunately the second half only. It has been edited by U. von Wilamowitz-Moellendorff. Hitherto only a few quotations from this work have been known. A facsimile edition will be issued with a short introduction, and also a text edition with a very full introduction, a philological commentary, a paraphrase in scholiastic Greek, and *index verborum*.

The Wallace collection at London has been the subject of many illustrated works, but none of these have been so ambitious as the folio announced by Goupil & Co. The entire work will be printed on Japanese vellum; the plates will be 100, of which twenty will be colored in "Goupilgravure." It will be issued in ten parts, with duplicates of the plates on India paper. The edition is limited to 100 copies, and the price thirty dollars a part.

Walter Jerrold's edition of Thackeray's Prose Works (Dent-Macmillan) proceeds with his 'Paris Sketch-Book.' The illustrations are rather notable—a handful by Brock, including a counterfeit of Philipon's pear-shaped caricature of Louis Philippe; a copy of Burnard's bust of Thackeray; and the author's own "Ludovicus Rex," or royalty robed and disrobed.

The sub-title "First Folio Edition" gives the reason for a new issue of Shakspere by Charlotte Porter and Helen Clark. The text is a literal reprint of the First Folio, all additions by the editors or from the quartos being inclosed in brackets. Emendations and various readings are relegated to the foot of the page, though rejected variorum readings have an especial appendix. The notes are very full, and also the glossary, while there is a department of "selected criticism." This is said of "A Midsommer Nights Dreame," which, neglecting the order of the First Folio, begins the series. The volume is of pocket size, and satisfactorily made by Thomas Y. Crowell & Co. It should be acceptable to all readers of antiquarian taste, for Shakspere as his editors and their printers spelled him is not easily accessible. But the careful editors of the present series have been unfortunate in departing from their principle in printing not the portrait from the First Folio, but the so-called "Droeshout Original" portrait at Stratford. This panel will undoubtedly turn out to be only an oil transcript from the print, as Mr. John Corbin intimated some time ago in an article on the Shakspere portraits at Stratford.

The printer's device or trade-mark, which seems to have been suppressed almost entirely by general consent during the seventeenth and eighteenth centuries, was revived by William Pickering of London, about 1830, and has been steadily growing in favor ever since. The Gillis Press of New York has made the trade-mark of that house the subject of a neat little book ('The Story of a Motto and a Mark') explanatory of their device, with its legend in Italian which may be thus freely translated: "Trifles make perfection, but perfection is not a trifle." This legend is attributed to Michelangelo. Several examples of the devices of early printers are introduced to illustrate the subject more clearly. It is a misfortune that some of these illustrations have been reduced too much; they give form with correctness, but are deficient in light and shade, and do not fairly illustrate the strength, clearness, and breadth intended by the designer. Over-reduction in photo-engraving is a common evil which makes the reader lament the decadence of engraving on wood. A design painted with a brush, of the size 16x20 inches, or a print, in the original 4x5 inches, has a different appearance in a book illustration when reduced to the size of 2x3 inches or less. Accuracy of form is preserved, but light and shade are damaged. Pale grays and dark grays become confused and foggy. Excellent presswork has diminished the bad effects of too much reduction in the Gillis Press book, which is in many features a bit of beautiful workmanship, and contains bits of valuable information.

The *Studio* (New York: John Lane) publishes 'Representative Art of Our Time,' which is to be completed in eight parts. Each part is a large paper-covered folio containing half a dozen plates—original etchings, engravings or woodcuts, and reproductions in color of oil or watercolor paintings, pastels, or chalk drawings. This is a publication with an air of sumptuousness and importance, but little of the work contained in it is really remarkable. "The Bather," an original mezzotint by Marx Pietschmann, is the only plate in the three numbers now before us which we have found at all inspiring. The work is edited by Charles Holme, and each number contains a monograph on some branch of art. Thus, we have had, so far, "The Modern Aspect of Wood-Engraving," by Charles Hiatt; "The Modern Aspect of Artistic Lithography," by Joseph Pennell, and "The Future Development of Oil-Painting," by Percy Bate. The last paper amounts to little more than an admission that we know nothing about its subject, while Mr. Pennell confines himself to a lament that the cost of printing is a severe tax on the artist-lithographers and a discouragement to original effort. Mr. Hiatt takes the ground that the day of wood-engraving as a reproductive art is over, and that this fact is not to be regretted. The future of wood-engraving is with the original artist who executes his own designs, specially made for their adaptability to the art he practises, instead of endeavoring to imitate the quality of designs made in other materials by artists who are not engravers. The same thing might be said, with equal truth, of lithography, mezzotint, etching, or any other of these arts. "Process" has killed them all as popularizers of work in other materials, and they can exist in the future only by virtue of their intrinsic artistic qualities as independent productions.

'Albrecht Dürer,' by Lina Eckenstein, is the latest issue received by us of "The Popular Library of Art" (London: Duckworth & Co.; New York: Dutton). The little volume, though not equal in interest to those on Rembrandt and Rossetti, is yet an acceptable addition to the series. The illustrations are good and well chosen, though one misses the "Melencolia."

By his choice of Murillo for treatment by himself, in the Bell-Macmillan "Miniature Series of Painters," the general editor, Dr. Williamson, again marks his preference for sentimental painters of little force. Other recent issues in this series are devoted to Greuze, to Millais, and to England's one draughtsman, Lord Leighton. They are by Harold Armitage, A. L. Baldry, and Dr. Williamson respectively, and conform closely to the uniform method of these useful little books, each containing a chapter on the life of the artist dealt with, a second on his art, and a third on "Our Illustrations," the whole concluded with a list of chief works.

The 'Watteau' of this series, by "Edgcumbe Stanley," has been revised and considerably enlarged, and is now brought out as one of the "Great Masters in Painting and Sculpture" by the same publishers. We are glad to see that the somewhat ludicrous errors in the printing of French words and phrases, which we commented upon, have been corrected.

Mr. Charles Sprague Smith's 'Barbizon Days' (A. Wessels Co.) consists, with the exception of a few pages of personal reminiscence of the village and the neighboring Forest of Fontainebleau, of chapters on the life and work of the four artists, Millet, Corot, Rousseau, and Barye, compiled from various sources, mostly accessible enough, and containing little that is fresh, and next to nothing that could be claimed as original. The book is pleasantly written and quite readable, however, and seems to be accurate. The illustrations are partly from the works of the artists discussed, and partly from photographs of their homes and haunts, and are well executed. Altogether, this survey will be welcomed by many.

Mr. Edwin M. Bacon has no superior in New England guide-book making, and one may confidently accompany him in his 'Literary Pilgrimages in New England' (Silver, Burdett & Co.). Eastern Massachusetts, as the frontispiece map shows, is the principal territory, being that in which our guide is most at home. The "scheme" involves a tutor or mentor and an eager youth, and, if not new, is skilfully managed. The abundant illustrations are nearly all photographic, and all significant—portrait or place. The work, compact with information and much pertinent quotation, may be commended for use in schools as well as by "pilgrims."

Mr. Clifton Johnson, who has cleverly employed his camera in fixing phases of country life at home and abroad, sometimes in books with a text of his own, now trains it on *tableaux vivants* for the illustration of Jacob Abbott's 'Rollo at Work' and 'Rollo at Play,' for school purposes (American Book Co.). Some of the pictures are half-tones, others pen-and-ink sketches upon photographs. The revival is interesting, and is made more so by a brief introduction by Dr. Lyman Abbott, paying

a filial tribute to his father in all his dealings with children.

William S. Lord, Evanston, Ill., publishes 'The Western Slope,' a book of social and character studies by Mrs. Celia Parker Wooley, whose name is better known in Chicago than in New York and Boston, except as she has been a preacher in Unitarian pulpits and a writer for Unitarian journals. Her 'Western Slope' is the downhill of life (Mrs. Child's 'Looking Towards Sunset'), taking for its starting-point Dante's "Mezzo del cammin di nostra vita." Her lucubrations have a wise and genial character, and are touched with a pleasant humor. The book has the charm of conversation with a highly cultivated and very agreeable person. Its best part is a series of chapters on "The Way We Have Come," religiously, socially, and as concerns the status of women; the third of these chapters being particularly sensible and just.

Prof. Franz Boas continues his record and translation of Indian legends in 'Tsimshian Texts, Nass River Dialect' (Bulletin 27, Bureau of American Ethnology). These stories were collected from four individuals in the latter part of the year 1894. The form of the Bulletin is substantially that employed in the 'Kathlamet Texts,' recently issued; here also the transcription of the Indian sounds is attempted.

Under the title "Italia Artistica" the *Istituto Italiano d'Arti Grafiche* of Bergamo (publishers of the admirable little monthly, *Emporium*) has begun a series of illustrated monographs of Italian cities, under the direction of Sig. Corrado Ricci, director of the galleries of the Brera in Milan. Two volumes have already been issued: 'Ravenna,' by Corrado Ricci, and 'Ferrara e Pomposa,' by Giuseppe Agnelli. In the month of March are promised 'Venezia,' by P. Molmenti; 'Girgenti,' by S. Rocco; 'Segesta e Selinunte,' by E. Manceri, and, we believe, 'Urbino,' by R. Lipparini. In size and get-up they so resemble the series of monographs entitled "Land und Leute," published by Velhagen & Klasing of Leipzig (New York: Lemcke & Büchner), that it is hard to believe they are not modelled upon it. The volumes issued are attractive in appearance, abundantly and well illustrated, and modest in price (frs. 3.50). The name of Sig. Ricci is also an earnest of good work in the text. It were to be wished, however, that to the succeeding volumes an index should be added.

That time proves the worth of a good thing is freshly illustrated by the posthumous success of the late Herman Grimm's thoughtful novel, 'Unüberwindliche Mächte,' the third edition of which has just been brought out by Grimm's literary amanuensis, Prof. Reinhold Steig (Stuttgart: Cotta; New York: Lemcke & Büchner). This novel, which in so striking a manner depicts the influence exerted by American democracy upon a highminded German nobleman, should be of particular interest to American readers on account of the approaching Emerson centennial. For there can be little doubt that one of its characters —the benign, enlightened, optimistic hermit of the Catskill Mountains, "Mr. Willson"—is an adumbration of what Grimm conceived Emerson to be; and it is remarkable how true to life this ideal portrait is.

The Free Religious Association, by the way, of which Emerson was one of the founders, will celebrate the centennial of his birth by devoting the principal session of its annual convention in May to the subject of Emerson's Religious Influence. It will hold an Emerson Memorial School or Conference for three weeks in July, beginning July 13, with morning sessions in Concord and evening sessions in Boston. Concord will celebrate the anniversary for itself on May 25, and Boston the evening previous, under eminent auspices. Finally, for the present, Charles E. Goodspeed, Boston, will bring out in season for the birthday 'The Personality of Emerson,' by Frank B. Sanborn, in a limited edition, with an etched portrait (standing) after David Scott's Edinburgh painting of 1848.

Prof. August Sauer, the well-known literary historian of the German university at Prague, has collected his occasional addresses and essays under the title: "Gesammelte Reden und Aufsätze zur Geschichte der Litteratur in Oesterreich und Deutschland' (Vienna: Carl Fromme). As may be expected from the editor of the works of Grillparzer, he has made this poet the centre of his disquisitions and reflections. There is an oration, delivered at the Grillparzer centennial, which attempts a survey of the whole of the poet's activity; there is a lecture on his relation to Katharine Fröhlich; there are essays on various of his dramas, such as "Medea" and "Libussa," and there are a number of essays on other Austrian writers which bring out all the more clearly the central position of Grillparzer in Austrian literature of the nineteenth century. The whole book is distinguished for its sound and sympathetic attitude, and its entire freedom from captiousness and caprice.

No. 21 of the *Palaestra*, edited by Profs. Alois Brandl and Erich Schmidt, consists of a valuable monograph, by Dr. Karl Detlev Jessen of Harvard University, on 'Heinse's Stellung zur bildenden Kunst' (Berlin: Mayer & Müller), which brings out the curious position of this eighteenth-century novelist and art critic as standing midway between classicism and romanticism. A violent opponent of Winckelmann's apotheosis of Greek art, at the same time an ardent admirer of Lessing's 'Laokoon,' Heinse possessed sufficient breadth of artistic sympathy to become on the one hand one of the first apostles in Germany of impressionism, and of the unbounded expression of the national temper in art; on the other hand, a worshipper of the ideal and the eternally human. We need not be surprised, therefore, that he could do justice to Rubens as well as to Michelangelo, to Raphael as well as to Claude Lorraine. The greatness of Rembrandt, however, seems to have remained hidden from him. It is to be hoped that Dr. Jessen will follow up this interesting study with a complete view of Heinse's life and work.

Mr. Caspar Whitney's *Outing* finished its fortieth volume last September, and now comes to us bound in a spring green. It is a mine of sporting illustration, narrative, and information, from "Women in Athletics" to "Photographing Wild Birds and their Young"; from automobiles to angling and the saving of drowning persons.

In the Harvard College reports of President Eliot and his associates for 1901-02 there is the usual food for reflection and the customary stimulus in presentation. The President's statistical ingenuity is freshly displayed in a computation, for half-a-dozen classes from twenty-five to thirty years out of college, of their reproductive capacity. The result shows that nearly 30 per cent. of the graduates remained unmarried; that their children averaged about two to a pair, and that the male children did not numerically replace the class membership; Harvard could not live by Harvard alone. The materials are now pretty ample for extending this inquiry, both at Harvard and in her sister institutions. We must confine our further selection from this instructive volume to the section in Dean Briggs's report entitled "Lack of Guidance for Freshmen." We quote two sentences: "For a freshman, when he first faces the elective system, the danger of mistakes is grave." "A suggestion to the Faculty that specimen programmes of study might help both students and advisers, found little favor last year in the Faculty as a whole."

—Mr. John Burroughs, in the March *Atlantic*, does a bit of keen-edged reviewing in the field of recent books on Natural History. Ernest Thompson Seton and the Rev. William J. Long are the chief objects of attack, the former mainly for the mingling of fact and fiction with no easily traceable line of demarcation, the latter for crass ignorance of his subject. President Hadley continues his discussion of "Academic Freedom in Theory and Practice." Much friction, he thinks, is traceable to the union of incongruous functions in the American "faculty." He would eliminate ordinary discipline, athletics, intercollegiate relations of undergraduates, etc., by placing all such matters in the hands of a committee chosen either by graduates alone or by students and graduates in unison. Some disentanglement also he would find for the functions of teaching and examination, of prescription of courses and nomination of professors. By development on these lines much trouble might be avoided, but, for the difficulties growing out of the relation to teaching of present or prospective donors, no sure method of avoidance is yet in sight. J. T. Trowbridge's "Own Story" covers in this issue his early years in Boston, and is of great interest. Raymond L. Bridgman pleads earnestly for a "world-legislature" to attend to world-business and promote peace, but his plea will hardly be commended to popular favor by the assertion that a world-judiciary, and in time a world-executive, with adequate means of securing revenue to meet expenses, would naturally follow.

—Mr. John Corbin opens the March *Scribner's* with a plea for the Twentieth Century City. As Mr. James has set the Londoner to discoursing of the richness and color of the atmosphere about him, so may our American cities gain in beauty if some artist will but body forth to our dull eyes the beauties which they already possess. Mr. Corbin makes a telling presentation of much that is beautiful in New York, but is not altogether convincing in his attempted apology for the Flatiron Building. When he asks if it is not true that the treatment is fine, "granting the subject and the proportions," one is reminded of the enthusiastic Texan who set up the claim that his State was just about perfect, "barring the

lack of water and good society." "Yes," answered a crusty fellow-traveller, "and when you come to think of it, water and good society are about all that is lacking in the infernal regions." Justice Brewer's article on the Supreme Court of the United States is interesting for its indications of the author's point of view on some of our great constitutional problems. For instance: "As one reads some of the propositions which are advanced, he is inclined to believe that the instrument possesses an elasticity which would make the manufacturers of india rubber choke with envy." It might have been more profitable, however, to give a more thorough and systematic presentation of the place of the Supreme Court in our governmental machinery, and its methods of working. The editor contributes a very readable essay on the subject of deafness, its advantages, disadvantages, and obligations. Russell Sturgis takes up again the subject of American pottery, to which he devoted a paper four months ago.

—Abbey and Swinburne once more have the place of honor in *Harper's*, with "King Richard II." as their text. The key to Swinburne's comment on the play is promptly presented in the first sentence: the play discloses a time "when the one unequalled and unapproachable master of the one supreme art which implies and includes the mastery of the one supreme science perceptible and accessible by man, stood hesitating between the impulsive instinct for dramatic poetry . . . and the facile seduction of elegiac and idyllic verse." But Swinburne is fairly out-Swinburned on the next page, where he points out a fault which, "if mortal manhood may venture to pass judgment on immortal godhead, I must say that Shakspere does not seem to me to have seen." It may be questioned whether a less hysterical commentary would not better accompany Mr. Abbey's pictures and contribute more to an intelligent appreciation of Shakspere—if mortal manhood may venture to appreciate, etc. Two papers of antiquarian interest display possibly more enthusiasm than scientific caution—one of them an attempt by Stewart Culin, curator of the Museum of Science and Art, University of Pennsylvania, to support the aggressive title, "America the Cradle of Asia," and the other an account by Giacomo Boni of recent excavations under his direction in the Roman Forum. One can hardly avoid a lively interest in the ardent Director, "underground, following intuitively in the track of Cæsar"; but archæology by intuition needs pretty careful checking up by more material tests. The "real editor" and the occupant of the Easy Chair discourse entertainingly each on a topic supplied by the other. A step further would give us a genuine dialogue between the two, which would certainly form an interesting diversion for this day of literary novelties.

—'The Shroud of Christ' (Dutton) is elaborately discussed in a handsome quarto of 170 pages, from the French of Paul Vignon. Since 1898, when the shroud was exhibited and photographed at Turin, it had been the subject of several French pamphlets and of a larger Italian work by P. G. Sanna Solaro. The cloth may be identical with one mentioned in 1203 as preserved in Constantinople; but its definite history begins in 1353, when Geoffroy of Charny and Champagne, who had been a crusader, gave it to the abbey of Lirey, near Troyes. Skeptical bishops questioned its authenticity, and Clement VII. pronounced it a copy of the original. About 1450 it was given to the Duke of Savoy. In 1532 it was injured by fire at Chambéry. Since 1578 it has been at Turin, locked in a metal casket, and displayed only on great occasions, as seven times in the last century. The Besançon shroud, destroyed in 1794, is believed to have been a mere copy of this. Lacking historical evidence, the value of the Turin cloth could be approximated only by investigation, which first became possible in May, 1898. The prepossession against alleged relics of course weighed with the educated; but "the markings on the shroud were found to have the characteristics of a photographic negative, in that, on the photographic plate, which reverses the lights and shades, a positive portrait revealed itself," such (it was thought) as no mediæval painter could have produced. In 1900 M. Arthur Loth, Laureate of the Academy of Inscriptions, called attention to these facts in a pamphlet, which "the religious world received with reserve, awaiting the decision of science." Historical scholars took up the matter, and the reluctance of physicists, or some of them, was overcome. M. Vignon has now attacked the fortress of our incredulity with a battery of scientific arguments and illustrations from art. He asserts that "the impressions are actual negatives," which "cannot be paintings" nor "have been produced by chemical transformation," and that "the shroud has retained the impression of a human body." He even claims to "show scientifically that the body did not remain enveloped in the shroud more than two or three days." His book deserves the attention—of the curious.

—Sir Wyke Bayliss's 'Likeness of Christ' originally appeared in folio, and included the work of his friend Thomas Heaphy (who died in 1873), in copies of early paintings found in France and Italy and of frescoes in the catacombs, with writings on the topic dear to them both. Sampson Low, Marston & Co. have brought out a "Library Edition, revised and enlarged," with the title 'Rex Regum: A Painter's Study of the Likeness of Christ, from the Time of the Apostles to the Present Day.' This likeness, Sir Wyke insists, has existed from the first century, "has never changed," and was by no means invented, but merely preserved, by the great painters of the Renascence and of modern times. As shown in forty illustrations, it is marked (with some variations, indeed) by long black or dark hair, moderate forehead, oval countenance, large dark eyes, long straight nose, mustache receding from the lip, short beard, and generally sombre expression. Those who limned the Master with golden locks must have been heretics, though Sir Wyke is too kind to say so; there is but one "likeness of Christ," and he believes it "must stand or fall with Christianity." The clergy, holding that it is the things which are unseen that are eternal, incline to lay less stress on any counterfeit presentment; but they are poor judges, for "to the artist the question is more direct and simple than to the theologian." In fact, " 'Rex Regum' is more than an argument for the authenticity of the Likeness of Christ—it is a Hymn to Christ." We must take the book, then, as a prolonged devout lyric, free from "the crotchets and quavers" of rhyme and metre.

—'The Principles of English Constitutional History,' by Lucy Dale (Longmans), is a manual of very considerable merit and one which it is a pleasure to praise. Its unusual feature is such an admixture of narrative as serves to explain the constitutional changes described. Too often the writer on constitutional subjects assumes that his undergraduate readers will be quite familiar with the course of current politics, but in a large majority of cases this assumption is quite unwarranted. Mrs. Dale gives us a sketch of English history from the 'Germania' to the Reform Bill, in which the growth of institutions is constantly associated with the progress of events. But while the element of pure narrative is much larger than it is wont to be in such works, the author's grasp of constitutional principles is by no means weakened thereby. One thing, however, we fail to understand. Mrs. Dale says in her preface: "This book, while presupposing a certain knowledge of what are commonly called the facts of English history, deals rather, as its title indicates, with the principles by the light of which alone these facts can really become intelligible." As we have already stated, the essential merit of the treatise seems to be its willingness to set forth environing circumstances where others have taken too much for granted. We can reconcile the passage quoted with our strongest impression only by suggesting that the phrase "a certain knowledge" is somewhat elastic. Mrs. Dale may have come across manuals which presuppose less knowledge of fact than her own, but we, at least, have not seen one. Some further idea of the design may be gathered from a brief statement regarding the arrangement of contents. The Saxon period is dismissed in a single chapter of thirty-two pages, and less than a third of the book has been traversed when we reach the death of Edward I. The central point comes at the accession of Henry VIII., thus giving the Middle Ages less prominence than they usually receive from the disciples of Stubbs. There is a good account of the Puritan Revolution, and the effect of modern conditions on the development of the political organism is also traced with admirable clearness. Our one adverse criticism is that the centuries which precede the Norman Conquest have been treated a little too rapidly. Yet even here there is ample room for difference of opinion. This is a sketch which students will like, and will be able to read with profit by themselves.

BROWNE'S LITERARY HISTORY OF PERSIA.

A Literary History of Persia from the Earliest Times until Firdawsi. By Edward G. Browne, M.A., M.B., Professor of Arabic in the University of Cambridge. (Library of Literary History.) London: Unwin; New York: Charles Scribner's Sons. 1902. Pp. xiv., 522.

Such a book as this must be received with peculiar pleasure. It is, in the first place, another sign of that renaissance in Oriental study which is evidently in progress in England, and in which we so unhappily are having small part. In time, perhaps, the American public will arrive at an

interest in the literature and history of the East for its own sake. At present, the religious and theological interests are supreme—whether for orthodoxy or for heresy—and no Orientalist can have a hearing, or a sale, until he drags his subject into some Biblical affiliation and catches the ear of the Sunday schools. In England, as was shown by the lamented E. J. W. Gibb's monumental 'History of Ottoman Poetry,' and is further shown by the present work, the case is different. The East is not simply the land of the Bible, or an expository annex to that land; it has meaning and value for itself. Again, this book is unique and refreshing in its point of approach to its subject. One of the most curious results of the theological origin of Oriental studies in Europe lies in the fact that the Arabist, in the rarest of cases, has been a Persianist; and that the Persianist, if possible more rarely, has been an Arabist. All the efforts of Fleischer and the German school, with its trivium of Arabic, Persian, and Turkish, have done little to bridge this gap. Persian has gone with Sanskrit; Arabic with Hebrew. In England, especially, students of Persian have been Indianists or Sanskritists; students of Arabic have been either theologians or closely affiliated to theology. Even William Wright, trained in the German schools and with no theological connections, when he went outside of Arabic went into Syriac. The sphere of Persian he freely abandoned to a Sanskritist like Cowell. But in Orientalism, all is topsy-turvydom, and Mr. Browne, the present author, whose professional training was that of a physician and who walked Guy's Hospital in his time, began his Oriental studies with Turkish, made his reputation as the best Persianist in England, and has now attained the official status of a Professor of Arabic.

His place is thus in the little band of men who have turned to the East because they heard it calling and could heed nothing else. Of these, in the last generation in England, was Edward Palmer, the greatest Arabic linguist of his time, who died for the empire at the hands of the Bedawin of Sinai. Such, too, is the present author, Palmer's nearest successor, though not to his chair, and laying his weight in a somewhat different field. As Palmer knew the Arabs, had nighted and dayed among them in the desert, and could play upon them with the magic of their own magical tongue, so Browne knows his Persians, knows them as no Indianist or Sanskritist could, probably as no other European does. He has lived with them and entered with sympathy into the (for us) grotesque fantasies of their religious thought, to him not fantastic or grotesque, but part of the universal cry to the Unknown. He has mastered their language—in this, too, like Palmer—in no mechanical way, but wields it easily with the skill of a Persian secretary. Whatever may be said hereafter by way of Arabic criticism, there can be no question of Mr. Browne's preëminence in knowledge of Persian and the Persians. Above all, he has come to them from the side of Islam, and thus his book, first of its kind, bridges for the West the artificial gap between Arabic and Persian, and shows the Persians, in history and in literature, as standing in the great circle of the Muslim peoples, and drawing a hardly intelligible stimulus and direction from their Arabic-speaking conquerors. That is, of course, the great puzzle of the history of Islam. The Persians, akin to the Greeks in race and language, were left unaffected by the conquests of Alexander and his successors, long as some of these endured, but were moulded permanently by the semi-barbarous hordes from Arabia, preaching, as they did, a doctrine which the Persians have transformed before accepting. But, puzzle or not, the fact stands fast, and it is that fact which is emphasized here.

This, then, is a literary history of Persia as a part of the Muslim world. Persian writings outside of the Persian race, as in India, it disregards; writings by Persians, though not in Persian, it receives. And the approach is on the side of Islam and Arabic, not that of supposed racial or linguistic affinities with India. It recognizes that the means of understanding that literature can be gained only through Arabic; that the student is tenfold better equipped if he have preliminary knowledge on that side rather than on the other, and that when the Persians for some three centuries after the conquest wrote in Arabic, it was still Persian, and living Persian, literature which they were producing. The present volume, therefore, consists frankly of prolegomena—absurdly lengthy, some may think, seeing that the history proper is to be summed in a volume of the same size; really essential, as all qualified know, to any intelligent knowledge which would go beyond belletristic trifling with Sa'di, Hafiz, and Umar Khayyam.

These prolegomena divide into four books. First, of origins, covering to the close of the Achæmenian period, and dealing with such matters as the beginnings and sources of the Persian races, their languages and scripts; the date of the Avesta, and its historical and geographical conditions; the discovery and interpretation of old Persian in cuneiform and in the Avesta; Hyde, Anquetil-Duperron, Grotefend, Burnouf, etc.; a description of the literature, in inscriptions, in the Avesta, in Pahlawi, and of the epic legends. The treatment of all this, though of necessity second-hand, is most excellent and full. Next comes—passing over that singular break stretching from the conquest of Alexander to the fall of the Parthians, B.C. 330-A.D. 226, so strangely fruitless of effects upon Iran—an equally luminous account, evidently more at first hand, from the rise of the Sasanians to the fall of the Umayyads. It covers the historical legends crystallized in the Shahnama and elsewhere, the conception of the divine right of the ruler which produced the great cleft in Islam, the origin of the Manichæans and the Mazdakeans to be thereafter so fruitful, the conquest of al-Yaman by Persia with its consequences, and the overwhelming and undreamt of *débâcle* of the Arab conquest. With this, Islam enters, and the conditions are laid for modern Persia. The Sasanians from henceforth are a vanished memory, and the "Kings of the Sons of Sasan" might as well, as in the 'Arabian Nights,' have lived in China. To understand Persia from this point, we must understand Islam; its threads now join with those of the history of Muslim thought. Here, then, a fresh start has to be made, and Muhammadan history—especially as to formative ideas—sketched in broad outline.

Book three depicts that golden century which formed the first of the Abbasid dynasty, in which the Iranian genius began to recover and came practically to rule, intellectually and politically, the Arab Khalifate. This was the result of the founding of Baghdad and the transfer of the seat of empire to within the Persian sphere. Before us moves the court of al-Ma'mun with its self-conscious "enlightenment"; the Mu'tazilite heresies develop and the orthodox theology forms, the Sufis pass from ascetics to mystics; Persian heresiarchs begin to spring from a fertile soil; above all, the great distinction of Sunnites and Shi'ites is fixed. The early Abbasids had deliberately played off the Persians against the Arabs, and this was their reward. But, so far, the empire had held politically together. The fourth book sketches the decline of the Abbasids which now followed, while the empire crumbled gradually, and it was no longer simply Persian thought which asserted itself, but Persian nationalism as well. Now rise the different families of Alids, the Isma'ilians, the Qarmatians and Fatimids, the Tahirids, Saffarids, Samanids, and Buwayhids. Persia has fully avenged itself. The history reaches to the times of Mahmud of Ghazna, who, though a most orthodox Muslim, gathered at his court a rich circle of poets, Persian now in tongue as well as in heart. This is a bare recital of names, but on Mr. Browne's pages there is a wealth of literary detail, almost too luxuriant for clearness; and the intellectual energy of the period, religious, philosophical, and mystical, fully lives before us. Last comes a short chapter on the literature of Persia in the specific sense, a bibliography, and a most elaborate triple-columned index of twenty-five pages. The second volume, to which this is but an introduction, will bring the literature from the circle of Mahmud of Ghazna to the present day.

A book such as this is, and still more will be, is epoch-making in its class. In no language does its like yet exist, and we shall probably have to look long enough for its successor. In manner and style it is a curious compound of old-fashioned England and modern Germany. It is full of a comfortable leisure; space is of little account, and details, picturesque, but not always exactly relevant, abound. MSS. are precisely described and located, with comments on the relative generosity of their holders; even abandoned theories find hospitable mention. Almost a page is given to the verses which Adam and the Devil are said, in Muslim tradition, to have made, in Syriac, against one another, and several pages to a sketch of the beginnings of Oriental study in Europe. Reading has made Mr. Browne a full man, and he wishes to give us it all. It is not to be wondered at that his publisher was hard to move to two volumes instead of one. Personal details too, are many. The late Professor Cowell is his "dear old teacher"; a page—well merited, but this was not the place—is given to the late Mr. Gibb; more than a page to Mr. Browne's own course of study. The discursive, chatty method which made his 'Year among the Persians' so valuable, here often becomes a burden. But these are truly details, and do not diminish the value of the book.

Other matters are somewhat more serious. Mr. Browne is one of the most accomplished Persianists alive, and on Per-

sian ground is absolutely at ease. In Arabic it is evidently different. His studies have required of him some knowledge of that language, and that knowledge has gone far enough for him to hold a chair technically of Arabic. But his Arabic, though good and exact, is not broad, and his access to authorities is not easy. The principal historical texts he, of course, uses, but he is evidently not familiar with the more recent investigations in Muslim philosophy and theology. Thus, his general dependence on Steiner for the Mu'tazilites is, at least, astonishing, and to quote Tholuck and Home on al-Ghazzali is to go back several generations. The sketchiness, indeed, of the treatment of so primary and formative a genius as al-Ghazzali is significant for Mr. Browne's philosophical studies in Arabic. Equally significant is his dependence on the laborious but not exactly brilliant or illuminating Dieterici, a man to whom certainly all honor is due as a pioneer. Significant, too, is the respect with which the opinions of Brockelmann are quoted, especially in one passage (p. 358) where that learned bibliographer is gravely bracketed with Goldziher, the greatest authority alive on Muslim literature and thought. On Sufiism, on the other hand, Mr. Browne is much more complete and exact, although even here he does not seem to have been in touch with the latest investigations. He recognizes its mingled ascetic and Platonic origin, but on the relationship of these two sources, as it has now been worked out, he is not very clear. At another point, his personal experiences with the Babis have been of much service, and he is prepared to believe that the Isma'ilians and other subterranean heretical sects may have been grossly slandered. There is certainly much, besides analogy, pointing in that direction, and the whole subject of the pursuit of intellectual and religious freedom and advance in Islam could well have been treated at greater length. This holds especially of the Zaydites.

Of direct slips there are few to note. Al-Junayd was much more orthodox than is represented on page 363; the Kitab al-bad' can no longer, as on page 310, be ascribed to an al-Balkhi; *rij'at*, same page, should be *raj'at; muluk at-tawa'if* (p. 79, etc.) is much more "Party Kings," *i. e.*, kings of small districts and petty dynasties, than "Tribal Kings"; *al-Fakhri* is the name of a book and not of its author; the statement (on p. 208) of the transfer of the khalifate from the last Abbasid to the Ottoman Turks is incorrect—it was transferred by inheritance, and not by gift, and the first Ottoman Khalifa was Sulayman the Great, not Selim I.; on page 367, al-Maturidi should be al-Mataridi.

Finally, mention must be made of the exceedingly happy translations which are scattered through the book. Mr. Browne has the knack of turning neat English verses, and is not burdened, like Mr. John Payne and his followers, by any unhappy theory as to the exact reproduction of Oriental metres. Such methods he explicitly rejects. In consequence, his verses have vitality and salt; they run easily upon the tongue and carry atmosphere with them. That they are often free is unavoidable. Oriental prose can be rendered literally; Oriental verse never.

A wholly admirable second volume may be confidently looked for; in it Mr. Browne will be on ground which he knows absolutely.

RECENT AMERICAN POETRY.

Professor Münsterberg of Harvard University, at a meeting of the Boston Authors' Club lately, is said to have met the assertion that all literature was tending toward the form of prose fiction, by the answer that Germany had already gone through that period, and was distinctly entering upon the dramatic form in the works of Sudermann and others. This time has certainly not yet arrived in our country, but any one who observes new books must notice the steady increase of published plays and tragedies, which are, or aim to be, within the domain of literature. Many instances might be cited. Among the more recent are "Maximilian: A Play in Five Acts," by Edgar Lee Masters (Boston: Badger); "Jonathan: A Tragedy," by Thomas Ewing, jr. (Funk & Wagnalls); "Ralegh in Guiana; Rosamond, and a Christmas Masque," by Barrett Wendell (Scribners). In the same way, Miss Anna Olcott Commelin gives us "Atala: An American Idyl" (Dutton), a poetic dramatization of the celebrated work of Chateaubriand. No one of these can claim positive dramatic merit, and only Professor Wendell's can be said to have literary merit; while even this, though by a highly cultivated man, is on the whole rather academic in character than otherwise. To these must, however, be added a volume of higher claims than either, containing three dramas—"Pontius Pilate, Saint Ronan of Brittany, and Théophile: Three Plays in Verse," by Henry Copley Greene (Scott-Thaw Company). Of these dramas, the first two seem a little experimental, as if the author were not quite sure of his ground; but the third, from beginning to end, shows grasp, power, dramatic beauty, and the mediæval spirit; and withal it has stood admirably the test of actual performance, at least by amateurs. Under these last conditions, it may truly be said to have given as effectually a new sensation to all who beheld it as was produced by the Morality Play of the Elizabethan Company which has recently been among us. Mr. Greene's play is happily illustrated in this volume by a frontispiece by Cecilia Beaux, who has thrown into her figures in its full force the intense power of the original conceptions. The appearance of this drama alone would be enough to prove that in America, as in Germany, the exclusive reign of prose fiction is past.

It is always difficult for foreigners to comprehend how easily the literary habit in America, like all other habits, may be simply one manifestation of the overflow of versatile minds. Mr. T. S. Denison, a well-known Chicago publisher, has personally produced thirty-six plays, all of which must have been acted, for his list of them gives precisely the number of minutes occupied by each. Of these plays collectively, nearly half a million have been sold. He has also written and published two novels, each of which has reached a fourth edition, and now issues a volume of poems called 'The Old Schoolhouse, and Other Poems and Conceits in Verse.' Of these he says in his preface:

"They are part of the bric-à-brac accumulated in my intellectual workshop during twenty-five years. Not knowing what else to do with them, I cast them forth on the sea of print as a mother bird casts her fledglings from the nest. Some of them, like 'Hasten, Love, Hasten,' are poetry; others, like 'The Ibis,' merely rhymes. If I were to indulge any regret concerning their publication, it would be that not more of them are poetry."

This last regret is one which critics may generally be relied upon to share, and in no way can an author do more favor than to indicate which of his works best fulfils his own standard of excellence. We hasten, therefore, to give a verse selected by himself in Mr. Denison's circular, and presumably his most approved (p. 59):

"I've built thee a bower 'mid roses and vines,
Where each fragrant hour to love lore inclines;
The south wind is blowing, the rose is aglow;
Oh, hasten, love, hasten, thy coming is slow."

It is certain that this can scarcely be criticised as placing the author's standard of execution unreasonably high.

A poet seldom risks more than when he selects from his volumes the technically sacred poems, and prints them separately. The rhymes of faith which add greatly to the effect of a miscellaneous volume, are apt to seem weak and monotonous when put off by themselves. This ground for criticism we find in Mr. Louis Alexander Robertson's 'Cloistral Strains' (San Francisco: Robertson)—a little volume which seems to need, if the phrase be not thought self-contradictory, his previous poem of the "Dead Calypso" to give it life. Or perhaps another new volume by him, 'Beyond the Requiems, and Other Verses' (same publisher), is relied upon to restore the balance. At any rate, a single poem of this last work, called "A Rhyme of the Redeemed" (p. 30), vindicates the essential tone of this author; and the modesty of his prelude to the volume vindicates the whole of it. It is thus (p. 9):

THE SHRINE OF SONG.

In mute amazement oft I pause before
The portals of Song's shrine, and list to those
Whose music from its classic cloisters flows
Adown the tide of Time for evermore.
I see the place that no man may explore,
Save him whose Art its life to Genius owes,
On whose rapt lips the sacred cinder glows
That teaches Song's sweet shibboleth and lore.

Ah, it were heaven to enter in and kneel
In some dim aisle, unnoticed and apart,
With thirsting soul to drink the sounds that shame
My songs to silence; then to rise and feel
That my untutored lips had learnt the art
That seats the singer in the House of Fame!

Perhaps no American poet puzzles a conscientious and kindly critic more than the Rev. James Vila Blake of Chicago, who prints in that city and publishes in Boston a volume, called simply 'Sonnets,' which includes no less than 150 of such productions, whereas even Shakspere was content with 154, and might well have spared a dozen or so of those. Not content with this, the Chicago poet offers fifty-one "Cameos" of nine lines each, and ends with four pages of notes, giving the names of thirty-four different ladies to whom individual poems are dedicated. He tells one of these ladies that the "courage of conviction, of thought, and of choice of a church, is no small valor," which looks as if this lady might be his latest convert. All this as a bit of autobiography may be suitable enough, and Mr. Blake can write simply and wisely like this (Cameo XX.):

My simple verse, I do admire
Your harmonies, your gentle fire
Of happiness, your love entire.
Ye make a chambered glow for me
In which I walk about with you:
So I am never out of view

Of Light, though dark around it be.
Ye spare me tumult and desire,
And mad flame of ambition dire.

But how unlike is the simplicity of these lines to the feebly fantastic qualities of a sonnet like this (lxxxvi.):

Juno, Olympian Queen, to Iris, said,
"Dispatch ye now the circling world to scan;
Find me three maids so cold and nunnery-bred
Their bosoms have not brooked one thought of man."
Down on his opal wings of changing hue
Dropped Iris; but he sought the maids in vain,
All corners rummaging; then up he flew
And stood before the spouse of Jove again.
"What! Not found one?" quoth Juno with knit brow.
"Have patience, Queen of Heaven, I heard of three;
But Pluto seized them first and has them now."
"What! Pluto? Pluto hunting prudes?" quoth she;
"And pray for what? Are they Tartarean houris?"
"He wished them, Madam," Iris said, "for furies."

Of the two new volumes before us by Mr. Madison Cawein, 'Kentucky Poems' (Dutton) and 'A Voice on the Wind, and Other Poems' (Louisville: Morton), the one has an introduction by Mr. Edmund Gosse, and the other has in turn a dedication to him. Whether this is to be the alternation in future of Mr. Cawein's always profuse volumes, is yet to be seen. Mr. Gosse's introduction begins by speaking of "that graceful and somewhat academic school of poets who ruled American literature so long from the shores of Massachusetts." It would be difficult, perhaps, to reason seriously with the critic who can find nothing but "grace" in Emerson and nothing that is not "academic" in Whittier. Then he goes on, after the practice of the secondary class of English journalists, to reproach America for liking what he calls humorous verse, "which is mainly in fashion on the western side of the Atlantic." He finds it convenient to overlook the fact that it is not in America, but in England, that such verse, however readily it may be produced here, comes to the dignity of being "in fashion." Every American, when he goes to England, hears jokers and doggerel-makers quoted of whom he never heard at home, just as he is offered so-called American drinks whose names were never known in this country. Mr. Gosse further complains that "this is not a moment when serious poetry, of any species, is flourishing in the United States," and ignores the fact that he himself has had to spend most of the last dozen years in importing it from other countries even into England. He is simply quarrelling with that ebb and flow of the tides for which the only remedy is patience and good sense.

As a matter of fact, all that American criticism has ever done in respect to Mr. Cawein has been to urge upon him, in spite of the compliments always paid him by Mr. Howells, a little more moderation of epithet and a little more patience in execution, as he approaches maturity of years. When one compares, for instance, the admiration with which Mr. Lanier's poems, in spite of their exuberance, have been recived by American critics, it must be owned that they are not wholly unreasonable in imploring Mr. Cawein—who is, if we mistake not, drawing near the age at which Lanier died—to show something of that capacity for growth which marked his more highly gifted predecessor. It is fair to claim that their remonstrances have not been wholly unavailing, and that he is now at last beginning to exhibit what even Mr. Howells guardedly calls "his increasing control of his affluent imagery," and may in time outlive his more ardent admirers and do something worth preserving. We honestly wish it might be so, for we never open one of his books without admiration for his minute study of nature, commonly spoiled in its rendering, at least up to this time, by an immense exuberance of adjectives. The following poem, from 'A Voice on the Wind,' gives him at his best (p. 63):

THE END OF SUMMER.

Pods are the poppies, and slim spires of pods
The hollyhocks; the balsam's pearly bredes
Of rose-stained snow are little sacs of seeds
Collapsing at a touch; the lote, that sods
The pond with green, has changed its flowers to rods
And discs of vesicles; and all the weeds,
Around the sleepy water and its reeds,
Are one white smoke of seeded silk that nods.
Summer is dead, ay me! sweet Summer's dead!
The sunset clouds have built her funeral pyre,
Through which, e'en now, runs subterranean fire:
While from the East, as from a garden bed,
Mist-vined, the Dusk lifts her broad moon, like some
Great golden melon—saying, "Fall has come."

We have hitherto had occasion to find promise in the earlier productions of Mr. George Cabot Lodge, whose volume of 'Poems' (Cameron, Blake & Co.) is now before us; but we regret to find that this author, although thirty years old and eight years out of college, still lingers in the sophomoric period. There are dashes of serious thought and of poetic expression, and there is certainly quite enough in the way of semi-turbulent passion, half sense and half sentiment; but we find no signs of condensed power or the brevity that deep feeling gives. He still seeks new and yet inexpressive epithets—"the chuckling tide" (p. 40), "desirous tears" (p. 55), "the wondering-up of love" (p. 83). It is to be feared that we must look to some high purpose or deep and genuine grief to bring him to maturity. These verses are a favorable selection, yet note the turgid phrases, the cheap alliterations (p. 54):

ODE TO THE SEA.

Lure me, O musical motions of the sea,
Thou of the cosmic heart most mighty mood!
And breathe beside me once again, O ye
Intimate whispers of the outlawed wind!
And grant, O Earth of long maternity,
While dawn grows golden like an infant God
Who walks the young world's twilight nude and free,
Thy latest child the rest he cannot find!

Still as I sought thee soul and flesh were fain!
Before the flower of sunset, one by one,
Scattered its petals like a golden rain,
Before the twilight clear as amethyst
Covered my lidless eyes, within my brain
Seemed, in the lasting silence of the sun,
All life as interludes of uttered pain
That scar the lips of Heaven's mute Agonist!

I am the heir to Time's exceeding dower:
Ease me, thou minstrel of the changeless theme!
Now while the midnight yields the mystic flower
Of moondawn, violent as a sanguine stain,
Like love's desire that in night's loneliest hour
Dawns thro' the empty twilight of a dream,
Mend with thy music-threads of faith and power
Life's raiment ruinous with surmise and pain!

A beautifully printed book from Updike's Merrymount Press, Boston, and published by the Pafraets Book Company, Troy, N. Y., is a collection of versions from a great variety of languages, including the Oriental, under the title of 'Flowers of Song from Many Lands,' translated by Frederic Rowland Marvin. Such great variety itself rather tends to scatter attention than to command it, and we find no striking evidence of ability in use of language on the part of the translator. Nothing in this handsome volume interests us so much, on the whole, as the little collection of Sun-Dial Mottoes from Southern Europe, such as these (p. 137):

Afflictis lentae, celeres gaudentibus horae.
Motto on a Sun-dial at Courmayeur in the Valley of Aosta.

Felicibus brevis, miseris hora longa.
Motto on a Sun-dial at Martigny.

Maestis lentae, celeres gaudentibus horae.
Motto on a Sun-dial near Padua.

Mr. Rossiter Johnson, who has always been in literature a faithful and high-minded but not always inspired workman, is, in his 'Morning Lights and Evening Shadows' (The Marion Press), perhaps, at his best in the very shortest of his poems, which yet has in it wisdom enough for a dozen (p. 108):

GREAT AND SMALL.

Our lives are little, but our times are great.
We come, we see, we linger, and we pass;
Weave but a single thread in web of state,
Or give the field a single spear of grass.
We are too often like a boyish class,
Where each one stumbles through his dozen lines,
And looks bewildered at the stubborn mass
Of foreign words and intricate designs,—
But lo! when all is done, through all an Iliad shines.

Miss Edith M. Thomas, so long a resident of Ohio, but now of New York, has suffered a little of that loss so apt to come to those drawn by powerful attraction to the metropolis; or else she is one of the many in whom genius is powerfully enough developed to command attention, but not quite sufficiently so to hold it. In her volume, 'The Dancers, and Other Legends and Lyrics' (Boston: Badger), her two final poems, "The Mistakes of a Day" and "Shield Me, Dark Nurse," betray perhaps some consciousness of this; and one turns to the graceful verses "Is It Spring Again in Ohio?" for a little relief from the sadder strain. The poem which, however, to our thinking, shows most of the author's old power, is one whose mere title is a song by itself (p. 35):

THE WOLVES OF THE WIND—A BURDEN OF THE SEASON.

Bare are my walls, and low is my roof,
Yet, heaven be praised! they are winter-proof!
Hark, how the wolves of the wind rush by!
(Was the sound I heard a human cry?)

The fire on my hearth is blazing bright,
Within is cheer, without is the Night
Blanching with fear from earth to sky—
Hark, how the wolves of the wind rush by!

They are swift, they are fell, and they never tire,
But they shun the light of my blazing fire,
So blest is my portion, so safe am I.
(Was the sound I heard a human cry?)

They have broken the leash that held them back,
And the whole world dreads the fierce, wild pack!
To shelter, to shelter, let all things fly—
Hark, how the wolves of the wind rush by!

Matters not where, the heath, or the town,
Whatever they meet they're trampling down:
And the veins of the victim they're draining dry!
(Was the sound I heard a human cry?)

The sound, too plain it rises again,
The myriad wailing of outcast men:
In the path of the pack they stricken lie—
Hark, how the wolves of the wind rush by!

'North Flowers: A Few Poems, by Wendell Phillips Stafford' (St. Johnsbury, Vt.), truly describes itself; the product is but scanty. The author, not unknown to readers of the *Atlantic* and the *Green Bag*, now elevated to the Supreme Bench of his native State, perhaps would signify by this volume the close of his poetic diversion. Hence a greater inclusion than if his muse looked forward confidently to fresh inspiration and activity. There is much here that is singable; more, of better quality and deep feeling, expressive of affection for home and kindred. The division "Pastime" exhibits some charming and some effective legal humor, and good epigrams are not wanting. It is, however, in elegiac verse that Judge Stafford reaches his true level—in the memorial tribute to his great namesake, and in the stanzas on "The Republic," evoked by the Chicago Exposition. It is hard to choose between these lofty and admirably sustained poems, but

we will quote from the latter as less well known:

"Her hands are clasped across her knees,
Around her rise the hymns of peace;
She hears them not—upon her ears
The storms of battle swell and cease.

"The saviours of her doubtful day
Are with her in her dreams, and they
That lacked the sinews, not the will,
To wrench her sceptre-staff away.

"(Slowly her strength the Titan learns,
Dimly her dawning fate discerns;
She was conceived in strife, and still
The birthmark on her forehead burns.)

. . . . . .

"She hears, and smiles in slow surprise;
Her limbs to awful stature rise;
The sunlight trembles in her hair,
And all the future fills her eyes."

CLASSIC ARCHITECTURE.

The Orders of Architecture—Greek, Roman, and Italian: A Selection of Examples from Normand's "Parallel" and Other Authorities, with Notes on the Origin and Development of the Classic Orders, and Descriptions of the Plates. By R. Phené Spiers. Fourth Edition, revised and enlarged. London: B. T. Batsford; New York: Charles Scribner's Sons.

The Architecture of Greece and Rome: A Sketch of its Historic Development. By the late William J. Anderson and R. Phené Spiers. 179 illustrations. London: Batsford; New York: Charles Scribner's Sons. Pp. xvii., 300.

Mr. Spiers is very widely known among all who use English books on architecture, because of his labors in reissuing, with important additions and notable changes, Fergusson's 'History of Architecture,' John Murray's edition of 1893. Of this work the two volumes which are much the most widely known, and which constitute the 'History of Ancient and Mediæval Architecture,' were indeed so recast by Mr. Spiers that Fergusson would not have known them. The editor's services in contributing a new chapter on Byzantine art, and in making the changes, often very much needed, in the assertions of the original book concerning Classical, Assyrian, and Judaic architecture, are all of incalculable value. He is known, moreover, as the director of the Architectural School of the Royal Academy and as extremely active in the matters of the Architectural Association of London and the Royal Institute of British Architects. That work of his which is most accessible to Americans is contained in his articles contributed to the 'Dictionary of Architecture and Building,' extremely thorough and minute. In the preparation of an exhaustive book on the Grecian and Græco-Roman orders the work of no writer would be more welcome than his. The subject has not been treated yet in a completely satisfactory way. If then the orders of the Renaissance and Post-Renaissance periods are also to be studied in connection with those of antiquity, there is much waiting to be done. The first book before us seems to undertake this comparison, as well as comparative treatment of different examples of each order; but it is not so complete a work as that which we have imagined.

Speaking, then, of what it is: there are twenty-six plates, of which one gives profiles of a number of Greek capitals and mouldings, and two give drawings of ornament, the one of Greek, the other of Roman examples—drawings in outline only, and often not refined in the handling, therefore, leaving in doubt the exact curvature of scrolls and sprays; nor of very complete rendering. Indeed, they frequently leave doubtful the question whether the ornament shown is in high or low relief, or with parts of it relieved much more than others. There is one plate containing an interesting comparison of the Greek Doric order, the Roman Doric, the Greek Ionic and the Roman Corinthian orders, but it may be misleading to the beginner to see them all uniform in actual height, thus making the Grecian Doric look much the most massive on account of its proportions, and ignoring the fact that the Roman Corinthian was frequently carried out on a much larger scale. In like manner, the student is vexed with the displaying of three Ionic examples in Plate VI. and five Doric examples in Plate II., with continually varying scales. It would surely be worth some effort to show (Plate VI.), by actual comparison of the three buildings side by side, that the temple on the Ilissus in Athens is a little thing with columns much less than half as great in their lower diameter as in the temple of Minerva Polias at Priene. The scales are there, to be sure—the thirty feet of the Priene scale equivalent to only ten feet in the Athens scale; but one of the important things to insist upon in these matters is the curious fact that Græco-Roman architecture almost invariably followed its proportions boldly without attempt at modification in consequence of size, the absolutely inevitable narrower spacing of the columns being almost the only distinction made between the gigantic Temple of the Sun and a little temple like the smallest of those at Pæstum. So, in Plate IV., the Doric order of the Theatre of Marcellus is taken from Normand, and nothing is suggested of the alleged recent discovery of a base to these columns, the more to be regretted as it has always been a surprise to students that that building should have been built as it was supposed to have been built, without bases.

The text is full of interest, and relates to the origin and development of the classical orders in the way that we have said is so much needed; but it seems not to have been treated carefully. Revision would have suggested to the author that, if the corner columns in a Doric temple are nearer to their next neighbors than the other columns are one to another, there is reason for this besides the desire of making the metopes square. It is of doubtful propriety to speak of the mutules as "slabs" when they are merely in slight relief from the surface of the large block of stone and are not separate pieces. The famous acroterium disk of the Hera temple at Olympia is not "semi-circular," because, as truly stated in the next line, its soffit or lower bed corresponds to the double slope of the raking cornice above the pediment. What can be meant by the saying (page 4) that the rules spoken of as invariable, *e. g.*, that the angle column is set closer to make the metope square, as above stated, has some "exceptions which prove the rule"? The exceptions are named, and in those the metopes nearest the corner are not square; but does that or any other exception "prove the rule"?

It was quite time that a book should appear, giving a popular and also trustworthy account of the architecture which is most near, in respect and in sympathy, to our modern communities. And it was desirable that such a book should have but little strongly held theory—should have but little to prove. There is interest enough in the clear statement of those long-held beliefs and those discoveries of recent times upon which all scholars are agreed; there is novelty enough in the setting forth of those revised and more exact views of the great arts of antiquity, without the urging of any opinion, or even of any conjecture, for which argument or elaborate demonstration would be needed. Such a book is the second whose title is given at the head of this article; and it is important to the beginner in this study that there is here no attempt to urge unduly either the theory now much held that Græco-Roman art is one, and to be treated as one, or the contrary theory that the building of the imperial times was faulty and tasteless in that its chief architectural decoration was a contradiction of the real structure, and that it is in this way far enough from being a natural evolution of the art of Greece. Each of these theories is tenable for awhile; and the question which of them shall prevail in the mind of any one student is very much a question of temperament. On all accounts, then, it is well that it should not be raised while one pursues his preliminary inquiry; and in like manner it is best not to spend too much time over the tempting, because insoluble, mystery—whence came the solid mortar-masonry of the Roman engineers? Now the present work, while suggesting the existence of this and other such questions, does not insist upon them. Chapter i. deals with the Mycenæan age; chapters ii. and iii. with the archaic period; chapter iv. with "The Culmination in Athens"; chapters v., vi., and vii. with further considerations and with the later work of Greece. Of the matter so presented, about half is announced as the work of William Anderson, who died some four years ago. There is then a chapter on Etruscan building, and thereafter, occupying just one-half the volume and six chapters, follows the account of Roman work, given with but little historical sequence, and with almost a wholly analytical treatment. There is a brief glossary of terms, a list of selected books relating to the subject in hand, and an index occupying twelve pages.

The illustrations to the book are in part photographic prints; and, for some of the inserted plates, care has been taken to point out separate buildings or details by means of reference letters or separate printed indications at head and foot. About half of the illustrations are line-cuts scattered through the text. If the general subject of all the pictures be considered, it appears that there are very many useful plans, some of them quite inaccessible to the public, like those (pp. 91, 93) of the Artemis Temple at Ephesus, as restored by Dr. A. S. Murray, or like the very large plan of the buildings on the Palatine Hill as inferred and imagined by Mr. Deglane, and the more trustworthy plan of the Forum at Rome by A. F. V. Dutert. Views taken by the camera are naturally less available in an inquiry directed in the main toward dismantled or wholly ruined buildings; but there are still interesting pictures of Roman work, as of the memorial arches, and of many details of sculpture,

as also of rooms in the house of Vettius at Pompeii.

As to the general value of the work, it is perhaps to be pronounced that of one full of knowledge, but not carefully prepared nor put into perfect shape. The importance of the book is in that part of it which belongs to Mr. Spiers—so much is evident enough; but this work seems to have been done in the easy manner and with that indifference to form not unnatural to a scholar well versed in the subject, and well decided to do the immediate work of composition in the most prompt and familiar way. No pains have been taken to avoid repetition; little success has been reached in the ordering of the subject; the scraps of historical record which are scattered through the text do not come in apropos; the work is, in short, a somewhat inadequate result of the use of excellent and ample materials. In the present condition of our libraries, devoid of a satisfactory book containing the latest discoveries and the latest conclusions of those who have made a special study of classical art, this one is essential to every student; but it is greatly to be desired that it should be put into more agreeable and especially more convincing form. More directness of statement; more consideration, as one part of the subject is unrolled, of that which has been said of other parts of the same subject—were these things secured, the book would be one not easy to supersede.

Fishing and Shooting. By Sidney Buxton, M. P. With illustrations by Archibald Thorburn and from prints. E. P. Dutton & Co. 1903.

We have here a volume primarily for the entertainment of the sportsman, not for his instruction. Mr. Buxton leaves the would-be sportsman to learn how to use his rod or gun elsewhere, so far as technical instruction is concerned. We find no rules for fly casting, with the regulation cuts of the angler in various impossible attitudes at the different stages of his cast; no chapter on amateur fly tying, with endless lists of White Millers, Jock Scotts, Brown Hackles, Seth Greens, Silver Doctors, Yellow Sallys, etc.; no scientific demonstration of the superiority of a Sproat or a Limerick over a Kirby or Carlisle. This kind reserve bespeaks the reader's gratitude. One does not learn to angle in that way, and such discussions are not particularly interesting simply as literature. As to gunning, Mr. Buxton does essay a few pages of formulated advice, but the note of jocular insincerity which one soon detects in the advice itself is confirmed by the immediately following injunction to "chuck it away out of the window, clear your mind and brain of all rules, and shoot as seems best to you."

It must be said that our author rides overhard the hobby of "dry-fly fishing." Angling has always been a prey to hobbies. It has its fads of individual anglers, its fads of groups, its fads of locality, and its fads of times and seasons. One does well to listen with reserve to any adviser who cannot see the sport out from under the shadow of some one or more of these fads. Mr. Buxton also presses unduly the method of "fishing *at* a fish" which you have previously located and "stalked," as against that of "fishing *for* a fish," which may be somewhere near the spot where you drop your fly, and again may not. Every man to his own taste, but the acme of enjoyment in the streams and woods is to the eclectic, not to the rigid adherent of a method.

We are sorry to say that the book shows traces of weakness as to the ethics of sport. Excessive slaughter is condemned in words, but at the same time Mr. Buxton boasts once and again of a single day's record in his own experience of fifty trout, each weighing over one pound, "besides many others under a pound." If an angler of the highest type, in a moment of weakness, should be led by unlooked-for success into making such a haul, he would seek to hide the fact from others rather than to publish it. Again, Mr. Buxton is rather inclined to apologize for his best day at pike fishing, landing only thirteen, "the three largest being fourteen pounds, twelve pounds, and ten pounds, respectively." Commend us rather to the American angler who crossed a large portion of the continent for the experience of landing a tuna, and, after securing one fine specimen, his first strike, took his rod apart and went ashore while the fish were still actively feeding.

In shooting, too, Mr. Buxton greatly prefers "the blessed system of driving," which we can hardly allow to be the highest ideal of healthful and manly sport. It is one thing to take a pair of guns, with a hired assistant to carry and load them for you, ensconce yourself in a fixed position, "cartridges and paraphernalia conveniently disposed, sods altered, foothold trodden level," and then wait for the birds to be beaten up and sent flying over the guns by still other hired assistants: it is quite another thing to shoulder your gun some autumn morning and spend a fine day in tramping over the fields and woodlands—happy in any case, and only more so if the game-bag come back not entirely empty. If the latter be not considered the better, so much the worse for the man behind the gun.

We are told, to be sure, that the rough day in the west of Scotland is the most delightful of all, but the genuineness of the sentiment is ill supported by the general tenor of the volume. Perhaps the author's temperament, whatever his theory may be, does not incline him to methods which require too much physical activity. The illustrations with which he has chosen to adorn his book are on the whole rather suggestive of what some would call "kid-glove" sportsmanship. One would like to guide him along the trail of some nameless little trout brook through the mazes of a Michigan cedar swamp, where the best holes are sometimes to be reached only by perching yourself upon the slippery trunk of a fallen tree ten feet or more above the water, or by tearing your way through pathless acres of prickly raspberry bushes, often higher than your head, too dense for the ground to be seen, and concealing every few feet some fallen log, woodchuck hole, or other trap for the unwary.

Mr. Buxton has an undisguised preference for the rod over the gun. He is perhaps not far from right when he attributes the zest for shooting largely to "the aboriginal killing instinct." There can be no question that the amount of suffering produced by the gun is many times greater than that for which the rod is responsible. The wounded bird or animal very frequently escapes in such condition as to insure a lingering and painful death, while the fish so hooked as to permit escape is but rarely injured to any fatal or seriously painful degree. Many an angler has had the same indubitable evidence which Mr. Buxton cites, that a fish may break off one hook in his mouth, go to feeding again immediately, and within a few minutes be taken upon another. If the broken hook were seriously painful, the fish would, of course, cease feeding for the time. Such cases are also pretty good evidence that the sense of extreme fright which it is generally assumed that the fish experiences on being hooked, is somewhat overestimated.

In its literary quality, Mr. Buxton's book is somewhat uneven. There are fragments of description in it which are finely done, and in general he can put his thoughts in a straightforward and effective way; yet he is capable of saying "A heavy up-stream gusty or cross-stream wind tells against accuracy of casting, and are better away." Again, we are told of a bird which "falls, twisting round and round, shot through the brain, into the rhododendrons." We should like to see a score of average school children asked to hazard a definition of the word *rhododendrons* on the basis of that sentence. It reminds one of Thoreau's "natural pasture for the moose and deer, exceedingly wild and desolate, with occasional strips of timber crossing them." Externally, the light weight of the volume, in proportion to bulk, makes it easy to handle, and the green buckram binding, with appropriate gilt designs of natural and artificial flies, game birds, trout, etc., is pleasant to the eye. The text is clearly and attractively printed, and typographical errors have been almost wholly eliminated; "sense" for tense, on page 109, being the only such error we have noted. On the whole, Mr. Buxton has written a readable volume, fairly representative, no doubt, of the British sportsman, but with none of that delightful seasoning which one finds in such books as 'Fisherman's Luck' or 'Little Rivers.'

Gardens Old and New: The Country House and its Garden Environment. Vol. II. London: Newnes; New York: Charles Scribner's Sons. 1902. Pp. xii., 284.

About a year ago we printed a notice of the first volume of this admirably illustrated work. A second volume is now at hand, and indeed, considering their origin, there is no reason why volume should not succeed volume annually as long as that entertaining English weekly, *Country Life*, continues its present course. The chief article of that paper is usually devoted to a country house and its gardens. A profusion of excellent photographs, reproduced with the utmost skill by the half-tone process, characterizes these articles. From the wealth of material thus accumulated, it is no difficult task to select a series of views representing in delightful fashion the garden art of the land where that art reaches its most interesting development—where, though its form is less stately than in Italy and less grandiose than in France, it nevertheless has a personal and intimate charm lacking in other lands. To have placed before us, week by week and year by year,

all that is best of this art, whether it be new or old, is a privilege of which Americans in increasing numbers avail themselves; but the finding of an article on a given garden among the old issues of a weekly magazine is no light task, and therefore the gardens are doubly welcome when bound by themselves and separated from race horses, society dames, and automobiles, the photographs of which accompany them in the original publication.

The present volume, though particularly rich in ancient houses and gardens, is not without excellent examples of very recent work in both. Munstead Wood, near Godalming, the residence of Miss Gertrude Jekyll, shows the combination of her own skill as a garden artist with that of Mr. Lutyens, the architect of her house. The garden has a natural character, containing some features of stone work consonant with the architecture, but the whole is dependent for its greatest charm upon the skilful and abundant use of hardy plants. This garden, which for the larger part existed before the house, is familiar to the readers of Miss Jekyll's books. In it she has put into execution her ideas of good gardening, and from it she has learned the many lessons that she in turn offers so freely to her readers.

Among old houses none can exceed in picturesqueness Compton Wynyates in Warwickshire. But it is not alone the irregular, towering, castellated masses of the house which give to Compton Wynyates its unique charm. The gardens in loveliness, in radiance, in appropriateness, form so excellent a setting to the old mansion that one is constrained to yield them a large share of his admiration. About the old moat extend great masses of those tall, hardy flowers that give the note of distinction to much of our modern gardening. There is little formalism in the arrangement, but a few hedges and solemn yews serve to unite the old garden with the new. Peace and repose invest the ancient abode as it lies in its wood-encircled cup.

To speak of even a tithe of the stately mansions which this book presents would lead us beyond our limits. Suffice it to say that the standard of the earlier volume is maintained in all ways, and, surprising as it may seem, the wealth of gardens of the highest interest seems as yet to show not the slightest sign of exhaustion.

Mutual Aid: A Factor of Evolution. By P. Kropotkin. McClure, Phillips & Co. 1902.

Two aspects of animal life have so impressed Prince Kropotkin as to lead him to offer this criticism of the Darwinian theory of natural selection. While journeying in Siberia, he observed that the struggle for existence against inclement nature was very severe; but he observed also that, among animals belonging to the same species, there was no such bitter struggle as the followers of Darwin considered to be the main factor in evolution. On the contrary, he saw that mutual aid and mutual support constituted a feature of the greatest importance for the maintenance of life, the preservation of each species, and its further evolution.

Other observers, it is true, have remarked the existence of love, sympathy, and self-sacrifice among animals, but it seems there is a feeling wider than this: the consciousness, among men, of human solidarity, to which the social instinct among other animals corresponds. Darwin indeed pointed out how, in numberless animal societies, the struggle between separate individuals for the means of existence disappears; how *struggle* is replaced by *co-operation.* He asserted positively that "those communities which included the greatest number of the most sympathetic members would flourish best, and rear the greatest number of offspring." But this view was obscured by Darwin's devotion to the gathering of evidence illustrating the consequences of a real competition for life, while Huxley and others, bettering their master, represented the animal world as on about the same level as a gladiator's show: "the spectator has no need to turn his thumb down, as no quarter is given."

Some allowance must be made for the ferocity of Huxley's dialectic, and no one seriously denies that in families, and even in larger communities of the same species, mutual aid is essential to life. But the earlier social unions of men seem to have been formed for defence and for attack—in short, to oppose and even to exterminate members of the species outside of these unions. Nor does it admit of denial that, even within a community, there will be strife where food is insufficient; if some must starve, it will generally be the weaker rather than the stronger. No doubt there are exceptions, and the author makes the most of them, but he is reduced in the end to the bald assertion that those who survive a famine or an epidemic are neither the strongest, nor the healthiest, nor the most intelligent. This appears to us both untrue and irrelevant.

The custom prevailing among certain savage tribes of killing old and decrepit members is explained as an amiable compliance with the generous anxiety of these cumberers of the earth to relieve the community of the burden of their support. This explanation does not fit the case of infanticide; but we are told that great reluctance to resort to this practice is often displayed. This may be conceded, but it also is irrelevant. In fact, we cannot consider the reasoning in the book as meeting the demands of a scientific presentation of evolutionary theory. Nevertheless, the facts collected are very well stated and make interesting reading. Comparatively little is told of mutual aid among the lower animals, but coöperation among savages is fully illustrated, and the mediæval guilds and modern trade and labor unions receive ample notice. It may at least be said that this aspect of human evolution deserves the recognition which it here receives, as contrasting agreeably with the harsher features of competition.

The Harmonics of Aristoxenus. Edited by Henry S. Macran. Oxford: Clarendon Press; New York: Henry Frowde. 1902.

This book contains, beside the text of Aristoxenus, an introduction, an English translation, notes, and an index. The text shows careful editing, and the notes are scholarlike, in spite of an unfortunate bias against Marquard and Westphal, to whom our editor is sometimes positively disrespectful. The translation is pleasant to read; but it is, now and then, more properly a paraphrase. This, in the case of mere literature, is often preferable to a translation; but it is dangerous in dealing with scientific works, because a paraphrase is necessarily affected by every bias of the paraphrast.

The most important part of Mr. Macran's work is the introduction. What makes it so is that, after all that has been theorized concerning the modes in Greek music, Mr. Macran has still found it possible to evolve an entirely new and extremely ingenious theory. Our readers who have had the patience to follow us in some earlier reviews of recent English books on Greek music, will remember that one of the chief points at issue has been whether the modes differed merely in pitch, or in the size and position of the intervals in the scale. Mr. Macran has hit upon a new basis of classification. Instead of the relations of intervals in the original tetrachord scale, he takes for his basis the heptachord scale and the way in which the tetrachords are combined to produce it—namely, by conjunction, in which the last note of the first tetrachord is also the first of the next; by disjunction, where this is not the case; or by a combination of the two plans. These three methods distinguish, in his view, the three most ancient modes, Iasti, Doristi, and Aiolisti.

The idea is novel and striking. Its chief support is found in a passage of Pollux, in which these three modes are named as the original ones. Only, the passage seems to prove too much; since, if this theory were accepted, it should seem that there never could have been more than three modes.

The interpretation of the three passages cited in support of the editor's view is colored by his *à priori* view of the origin of modes. He accordingly fails to see that Athenæus (xiv., 624, c) cites the opinion of Heraclides Ponticus as something quite excentric and arbitrary; that Aristides Quintilianus is speaking merely of the enharmonic genus; and that the passage from the 'Isagoge' refers to keys and not to modes. We cannot ask our readers to follow us in a discussion of these points; but to us it seems improbable that, at the very early period to which belongs the distinction of these modes, musical theory had gone as far as this subtle analysis implies. And again, if these three names of modes refer to the combination of tetrachords into larger scales, is it credible that the earlier tetrachord scales of the four-stringed lyre had never been distinguished? We have abundant testimony that there were various ways of tuning the four strings, and that these were recognized as different "systemata." It is not credible that these different methods were left unnamed. Nor does it seem probable that the later scales of seven or eight notes were, as Mr. Macran's theory appears to assume, the result of a deliberate *à priori* combination of tetrachords. It seems far more likely that, at a very early period, and perhaps under foreign influences, the original four-stringed lyre received additional strings from time to time in various parts of the Hellenic world, ultimately developing into the complicated instrument which embraced not only the full octave, but several octaves.

We must crave our readers' mercy if we have dwelt even so long on a question which becomes interesting only after close study; but, while we could not ignore Mr. Macran's

clever theory, we could not properly even state it without some warning of its weakness. To those readers who have acquired a taste for these somewhat abstruse questions, we can recommend Mr. Macran's book as suggestive and excellent reading.

BOOKS OF THE WEEK.

SOME OF **Henry Holt & Co.'s** SPRING BOOKS

LORD LEONARD, THE LUCKLESS. This story of an English peer of to-day who made a Moloch of the truth, is by W. E. NORRIS, author of those truly great novels "Matrimony" and "No New Thing." The book is, however, in a more serious vein, and impressively tells a story that a less able writer would have been liable to make sensational. Some of the episodes are decidedly tragic, but Mr. Norris's humor does not desert him, and is used in effective contrast. $1.50.

TIOBA. These eleven tales, presenting a gallery of very varied Americans, are by ARTHUR COLTON, already known to the discriminating by his "Delectable Mountains" and "Debatable Land," and his stories in our leading magazines. His sympathy and descriptive power are notable, he has the saving grace of humor, and makes us think well of our fellow men. Tioba was a mountain which meant well but was mistaken. There is a striking frontispiece by A. B. FROST. $1.25.

A SUMMER IN NEW YORK. EDWARD W. TOWNSEND made his reputation years ago with his "Chimmie Fadden" stories, as master of a cheery humor. It strongly characterizes this new "love story told in letters." The tower of the Madison Square Garden bathed in moonlight adorns the cover, while the illustrated chapter heads emphasize the local color. $1.25.

THE TRIUMPH OF COUNT OSTERMANN, by GRAHAM HOPE, is the love story of Peter the Great's German Prime Minister. Peter, dissolute and violent, but glorified by his will and noble purpose, is strongly drawn. $1.50.

RED-HEADED GILL, by RYE OWEN. A very original story, in which a weird East Indian influence is a leading theme. The characters and scenes are strong, interesting, and often beautiful; and there is withal a very saving sense of humor. $1.50.

THE PRINCESS OF HANOVER, by MARGARET L. WOODS, author of "A Village Tragedy." Thomas Hardy calls this play "the book I have read with most interest and pleasure in the year." The princess is the unhappy wife of George I. $1.50 *net* (postage 7c.).

MONEY AND BANKING. Prof. WM. A. SCOTT writes in a plain, straightforward manner, intelligible to the general reader. $2 *net*.

VARIATIONS IN ANIMALS AND PLANTS, by Dr. H. M. VERNON. A treatise on biological variations and their relations to Darwinism, suitable for general readers as well as specialists. $1.75 *net* (postage 13c.).

TARDE'S LAWS OF IMITATION, translated by ELSIE CLEWS PARSONS, Ph.D. (*In press.*)

The third edition of **THE LIGHTNING CONDUCTOR,** by Mr. and Mrs. C. N. WILLIAMSON. *With a new final chapter*, $1.50.

FAVORITES OF THE EARLY SPRING SEASON

Youth

By JOSEPH CONRAD

Three magnificent tales of adventure on the world's waterways. The first work in several years from the greatest English writer of imaginative fiction, one who is recognized as the unchallenged master in his own field—the sea. He has produced nothing better than these stories.

"For sheer story-telling power Conrad stands at the head of all the younger English writers."—*Philadelphia Press.*

$1.50.

Conjuror's House

By STEWART EDWARD WHITE

Author of "The Blazed Trail," "The Westerners," etc.

A ringing love story, tender, yet full of stirring climaxes. A chronicle of a life full of romance, the life of the trappers and huntsmen on the northern fringe of civilization. In a trading post of the Hudson Bay Company, cut off from the world by five hundred miles of forest, Mr. White sets the stage for his stirring love-drama.

Cloth, $1.25

The Chameleon

By JAMES WEBER LINN

Author of "The Second Generation"

The struggle of a man's conscience with his character. The story is a profound one, penetrating deep into the mysteries of human nature; but it is told with charming lightness.

Cloth, $1.50

Anna of the Five Towns

By ARNOLD BENNETT

Author of the "Great Babylon Hotel."

The story of a sincere young girl's struggle for happiness amid the cant and hypocrisy of a straight laced non-conformist community in Staffordshire, England. It has been the success of the London Season, and has been crowned by the "Academy and Literature."

Cloth, $1.50

True Love

By EDITH WYATT

Author of "Every One His Own Way."

A keen satire upon modern life, especially as it is lived to-day in Chicago. It is an extraordinarily clever story, that reveals the romance inevitable in the existence of even the most ordinary mortals.

Cloth, $1.50.

The Better Way

By CHARLES WAGNER

A companion volume to "The Simple Life."

A book for hurried and worried Twentieth Century man, full of good counsel for hours of distrust and despair. Founded on sanity and cemented with love of nature and of man.

It is written so sincerely, simply and clearly that it cannot fail to deliver its message of comfort.

Postpaid, $1.07.
Net, $1.00.

McCLURE, PHILLIPS & CO., 141 E. 25th St., N. Y.

SPRING IS COMING

Zola's New Novel

Finished just before his death

Truth Truth Truth

Translated by E. A. Vizetelly

12mo. $1.50.

Second Edition on the Press. Eleventh Thousand.

This novel is the third of the group called "The Four Evangelists." Its plot is virtually a resetting of the celebrated Dreyfus case. The story sustains from cover to cover the reader's excitement and interest in a vivid dramatic situation.

The *Baltimore Sun* says: "A strong book; a fearfully strong book; the strongest novel Zola produced."

New Letters and Memorials of Jane Welsh Carlyle

A Collection of Hitherto Unpublished Letters, Edited, with an Introduction by

SIR JAMES CRICHTON BROWNE

Profusely illustrated in photogravure and lithography from hitherto unreproduced originals. In two volumes. Buckram, *8vo. $6.00 net.* [*Ready Early in April.*]

Mrs. Carlyle's letters are introduced and annotated with Thomas Carlyle's own characteristic tender comments, and entirely subvert James Froude's theories of their domestic relations.

A New Novel by Dora Greenwell McChesney

CORNET STRONG of Ireton's Horse

An Episode of the Ironsides

12mo. $1.50. Just Out.

Illustrated by MAURICE GREIFFENHAGEN.

By the author of "Beatrix Infelix," "Rupert, by the Grace of God," etc., etc.

A New Nature-book by Charles Goodrich Whiting

WALKS IN NEW ENGLAND

With 24 Full-page Illustrations from Photographs.

Large 12mo. $1.50 net. [*Ready shortly.*]

The same author's charming volume, "The Saunterer," together with the well-known columns in the *Springfield Republican*, makes Mr. Whiting familiar to readers as a poet and essayist drawing his inspiration from Nature.

JOHN LANE THE BODLEY HEAD 67 FIFTH AVENUE NEW YORK

PERMANENT BOOKS.

CHRISTOPHER COLUMBUS

His Life, His Work, His Remains, as Revealed by Original Printed and Manuscript Records, together with an Essay on Peter Martyr of Anghera and Bartolomé de las Casas, the First Historians of America

By JOHN BOYD THACHER, author of "The Continent of America," "The Cabotian Discovery," etc. Three volumes, royal octavo, comprising about 2,000 pages. Containing some 300 plates, which comprise portraits, reproductions in facsimile of manuscripts, views and maps. Very handsomely printed and bound.
Volume I., *net, $9.00. Orders taken for sets only.*

No single work of greater or even of equal importance has been published on this subject, save the unconnected papers in the Raccolta issued by the Italian Government. This work is a whole library of Columbian literature in itself.

The Life and Times of Georg Joachim Goschen

Publisher and Printer of Leipzig, 1752–1829. With extracts from his Correspondence with Goethe, Schiller, Klopstock, Wieland, Körner, and many other leading authors and Men of Letters of the Time. By his grandson, Viscount GOSCHEN. Two volumes. 8vo. With 14 photogravure, 3 lithograph and 27 other illustrations. *Net*, $12.00.

Anthology of Russian Literature

From the Earliest Times to the Present Day by LEO WIENER, Assistant Professor of Slavic Languages, Harvard University. In two parts. Each complete in itself and indexed. Each 8vo. With frontispiece. (By mail, $3.25.) *Net*, $3.00. Part I.—From the Earliest Times to the Close of the Eighteenth Century. Part II.—The Nineteenth Century.

"Should stand on the shelves of every library."—*Nation.*

AMERICAN POLITICS

The American Republic and Its Government
Political Parties and Party Problems in the United States

By JAMES ALBERT WOODBURN, Professor of American History and Politics, Indiana University. Two volumes. 8vo. Sold separately. Each, *net*, $2.00.

These companion volumes are designed for advanced courses in civics, and also for the use of the average American citizen, who will not fail to find full of interest these studies in government and politics.

Contemporary France

By GABRIEL HANOTAUX. Translated by JOHN CHARLES TARVER, M. A. To be completed in four volumes, of which each volume covers a complete and definite period. 8vo, with Portraits. Each, $2.50 *net*.
Vol. I. France in 1870—1873.

Diplomatist, historian, and member of the French Academy, M. Gabriel Hanotaux is one of the most conspicuous politicians and men of affairs in France at the present day. His work is a record of the inner diplomacy of the Great Powers of Europe during the last thirty years.

Penal Servitude

By W. B. N. Being an account of the Prison Experiences of Lord William Nevill. 12mo. $1.50 *net*.

A book that appeals to the general reader as well as to the student of criminology. There is a fascination in this description of prison life, and, written with touches of humor and pathos, it is a "human document" of surpassing interest.

NEW YORK—G. P. PUTNAM'S SONS—LONDON

SEND FOR FULL ANNOUNCEMENT LIST

Japan and Her People

By ANNA C. HARTSHORNE

Illustrated with 50 photogravures.

2 vols. Crown 8vo. Cloth extra, gilt top; in cloth box. $4.00 net

Miss Hartshorne writes of Japan and the Japanese people from an intimate knowledge of her subject at first hands, having been a resident of the country and brought closely into touch with native life. The book will take rank as a thorough exposition of the Island Kingdom, and is written in a charming style.

Vienna and the Viennese

Based on the Work of Tissot

By MARIA HORNOR LANSDALE

Illustrated with 25 photogravures and a map.

Crown 8vo. Cloth extra, gilt top; in cloth box, $2.40 net.

Vienna is in many respects the most fascinating and brilliant city in Europe. Miss Lansdale has handled the theme with her accustomed skill, making one of the most readable books of the year. The fine photogravures are quite equal to the others that have made the whole series so noteworthy and popular.

European & Japanese Gardens

Edited by GLENN BROWN, Sec'y American Institute of Architects

Italian Gardens, by Prof. A. D. F. HAMLIN, School of Architecture, Columbia University.

French Gardens, by JOHN GALEN HOWARD, Architect of the University of California.

English Gardens, by R. CLIPSTON STURGIS, Architect, Boston.

Japanese Gardens, by K. HONDA, of the Japanese Horticultural Society.

Small Quarto Cloth $2.00 *net.*

The only fully illustrated garden book published at a popular price. One hundred and forty-eight views of old-world palaces, villas and grounds, the works of the world's famous garden artists.

GRIFFIN SERIES

JUST PUBLISHED

Kent Fort Manor

By WILLIAM HENRY BABCOCK, author of "The Tower of Wye." (*Griffin Series, No. 2.*) Illustrated by W. Sherman Potts. 12mo. Cloth, $1.00.

The scene of Mr. Babcock's new novel is laid in the Chesapeake Bay and several of the chief characters are descendants of the William Claiborne who figures in his former book, but the time is that of the Civil War. There is a curious psychological problem of inherited memory involved in the plot which is sure to attract attention and interest.

The Archierey of Samara

A Russian novel, by HENRY LIOWIZI, author of "The Weird Orient," "In the Pale," etc. (*Griffin Series, No. 3*). Illustrated by Stephen J. Ferris. 12mo. Cloth. $1.00.

This is a thrilling story of some very interesting phases of Russian life by one who knows his subject thoroughly, having been born and passed his early years in the Russian province of which he writes. It will be found of absorbing interest and of much sociological value.

FOURTH EDITION

The Westcotes

By A. T. QUILLER-COUCH. (*Griffin Series, No. 1.*) Illustrated by J. L. G. Ferris. 12mo. Cloth, gilt, $1.00.

"A delightful story, told in his usual felicitous style."
—Chicago *Journal.*

"A sweet and tranquil idyll, fluttered, but not overwhelmed, by genuine passion."—N. Y. *Tribune.*

"The book shows that the author has progressed in his art to a position warranting a belief in his permanence."
N. Y. *Times Saturday Review.*

"A tale of rare delicacy and feeling."
Detroit *Free Press.*

56 FIFTH AVE., CHICAGO.

AN EDUCATIONAL DIRECTORY.

I.—THE NATION stands alone in its field. It has a larger circulation than any politico-literary journal published in this country, going to all the principal libraries and reading-rooms, and into thousands of families.

II.—The circulation is chiefly among the thinking and well-to-do classes—lawyers, physicians, bankers, and other professional men—and in the homes of cultivated people, where the education of children is a matter of careful consideration.

III.—The School List in THE NATION has been a representative one for many years. It includes cards of most of the prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

IV.—The rate is reasonable, and discounts are made on continous insertions, of which most of the school advertisers avail themselves.

School advertisements are printed in a uniform typography, with the address in the first line, classification being made by States, alphabetically, unless especially ordered displayed on other pages.

Advertising rates, 15 cents an agate line each insertion, with the following discounts: 5 per cent. on 4 insertions, 10 per cent. on 8 insertions, 12 1-2 per cent. on 13 insertions, 15 per cent. on 26 insertions, 20 per cent. on 39 insertions, 25 per cent. on 52 insertions.

The *Nation* is sent free while advertisement continues.

Orders may be forwarded through any responsible advertising agency, or directly to

THE NATION, 206 to 210 Broadway, N. Y.

THE CLARENDON PRESS

The Arab Conquest of Egypt and the Last Thirty Years of the Roman Dominion

By ALFRED J. BUTLER, D.Litt., F.S.A. With maps and plans. 8vo, cloth, $5.35.

The Harmonics of Aristoxenus

Edited, with Translation Notes, Introduction, and Index of words, by HENRY S. MACRAN, M.A. Cloth, $3.50.

Dante La Divina Commedia

Text by F. MOORE. Commentary by H. F. TOZER.

In response to several suggestions, it has been decided to divide Dr. Moore's text of La Divina Commedia, and Mr. Tozer's notes thereon, into three parts each. They can now, therefore, be purchased as follows:

Inferno Text
Purgatorio Text } 75 cents each.
Paradiso Text

COMMENTARY to each of the above, $1.00 each.

Appian Civil Wars: Book I.

Edited with notes and map by J. L. STRACHAN-DAVIDSON. 8vo, cloth, 90 cents.

A History of Agriculture and Prices in England

From the year after the Oxford Parliament (1259) to the commencement of the Continental War (1793). Compiled entirely from original and contemporaneous records by JAMES E. THOROLD ROGERS. Edited with sundry additions by one of his sons. Vol. VII. (*completing the work*) in 2 parts. 8vo, cloth. $12.50.

Also published by Henry Frowde:

Select Passages from the Introductions to Plato

By BENJAMIN JOWETT, late Master of Balliol College and Professor of Greek in the University of Oxford. Edited by Lewis Campbell, M.A., LL.D. 16mo, cloth, 85 cents.

"A wish has often been expressed that the late Master of Balliol's Introductions to his translations of the Platonic Dialogues might be published in a separate form. This step has hitherto been prevented by considerations which it is unnecessary to mention here. But it was thought that a select number of significant passages in which Professor Jowett had made Platonic interpretation the vehicle of his own thoughts might be of interest and use to many persons, for whom the examination of five octavo volumes might seem too formidable a task."—*From the Preface.*

Select Passages from the Theological Writings of Benjamin Jowett

Edited by LEWIS CAMPBELL, M.A., LL.D. 16mo, cloth, 85 cents.

C. J. PRICE

(IMPORTER OF FOREIGN BOOKS).

No. 1004 Walnut St., Philadelphia, Pa.

Comprising Americana, Choicely Illustrated Editions of Standard Works in French and English, many in Fine Bindings; Rare and Curious Books, Cruikshankiana, First Editions of Dickens and Thackeray, Lever, Leigh Hunt, etc.

THE REAL DIARY OF A REAL BOY

"In the introduction to his intensely amusing little book, 'The Real Diary of a Real Boy' (Everett Press), the author, Judge Henry A. Shute of Exeter, N. H., tells us that this record of the events of his happy boyhood was found by him while rummaging in the garret of his old home, where it had lain unnoticed for thirty-five years. Whether the 'diry' was really written down at the close of the full days of childhood, or composed in the maturity of man's estate, the reader cares not, for it is so full of genuine boy life and so apposite to the experiences of every healthy American citizen that none will question the veracity of the explanation of its origin. From cover to cover it sparkles with good fun, and as one follows 'Plupy' through his joys and sorrows a host of memories of the long ago rise into being. To read this mirror of mischievousness is to revel in a series of hearty laughs, culminating in a vista of recollections of one's happiest days."—*Chicago Tribune.*

The most delightful book of humor this generation has seen. It sells for $1. Handsomely printed and appropriately bound. Liberal discounts to dealers.

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.

LONGMANS, GREEN, & CO.'S NEW BOOKS

The Making of Our Middle Schools

An Account of the Development of Secondary Education in the United States

By ELMER ELLSWORTH BROWN, Ph.D.,
Professor of the Theory and Practice of Education in the University of California.

With full Bibliographies and General Index. Large crown octavo, pages xii-547, $3.00.

This book presents a comprehensive account of the development of secondary education in the United States, from the earliest beginnings to the present time. It touches on a wide range of topics: The European prototypes of American schools, the rise of school systems under civil control, important single foundations, the history of studies, great teachers and their methods of instruction, the later church schools, the new high schools of New York city, and many current problems.

THE LEADERS OF PUBLIC OPINION IN IRELAND

Flood—Grattan—O'Connell

By the Right Hon. W. E. H. LECKY. New Edition, 2 vols., crown 8vo, gilt top. $4.00 *net*. By mail or express extra. *[Just ready.*

This New Edition is greatly enlarged and rewritten, and contains a new Introduction.

THE THEORY AND PRACTICE OF THE ENGLISH GOVERNMENT

By THOMAS FRANCIS MORAN, Ph. D., Professor of History and Economics in Purdue University. Crown octavo, pages xii-379. $1.20, *net*. By Mail $1.32.

The purpose of this book is to place before American readers a concise account of the theory and practice of the English Government. An effort has been made to present within reasonable compass a description of the actual working of the English Government with some reference to its history and theory.

"It is not easy to think of any book published for many years that is likely to make a greater sensation than this work."—*Daily Mail.*

Human Personality

MR. GEORGE HORTON'S
Latest Book and Greatest Literary Success

IN ARGOLIS

Is meeting with praise from the highest authorities of ENGLAND AND AMERICA

THE ATHENEUM (London) says:

"We know no brief study of modern Greek life that is either more true or more attractive. His wanderings through lemon orchards and green lanes, with the sea in hearing, and the nightingales forgetting that it is day, make charming pages. . . . For Mr. Horton is both a poet and a humorist. . . . We warmly commend his charming book to all classes of our readers."

THE NATION (New York) says:

"Any one who has ever sojourned in Greece, or loved it from afar, will enjoy 'In Argolis,' and will read it more than once, in memory of skies and scenes and a people that must always haunt his imagination. And any gentle reader who knows nothing of Greece will find in these little pictures of a life that is far from strenuous something rare and genuine that approaches the qualities of a classic. He, too, will read this little book, if not for love of Greece, for love of literature and humanity."

THE CHURCHMAN (New York) says:

"We cannot say good-by to this really charming book without a word of commendation to the publishers for the singularly attractive form they have given alike to the pages and their binding"

"In Argolis" is a beautiful little volume to be read and kept and lovingly re-read. It is printed in the most distinctive manner of the Merrymount Press, Boston, and illustrated with full-page pictures in tint. In box, $1.20 *net*.

A. C. McClurg & Co., Publishers, Chicago

By VIOLET JACOB. *12°, net, $1.20*

So fresh, so wholesome, so original. —*The Spectator.*

A Girl Lost and Reclaimed.

MARY NORTH

A Novel by
LUCY RIDER MEYER, *$1.50.*

The Nation.

NEW YORK, THURSDAY, MARCH 19, 1903.

The Week.

The Panama Canal treaty was ratified on Tuesday. This is a new success for Secretary Hay, perhaps the most important of his career. It required a deal of wisdom and tact to steer between the reefs of Colombian susceptibility and American jingoism. The Colombians are sensitive on the subject of their sovereignty, and we are committed by a long line of stump speeches to the idea that the canal should be fortified by us whether it needs fortification or not. The treaty makes provision for defence of the canal by us, but not for permanent fortification. Doubtless Secretary Hay took the view that the United States is strong enough to defend the canal without permanent fortifications, and that it would be a waste of time and words and opportunity to discuss a question of so much delicacy now. Such debates are to be expected, however, among Senators who have so often hurled defiance at the Powers of the Old World on this subject. The speeches being now all made and the treaty ratified, the work of building the canal will be resumed where the French company left it. Some little sputtering may be expected over the ratification in Colombia, but it is not to be supposed that the $10,000,000 which we are to pay that country for the privilege of making it the highway of nations will be thrown away for any sentimental considerations by the politicians at Bogota.

What is chiefly significant in the correspondence between the Argentine Minister and Secretary Hay, made public last week, is the further clarifying of an obscure question. Shall South American countries be exempt from forcible collection of just claims urged by European nations? It has long been a favorite doctrine of South American legists—it is laid down in Calvo's treatise on international law—that one Power has no right to exact payment *vi et armis* of any pecuniary claim whatever. The attempt has been made to place this doubtful contention under the ægis of Monroeism. Mr. Hay, however, refuses to strain the Monroe Doctrine in that way. He states the position of the Administration to be that it will not undertake to guarantee any South American republic from punitive measures in case of defaulted obligation, but only that such "punishment shall not take the form of the acquisition of territory." That position itself is not without its embarrassments. With a fine air of generous impartiality, we say to European Powers, "Certainly, go ahead and collect your South American debts; we shall not interfere." But if the creditor proceeds to levy upon the only property he may be able to find, then we *do* interfere with our veto. Nor will we, when the awkwardness of the resulting situation is urged upon us, undertake to keep our troublesome neighbors in order. Such are the complications of the anomalous position. It is somewhat cleared up, however, by the exchange of notes with Argentina. That country repudiates all intention to disown just claims, and asks only for consideration, for regular diplomatic presentation, and for arbitration, if possible, before the appeal to force. That is good sense and ought to be good international law.

That the Senate should at last be willing even to consider a resolution to limit debate, shows that the shafts of public indignation are beginning to strike home. It is not alone Congressman Cannon, not merely the House of Representatives, but the country at large that is growing weary and ashamed of a Senate of grown men which can find no way of escape from filibusterers and marauders on its own floor. Senator Hoar has proposed that a manual of parliamentary law be printed for the special use of the Senate. It certainly needs it. If we had a Vice-President who would exercise the functions of the ordinary presiding officer, and call upon Senators to speak to the point and do business, reform might be begun. He would incur odium at first, no doubt, and would not have the backing of the majority of the Senate; but that would come in time, and the endorsement of the people would be given from the first to any man who boldly strove to free the Senate from the humiliating fetters which it has forged for its own limbs. Meanwhile, the Senate Committee may do something, by the time Congress meets again, to prevent the upper chamber from fulfilling Shelley's dream of a

> "Senate-house whose floor
> Is Chaos."

What has become of the international monetary conference to establish a ratio of exchange between the gold-standard countries and the silver-using countries? The last time we saw it, Senator Aldrich was incubating it in the Sundry Civil Appropriation bill. It had been knocked out of the Philippine Currency bill by the House, and the Senate had concurred in the knockout, but the latter immediately put it in a safer place (the Sundry Civil bill), with an appropriation of $100,000 to pay our share of the expenses thereof. Now, we find, by reference to the *Congressional Record* of March 3, that it was knocked out a second time by a conference committee, and that, instead of an international conference, we are to have some kind of diplomatic treatment of the silver question at a cost not to exceed $25,000. The paragraph, as passed by the two houses, is as follows:

> "To enable the President to coöperate through diplomatic channels with the Governments of Mexico, China, Japan, and other countries for the purpose set forth in the message of the President and accompanying notes submitted to Congress January 29, 1903, and printed as Senate Document No. 119, second session, Fifty-seventh Congress, $25,000."

Further inquiry points to the conclusion that the anti-silver members of the House accepted the Senate's Philippine Currency bill on condition that the international conference clause should be stricken out, and that the silver Senators consented to the striking out on condition that it should be replaced and enacted in an appropriation bill. These two mutually destructive bargains were made at opposite ends of the Capitol at about the same time. Both of them could not be carried out. So the international conference was abandoned, but its simulacrum was preserved, and one-fourth of the money was retained in the bill. The only important question now is how to spend the $25,000. Probably somebody can be found to use it for travelling expenses.

Having over-hastily confirmed the nomination of Major William Plimley as Assistant Treasurer of the United States at New York, the Senate has acted wisely in asking the President to delay issuing his commission pending further consideration and investigation. It now appears that the favorable report of the Finance Committee, on which the Senate acted, was obtained in an informal manner by Senator Platt, when the Chairman of the Committee was absent. The nomination was confirmed within two hours after it was received. There really seems to have been no scrutiny of the nomination whatever. Undoubtedly further inquiry is desirable, not only on account of the importance of the office, but also because of some unpleasant reports which have been current since the nomination was made. Platt, who is Major Plimley's sponsor, assures the public that it is "all right," and that the confirmation is "sure to go through" at an early date. This is Platt's habitual cheerfulness, showing a chastened spirit, with which we are now familiar.

The *Evening Post* is printing a series of dispatches and letters dealing with the political corruption of Rhode Island. No colony had a nobler history than lit-

tle Rhode Island, the home of religious freedom and of all civic virtues. And yet in spite of these fine traditions, in spite of generous provision for all grades of education, in spite of strong churches and able preachers, the country districts, under the malignant hand of a rich and powerful oligarchy, have sunk almost to the level of Delaware and Montana. The debauchery of Rhode Island has not been the work of a few years of pernicious activity like that of Addicks and Clark. Under the Constitution of 1842 each town and city has one member in the State Senate, to whose control, therefore, nothing is necessary but majorities in some of the small and feeble towns. For decades they have held the key to the Senate, and have been bribed by one party or another till now the electors literally have no conception of an honest vote. Against these conditions there has been a long, hard, and hitherto unavailing fight. The Republican boss, Charles R. Brayton, has kept an unshaken grip upon his rotten boroughs; street railways and other corporations that depend upon legislative favor have helped to throttle the commonwealth; and men like Senator Aldrich have risen to eminence through this degradation of their constituencies.

The Senate of Delaware voted on Monday, by 9 to 7, to repeal the Voter's Assistant law, by which bribery in elections is facilitated. This law allows the assistant to enter the polling booth and tell an ignorant voter how to mark his ballot. The system protects the vote buyer against the chance of being cheated out of his money. He need not pay until he sees the right ballot deposited in the box. Several attempts were made, before the recent election of Senators, to repeal this law, but they were defeated by Republican members who were virtuous enough to vote against Addicks, but not virtuous enough to disarm him and drive him away. The most surprising episode in the late proceedings was a speech made by Mr. Conner, one of the Addicks Senators, as published in the *World*. According to this report, Mr. Conner said that the Voter's Assistant law was a fair and commendable measure, because it insures delivery of the goods. "When I buy a horse," he continued, "I want my horse. When a Republican buys a vote, he wants his vote." He did not speak from any selfish motive, however. He wanted the Democrats to have an equal opportunty to secure what they pay for "instead of being cheated, as has been the case so many times in this State." Although the repealing bill has passed, it has to come for signature before an Addicks man as Governor.

Public attention of late has been so much engrossed in the political aspirations of J. Edward Addicks that it has overlooked some facts of interest regarding his financial affairs. There was published among the legal advertisements in this city, in the latter part of last December, a notice that, by virtue of a trust agreement dated January 1, 1889, between J. Edward Addicks and W. E. L. Dillaway of the first part, the Mercantile Trust Company of the second part, and the Bay State Gas Company of the third part, the said Mercantile Trust Company would on a certain day sell at auction 35,363 shares of stock of various gas companies situated in Boston and adjoining towns in Massachusetts. These were the properties of the Bay State Gas Company (of Delaware) of which J. Frank Allee, the newly-elected Senator of Delaware, was, and perhaps still is, President or executor *de bonis non*. The property advertised for sale was held by the Mercantile Trust Company to secure $12,000,000 of bonds on which default had been made by the debtor company, in respect of interest and sinking fund. Shortly afterward a suit was begun in the Supreme Court to restrain the Trust Company from selling the said securities, and a bill in equity was filed making various allegations and embracing numerous exhibits.

Among the latter was a correspondence between President Allee and Mr. F. W. Whitridge who had been for a short time, in 1897, a trustee of the Bay State Gas Company of New Jersey, the latter being one of the mortal forms assumed by the Addicks gas combine in its many transmigrations. President Allee, in his letter to Whitridge, dated January 17 of the present year, holds Whitridge and his associate trustees responsible for all that has happened to the property of the Delaware Company since December 7, 1896, including the threatened sale of stocks by the Mercantile Trust Company. The allegations of Allee embraced one charging that a certain trust deed had been executed to the injury of his company, which trust deed was illegal. "This allegation," says Whitridge in his reply, "was made although your company knows that it received a large consideration for the execution of said trust deed, which consideration was in part a package of five-dollar bills about seven inches high, paid over to your President, in the presence of several of your directors, three days before the Delaware election in the autumn of 1896." This is a contribution which might well be looked after in Mr. George Kennan's future explorations of the prison houses of Delaware. The injunction applied for to restrain the sale of the Bay State Gas Company's securities was not granted.

The highest vote on any of the Constitutional amendments in New Hampshire on Tuesday was about 40,000. This is only about half the vote in the election of 1902, and, much less than half the total of 1900, when it was 92,353. Such small votes require an explanation from the advocates of the referendum. The proposal to strike out the word *male* from the clause in the Constitution dealing with the elective franchise was beaten by a majority of almost 2 to 1, yet the amendment was regularly proposed by a Constitutional Convention, was definite and final in form, and ample time for discussion and agitation was allowed. Evidently conservative New England is still against woman suffrage.

It is astonishing how early, and at how many different places, the Presidential campaign of 1904 begins. We intended to claim the real starting-point for New York by showing that the fate of both parties would depend upon the success of some candidate for Mayor next fall, but Senator Foraker has anticipated us by announcing that Cincinnati has superior claims. The Democrats of that city have nominated Mr. Ingalls, the well-known railroad manager, for Mayor, and the Republicans have named a Mr. Fleischmann, not widely known to fame, but believed by Foraker to be "equally as good." The overwhelming reason, according to Foraker, why Fleischmann should be elected is that "this is the beginning of the great campaign of next year." He says "it is impossible to disguise this fact"; from which we infer that the Democrats are doing everything possible to conceal it, and are pretending that nothing but municipal issues, such as the rule of Boss Cox, are fit to be considered. Foraker will tear off that mask. He will show that not only in Cincinnati, but in all the cities of the Union, the Democrats are making believe that they are trying to reform local abuses while they are actually aiming to defeat the Republican party next year. The proof of this is that "everywhere they are preaching harmony and perfecting their organization." What better evidence could you have than that? If they were everywhere preaching discord and allowing their organization to fall in pieces, there might be some ground for saying that the nomination of such a man as Ingalls was intended for the sole benefit of Cincinnati, but when they are avowedly harmonious and energetic their designs must be dark indeed. In short, Foraker thinks that if Ingalls is elected Mayor, he will be "in line for the Governorship of Ohio and the Presidency." That would be awful.

The question may be properly asked whether there is any emergency warranting so much disturbance as the mortgage tax is producing in business circles. The Governor aims to get $5,500,000 more money from some source or sources to enable him to dispense with the so-called direct tax. The direct tax

is a call upon the counties of the State for their proportion of this sum. Greater New York pays 60 per cent. of whatever is thus called for, but Greater New York could better afford to pay the entire 100 per cent. than to have this tax put on mortgages. The disarrangement of existing contracts and the upsetting of present calculations, based upon the system heretofore prevailing, might involve losses greater than the amount of the tax itself. Good authorities estimate the total amount of existing mortgages in Greater New York at $1,500,000,000. A tax of four mills, if it could all be collected, would be $6,000,000—a demand made in an unaccustomed form and at an unexpected time, and, as regards the savings banks, life-insurance companies, and building-and-loan associations, contrary to the previously declared policy of the State. If the present direct tax can be considered an evil, it is a much smaller one than the proposed tax on mortgages would be.

Recently the State of Nebraska, which forty years ago was an open plain trampled by buffalo, and ten years ago was affirming with vehemence the vagaries of the Ocala platform, invested $300,000 of its permanent school fund in bonds of the staid old commonwealth of Massachusetts. It took them at 3¾ per cent., a rate lower than could be afforded by Eastern banks at the time. The State Bank Commissioner of Kansas estimates that 68 per cent. of the $80,000,000 in the banks of that State is owned by farmers, or those who depend on agriculture directly for a livelihood. It is little wonder that the legislators chosen by a constituency where new conditions and new ideas prevail, are inclined to caution. This growth in conservatism in Western communities is, after all, only a repetition of the history of other sections and other lands. With possession comes responsibility. Responsibility steadies a State as it does an individual. It has broadened and liberalized the West, not alone in its general laws, but in its more local applications of the functions of government. The new outlook has convinced the possessors of the plains that the old ways are the sure ways, and that human nature is much the same East and West when it comes to the care of one's own.

An impression prevails that the changes in the immigration laws adopted by the last Congress have been of a radical type, and that they will make the United States much more difficult of access than it was before. This is a mistake. The law has been strengthened in some particulars, but has not been materially changed. The head tax, formerly $1, has been raised to $2. Citizens of Cuba, Mexico, and Canada are exempted from paying it. Epileptics and persons who have been insane within five years are excluded; also beggars, anarchists, and persons who bring in lewd women. Skilled labor may be imported if labor of the like kind unemployed cannot be found in this country. Alien contract laborers are defined to include those who come to the United States in pursuance of printed advertisements in foreign newspapers, excepting, however, the advertisements of States or Territories of the United States setting forth the inducements they offer for immigration thereto. Wives and children of persons who have taken up permanent residence in the United States and have filed declaration of intention to become citizens, may be admitted, even if they are afflicted with dangerous contagious disease, provided this was contracted on board ship, and provided the landing can be permitted without danger to other persons. Two long sections of the new act provide for the exclusion of anarchists and for the prevention of their naturalization in case they gain admission; but since the evidence to prove anarchism must generally be obtained from the immigrant himself, these sections can hardly be considered deterrent.

The vote of the Pennsylvania Railway shareholders, giving authority for the issue of $150,000,000 new stock, coincided rather strikingly with last week's over-strained money market and Wall Street's heavy draft on Europe for relief. During several months, it has been the commonplace of financial criticism to say that American capital is "tied up"; or, to put the matter in another way, that our floating capital has been largely placed in fixed investment, where it is not available for the money market's present uses. This fact being recognized, the Pennsylvania's forthcoming application is of interest, not only because of its magnitude, but because of the reasons offered for it. The company's annual report stated that $67,000,000 would be needed immediately. At the meeting on March 10, these imperative needs were set forth by the company as follows: Doubling the track facilities from Pittsburgh to the East; grading and six-tracking the line across New Jersey; adding largely to the company's carrying power; and beginning provision for the enormous New York terminal expenditure. That these requirements are really urgent, the recent serious freight blockade at Pittsburgh proved conclusively, and it is reasonable to expect, as Capt. Green pointed out for the company, that constant expenditure, on a similar scale and for similar purposes, must go on for at least three years.

It is legitimate railway expenditure of this sort which leads to the rather familiar comment that the money and stock markets are "suffering from too much prosperity." This assertion is, however, one of those half-truths which are quite as misleading as absolute misstatements. There is, and all along has been, in this country, abundant capital for the financing of enterprises such as we have described. It is not the building of new railway tracks and terminals and bridges which has overstrained the money market and depressed the general level of investment values. The trouble now, as last year, is the huge mass of capital appropriated by our promoting financiers and our ambitious corporation managers for the purpose of buying up existing properties at extravagant valuations—such, for instance, as the forty or fifty million dollars raised on their notes, two months ago, by the Pennsylvania Company itself, and the Lake Shore, to buy up stock of the Reading Railway Company.

Another seat was lost to the Conservatives on Wednesday week, at the same time that the Ministry was saved from defeat in the House only by the abstention of the Irish Nationalists. The price which the latter are to get, or to demand, for their complaisance, we shall know only when the new land bill is introduced. The figure certainly will have to be a high one to make up for the recent quiescence of the Irish in the House. Economists recognize a right to profit from abstention or self-sacrifice; and Irish abstention will expect to be capitalized at a high rate in Mr. Wyndham's land-purchase bill. Moore said of his countrymen that they were always either "blarneying or brawling." Blarney has reigned triumphant for the past few weeks, but the brawling may confidently be looked for if Irish expectations are not met.

Emperor William does not seem to have chosen a happy moment for pardoning a convicted army duellist. His act comes directly upon the heels of an acrimonious debate in the Reichstag on the subject of duelling in the army. The Liberal and Socialist Deputies distinctly had the Minister of War on the defensive. He had to promise to do all he could to put down the duelling practice. Yet here comes the Emperor extending clemency to a peculiarly flagrant offender, who had been sentenced by a military court to two years' imprisonment. His case was one of those which most inflame the German people, since it was a civilian whom he had killed. A very bad effect must be produced by his pardon—not only in the army, where the swaggering exponents of the duello will now feel that they have the Kaiser with them, no matter what public opinion may be, but also in the ranks of the Social Democrats, where the opposition to oppressive militarism, with its barbaric notions of "honor," will be more bitter than ever.

MORE CUBAN JUGGLING.

The Cuban Treaty is to be ratified—by neatly killing it. The lurking enemies of the treaty have walked up to it with smiles, have said to it, "Art thou in health, my brother?" and have deftly inserted a knife under its fifth rib. This weapon was wrapped in an amendment, accepted by the Committee on Foreign Relations and reported to the Senate, in these terms—"This treaty shall not take effect until the same shall have been approved by Congress."

To appreciate the significance of this, we have only to look back to the regular session. Early in its course, Senator Cullom reported a resolution, and made a speech upon it, maintaining that the approval of the House was not necessary, even in the case of a treaty affecting the revenue laws. He took strong Constitutional and historic ground, and stood up for the prerogative of the President and the privileges of the Senate as the treaty-making power. The House had a duty, of course, in passing laws in execution of a treaty, but it had no right to be consulted in advance, or to block ratification. That could be perfected without its consent. Moreover, when the very amendment now adopted was offered last winter, it was voted down as both derogating from the dignity of the Senate and imperilling the treaty itself. The fear was that the House would not approve. It was in session then, and the friends of the treaty dared not risk submitting it to a vote in the House. Now that the House is not in session, they deliberately provide for action by it which may not be had, of course, for a year or more, if ever. The treaty is, indeed, passed on to the Representatives with a pretty broad hint that they are expected to do the final slaughtering which the Senate finds it inconvenient to undertake at this time. Thus what we have is a good deal like ratification by burial.

This surrender by the Senate of one of its prerogatives which hitherto it has asserted most stoutly, has a sinister look. Why was the thing done just at this time, and in connection with just this treaty? We can see no answer except that the Senate sought to do by indirection what it lacked the courage to do in a straightforward way. Willing to wound and yet afraid to strike, it passed on the dagger to another hand. Historically, of course, the House has always had *a* right in connection with treaties, but never the right now tossed to it by the Senate. The question was fought out at the very beginning of the Government, in connection with the Jay treaty; there were those who then asserted the equal voice of the House in the ratification of treaties, but that claim was not sustained. Under its power to refuse legislation necessary to carry out a treaty, the House may, of course, nullify it after the event. This it has never done, we believe, except in the case of the treaty of reciprocity with Mexico. But in the present instance, the volunteered suggestion by the Senate is too broad. "Here is the treaty," Senators say, in effect. "It was an Administration measure, and we could not very well refuse it. But, as you see, we have merely arranged to keep it in suspended animation for a year, and shall then look to you to squeeze the last breath out of it."

President Roosevelt has urged the ratification of the treaty for three reasons. We were in honor bound to give the Cubans a market. But that was the easiest thing in the world for the Senate to get over. It had as contemptuous an opinion of "honor" as Falstaff. Next, said the President, this treaty is a part of our "world-policy." Cuba is within our sphere, and we must treat her so that she will always be looking to us, not to Europe. But world-policy ran up against "my-deestrict" policy, and was ignominiously beaten, not for the first nor the last time. It is humiliating, but it is a solemn fact, that just when you are getting into a fine glow over your plans for dazzling the world, some man from the backwoods, some friend of the beet or of a smuggled herring, rises up to say, "Oh, shucks!" and brings your grandiose programme to the ground. Our ardent Imperialists forgot this, but the failure of their Philippine tariff, and now the burial alive of their Cuban treaty, ought to remind them that there are more things in Congress and in the course of legislation than were dreamed of in their eager young philosophy.

The President also made a plea for the Cuban Treaty on the ground that it would be a good thing for the trade of both countries. We should buy more of Cuba, Cuba would take more of our products. That the latter would have been the sure result of putting the treaty into effect, is fully admitted in the report of the committee on the subject made to the Cuban Senate. It stated that the treaty would so favor American goods that they would have an advantage over all competitors. This, of course, was precisely the fear of English and French exporters to Cuba, and was the reason of their flurried concern. The enlargement of a profitable trade within our reach was unmistakable. Why, then, did we not take it? Why did the Senate determine to keep everything hanging for a twelvemonth or longer, and continue that uncertainty which, the Havana dispatches say, Cuban planters and merchants dread more than they did the outright rejection of the treaty? For no reason, except that the sacred tariff was involved. We should have to reduce a few duties, and the selfish interests that insisted upon their retention were too strong to be dislodged. A greedy, a sullen, an entrenched protectionism has again blocked President Roosevelt. And he is only beginning to find out the hatred it cherishes for any man who dares to lay a hand upon one of its inviolable schedules.

REMEDIES FOR THE BOYCOTT.

The law-abiding citizens of Waterbury, Conn., have been afflicted for some weeks with an interruption of street-car traffic due to a strike of the employees of the local trolley company, accompanied by threats and violence against persons who attempt to run the cars, culminating in the murder of a policeman. A boycott has also been declared against all persons who ride in the cars, and the whole community has been, and still is, under terrorism and mob rule. The condition has become unbearable, and at last the citizens who are not primarily concerned in the controversy have been driven to the necessity of organizing against organized labor. At all events, they have been forced to consider what means may be open to them to escape from the torments of the boycott.

The question involved in the strike itself is the least important thing to be here considered. The most important is the right of each citizen to be unmolested in his person and property so long as he obeys the laws, pays his taxes, and does not violate the equal rights of any other person. When this right is denied and infringed by an individual, he is usually sued for damages or indicted by the grand jury; in an aggravated case, is sent to jail. When it is done by a large number of persons in combination, then usually nobody is sued or punished in any way. The mobbing and the boycotting go on indefinitely until one or the other of the parties to the original quarrel is reduced to exhaustion. Meanwhile, the mass of the communtity, innocent of any offence, have endured privations and inflictions of many kinds, have suffered cruel anxieties, while, perhaps, their business has been ruined.

The conditions existing at Waterbury are very common in the United States. There are dozens of strikes going on or preparing now, and each one is liable to be converted incontinently into a boycott. The legal right to strike is not denied, although some limitations as to time are put upon it by the courts in rare instances where public interests are deeply concerned. Generally speaking, the right of workmen to sell their labor freely and to bargain either singly or *en masse* is never called in question. When, however, this right is perverted to a boycott, it becomes an attack upon society as a whole, and one which ought to be resisted by society as a whole. If A has a quarrel with B, he has no right to demand that C, D, and E shall espouse his side and fight his battles. That is what the boycotter demands; and as long

as society tolerates the imposition, boycotts will multiply and the loss and suffering will increase and deepen.

It was perceived some years ago by certain groups of employers that capital could not maintain itself against organized labor unless it were itself organized. If the workingmen in a particular trade can strike against all the employers by turns, they can bring them all down by turns; but if the employers agree to stand by each other, they can fight an equal battle. In no other way can they hope to do so. The old maxim that in union there is strength applies to them as it does to their employees, or to the bundle of sticks in the fable. A strike is now threatened in the shipbuilding trade, and the shipbuilders have formed a union to protect themselves. Whatever they do will be done in common. No one will seek to gain an advantage over his competitors in the same trade while a common danger impends over all.

Now, Waterbury and all other towns afflicted by boycotters will have to learn the same lesson and adopt the same method of self-protection. Society must protect itself against boycotting practices. This is not so difficult as it seems. Society is already an organization. It makes the law, and it has officers and courts to enforce the law. Mobs, and boycotters, and murderers, and dynamiters are lawbreakers. It is only necessary to execute the laws, and if they are insufficient, to ask the Legislature for new ones. But it will be found in the vast majority of instances that they are sufficient now, and that the only thing wanting is a determined effort to enforce them. If society in Waterbury is supine and nerveless, if the citizens are cowed by the lawless members of the community, if they are so fearful of the loss of patronage that they dare not uphold the rights which the laws guarantee them, they will soon have no rights at all. People who can move away from the town will do so, and those who are so fortunate as not to have homes or property there will avoid the place.

These words are applicable to many other cities besides Waterbury. The evils which exist there have been witnessed in hundreds of towns, large and small, during the past ten years. The city of Chicago was a prey to a boycott in the building trade, where boycotting was practised extensively by both sides, and which lasted eighteen months. One of the valuable results of that prolonged struggle was a pamphlet compilation by Mr. James A. Miller, Chairman of the Legal Committee of the Building Contractors' Council, showing what legal remedies exist for combating the illegal doings of organized labor. Those who read it will be surprised to find how many of the practices commonly used to coerce employers and the public generally to do things contrary to their inclination and their interest, are illegal and remediable in the courts, if the sufferers will unite and boldly fight for their rights.

THE CZAR'S DECREE.

The decree with which the Russian Emperor has commemorated the birthday of his late father, is rather a declaration of principles than a programme of reforms. It is notable for a certain nobility and religious exaltation, which are quite worthy of the mind that first conceived the idea of universal disarmament; but it leaves the student of Russian affairs in some doubt as to the actual changes that are planned in the present political order. The Czar, it is clear, evidently desires (1) complete religious toleration, (2) increase in the powers of the provincial and local assemblies, (3) relaxation of some of the old and tyrannous practices of the village community *(Mir)*.

Nominally, a considerable measure of religious toleration already exists in Russia; but, practically, the local officials have the power to persecute dissenters of all sorts. It is not likely that the Czar can contrive any different system. He hopes, undoubtedly, that this striking expression of his own will may have an abiding moral effect upon all Russian bureaucrats in contact with unpopular sects. The lodging of greater powers in the provincial assemblies (zemstvos) is probably the most far-reaching principle set forth by the Czar. Prince Kropotkin and many other intelligent Russians have long felt that, with the expansion of the Russian Empire, the bureaucracy was breaking down in operation. These observers have predicted that decentralization must take place, or the Imperial machine fall apart from severity of strain. Evidently this is the opinion of the Czar, since he plans to put a larger part of the financial control of the provinces in the hands of those popularly elected bodies, the zemstvos. But any such changes will come about very gradually, and all these reforms are more or less dependent upon the good will of a not very friendly bureaucracy. The Czar's philanthropic designs will sooner take effect in the modifications of certain oppressions of the system of village control.

To a Russian, the *Mir* signifies indifferently his world and his village. It may ostracise him, or, again, it may forbid him to leave his unprofitable acres; through the taxing right it may for a long period control his person and his labor. These rights come from immemorial use, and it is conceivable that their abrogation may be unpopular even with those whose conditions of life would thus be made easier. Yet it should be assumed that the convenience of the changes will soon recommend them, even though they mean a profound modification in the most characteristic of Russian institutions—for the *Mir* was old long before provincial councils or the Empire itself had appeared.

A careful examination of the decree will show that it is not an emergency measure, but the announcement of a new and permanent policy. It is not the answer to the industrial strikes or the student riots of last year, for the reforms will affect chiefly the peasants and the rural nobility. It goes deep below the thin strata of discontent to the bedrock of national life. It is not precisely a response to the recent conferences of the provincial councils held by the Emperor's order, for it appears that the Minister of the Interior, M. Plehve, did everything in his power to make these reform conferences meaningless, and to divert the conferees from real issues. The Emperor has apparently gone over the head of his own Minister, and has faced the problem of local government on general principles of fair dealing. It seems equally certain that the proclamation of religious toleration must be distasteful to M. Pobyedonostseff, the Procurator-General of the Holy Synod. It is like Nicholas III. to cherish generous imaginings, but it is not like him to cross two of his most prominent advisers. For this reason, many will ask, Who encouraged the Czar not only to imagine, but to take so bold a step? And many will conjecture that M. Witte, the Minister of Finance, has seen in the Czar's beneficent plan an opportunity for fiscal reorganization.

Whatever may be the actual outcome of the Czar's decree, it will remain a most honorable monument to his memory. The warmth of the phrasing comes unquestionably from his own heart. Hundreds of interested voices must have told him that the step was a dangerous one, and that his sentimentality would mean the ultimate destruction of the Empire itself. To all such his answer, through this decree, has been, "I choose liberty, though perilous."

The growth of a genuine Liberal party in Russia is interestingly described by F. Volkhovsky, in the *Contemporary Review*. The movement started partly as an offset to so-called Nihilism. Without elaborate organization, a common purpose bound together a great number of nobles and university men in the county councils. In a necessarily informal and secret conference held last summer in Moscow, the Liberals made specific requests for judicial reform, universal primary education, the popularizing of the elections to the zemstvos, the reduction of Government income to actual expenditure, the removal of the censorship. It is needless to say that these pioneers of reform have been vehemently opposed by the Minister of the Interior, Plehve, as they were by his predecessor, the murdered Sipaguine. The local officials of the Empire made it their care to stifle pertinent discussion

in the zemstvos, and to keep the leaders in a state of fear. The only organ of the party is naturally not published in Russia, but abroad, in Stuttgart. This new constitutionalism is significant, first, because it seeks gradual and possible reforms; second, because its adherents are people who have a stake in the community. Abortive as the efforts of these Liberals appear, their agitation cannot be looked upon as vain; the Czar's rescript foreshadows many of the reforms suggested at the Liberal conference of last summer, particularly the granting of additional powers to the provincial councils.

The Czar's effort to lift up the muzhik wins unstinted praise from the very American newspapers which would have the negro kept down. This is strange. Do they wish it to appear that they like the doctrine of equal human rights only in Russia? The same arguments which they have used against President Roosevelt's policy of negro appointments would apply as well to the Czar's decree in behalf of the Russian peasants. Why give them a measure of local self-government? It will only encourage them to demand impossible things. And it is certain to "make trouble." The kindly relation between the great landowners and the ex-serfs will be sure to be broken up. As for "forced labor," of course, that has an unpleasant sound, but, after all, does it not correspond to the hard fact? If the muzhik is not compelled to work, will he work at all? Thus to abolish the *corvée* would simply fill the land with sturdy beggars. So the argument might run on indefinitely. All that we say is that if it is good for the Russian peasant to have the door of hope set open before him, so it is for the American negro. And we do not wish to confine our praise to those who are trying in a foreign land to elevate the ignorant and downtrodden.

LOUISE DE LA VALLIÈRE.

PARIS, February 25, 1903.

M. Lair, a member of the French Institute, has published a new and more compendious edition of his biography of the famous Louise de la Vallière, who was so long a favorite of Louis XIV. before she entered a Carmelite convent. Mademoiselle de la Vallière is the type of the "illustrious penitent," and wears about her a sort of half-romantic, half-religious halo. Her letters, long known only in a sort of rhetorical arrangement, have been found, transcribed in their exact text, at the little château of Bures, in the valley of Chevreuse. M. Lair began his work in that château, and dedicates it to the lady who was its proprietor at the time when he attempted to write the life of La Vallière.

Louise was born at Tours on the 6th of August, 1644. Her father, Laurent de la Baume Le Blanc, added to his family name that of the estate of La Vallière, which was near Amboise. She became, at a very early age, one of the ladies of Marguerite of Lorraine, the second wife of Monsieur, Duke of Orleans, who lived in exile at Blois. When Louis XIV. took with his mother, Anne of Austria, a journey to the Spanish frontier, where he was to find an Infanta, his future wife, he stopped on his way at Blois, his mother wishing to detach the young King from Mazarin's niece, for whom he had conceived a passion. Louis XIV. paid no attention to the young La Vallière, who was afterwards to play such a great part in his life.

After the death of Gaston d'Orléans, his widow did not remain at Blois. She left immediately for Paris, where she established herself in the Luxembourg, which was then called the Palais d'Orléans. Louise de la Vallière continued to live near her, and to be the companion of the three princesses of Orleans. The eldest of these had been thinking some time of becoming the Queen of France, but Anne of Austria had never been willing to favor this alliance. Mademoiselle de la Vallière, who was only sixteen and a half years old, had many bad examples before her. The princesses were jealous of each other; both of them wished to marry the young Prince Charles of Lorraine. The Prince asked for the hand of the eldest, who was the richest, though he preferred her sister Marguerite. The despair of Marguerite was very great; the hand of the Prince of Tuscany was offered her, but she would not at first hear of it. "The King," she said, "was a tyrant." She fled for a time to a convent. "Every day she went out hunting, and sometimes lost herself in the woods, followed by her cousin Charles of Lorraine; she came back at night dishevelled, with her habit torn." All this did not prevent her from being married in April, 1661, to the Italian prince.

The same month, Monsieur, the brother of the King, was married to Princess Henrietta, the daughter of the King of England. Monsieur received the appanage of Gaston d'Orléans, whose widow had no more need of her many ladies. Mademoiselle de la Vallière did not, however, return to her province, and, through the influence of Madame de Choisy, wife of the ex-chancellor of Gaston d'Orléans, she was named one of the maids of honor of the new Madame. This place gave her a pension of a hundred livres (equivalent to about five or six hundred francs a year). This sum would hardly have paid for her clothes, but her living was assured, and she had a good chance of finding a husband. The young La Vallière accepted the offer. She had two unmarried sisters; her parents were poor. She was to leave the Luxembourg, the austere Dowager of Orleans, the fanciful Grande Mademoiselle, and to enter the Tuileries as maid to Madame, the sister-in-law of the King. It seemed to her the most brilliant of dreams. In this new world she was pronounced to be "very pretty, very sweet, very innocent." Monsieur the Duke d'Orléans was amiable; the young Princess Henrietta was the granddaughter of Henri IV., the daughter of Charles I. There was a sort of poetic halo round her.

Louis XIV., who had felt a great dislike to Princess Henrietta when he first saw her, found her much changed to her advantage when she became Madame. She conquered him, and at Fontainebleau he gave a succession of feasts in her honor. The young La Vallière was thrown into the whirl without any guide; she had no intimate acquaintance except another maid of honor, Françoise de Montalais, a dangerous intriguer. A picture, attributed to Mignard (and reproduced in engraving in M. Lair's volume), shows a mythological Louis XIV., in the dress of a shepherd, with Madame and her six maids of honor. All the ladies wear the ringlets which were the fashion of the time; two of them have little pet dogs. Apollo looks very languid, and two little loves are flying in the air. The King saw La Vallière at every moment, and became attached to her; she fell in love with him. Her resistance, it must be confessed, was not protracted, and the King's victory was easy. Louise, who had arrived at Fontainebleau in the month of May, was, before the end of July, the King's mistress. The Queen Mother had been completely deceived by the King's familiarity with Madame; she had seen the danger where it was not, or where it had been only for a moment.

Among those who had paid their court to La Vallière was the famous Superintendent Fouquet. He had the impudence to make her, through a disreputable lady, the offer of a sum of money. Louis XIV. became all the more angry with Fouquet in that he was afraid of him. He had already resolved to dismiss him. In the midst of the great festival at Vaux, Fouquet's magnificent château, the King expressed to his mother the desire to have him arrested. The Queen-Mother remonstrated, and invoked the laws of hospitality. Louis XIV. contrived a journey to Brittany with Fouquet, and had him arrested at Nantes. The unfortunate Superintendent was imprisoned some time in the castle of Amboise, where La Vallière had spent the best years of her childhood; and, by a curious coincidence, the King's lieutenant at Amboise was then François de la Vallière, Louise's own brother.

During the King's absence, La Vallière lived very quietly in her little room under the eaves at Fontainebleau. The King was so anxious to see her that he rode one day thirty-seven leagues, an exploit which was much admired. He had forbidden his mistress to take Mademoiselle de Montalais, whom he disliked, into her confidence. She had imprudently done so, and refused to tell Louis XIV. the secrets of Montalais, who helped Madame in her intrigues. Louis XIV. made such a scene with La Vallière that she ran away and took refuge in a convent near Chaillot. She was admitted with great difficulty. As soon as Louis XIV. knew of it, he ran to Chaillot, found her in tears, obtained from her a confession of the intrigues of Montalais, and sent for a coach to bring her back to the Tuileries. The hour of La Vallière's final retreat had not yet struck, but her flight shows in what direction her thoughts were already moving.

The favor shown her made her great enemies, though she was not ambitious, and we read in the History of Madame Henriette that "if she did not profit by the advantages and the credit assured by such a great passion as the King's, it was because she had little *esprit*." A favorite was considered at that time a political power, but La Vallière never wielded such a power. Among her most bitter enemies was the Countess de Soissons, Olympe Mancini, one of the nieces of Mazarin; with

the help of the Marquis de Vardes and of the Duke de Guiche, she advised Maria Theresa by an anonymous letter of the King's relations with La Vallière. The letter fell into the hands of the King (as it was supposed to come from Spain), and the Queen did not see it. During this incident, Bossuet was preaching before the King. "Louis," says M. Lair, "admired the genius of Bossuet, and paid great compliments to the orator; but of his apostolic counsels he made two parts: as a man, he showed great indulgence to himself; as a prince, he showed himself severe towards others. Guiche and Montalais, who were decidedly mixed up in too many intrigues, were exiled."

M. Lair follows La Vallière from month to month in her new life. She had to leave the court when she became a mother, and she spent the time of her retreat in a house near the Palais-Royal, which the King gave her. The first-born of Louis XIV. and of the favorite saw the light on the 24th of December, 1663. A new life was beginning for her. She was recognized as favorite only at the end of 1664; this gave her a sort of official position, and allowed her to take her place again in the rooms of the Queen-Mother and of the Queen. In 1665 she had another child, a boy. At the time of the death of Anne of Austria, the passion of Louis XIV. was already coming to an end; the rising star was Françoise de Montespan, who belonged to the illustrious family of the Rochechouarts, and was a great wit as well as a great beauty. M. Lair enters into the most minute details on the subject of the efforts made by Madame de Montespan to conquer the King. She did not hesitate to ask for the help of the infamous Voisin against La Vallière. M. Funck-Brentano told us not long ago the whole story of the trial, which bears the name of "the trial of the prisons." M. Lair, a most conscientious writer, has a full chapter on the same subject: "All," he says, "that follows is part of a long and minute judicial inquest, made by a man of rare honesty and penetration. Later, the royal authority attempted to annihilate the traces of these odious superstitions; but the truth has come to us. It is certain now that many ladies asked the woman Voisin for means to obtain the favor of the King."

Madame de Montespan had no need of the horrible incantations of the Voisin, of the abominable "black mass" which was celebrated over her by an infamous priest; it was enough that Louis XIV. had become tired of La Vallière—she had ceased to amuse him. Of the two children that he had had by her, only one lived, a little boy. She had another child, which was born at Vincennes, a girl, at the time when the term of her favor was already marked.

I have no space to linger over the last moments which La Vallière spent at the court; it is well known that she left it for a Carmelite convent, and it is chiefly on account of her conversion that she has taken a special place among the favorites of Louis XIV. The legend will have it that she loved the King for himself, and has invested her with a sort of romantic halo. M. Lair's book, so valuable for its details and *précis-documents*, does not, in my opinion, give a special preëminence to Mademoiselle de la Vallière. She was an ordinary person, with ordinary feelings; and "after all," as the Grande Mademoiselle said, "she was not the first person to be converted."

Correspondence.

ECONOMIC ADMINISTRATION IN CUBA.

To the Editor of The Nation:

Sir: Your article of March 5, dealing with the Cuban financial situation, seems to me very misleading and unjust to Gen. Wood's administration in at least one important particular. Without other information, the reader would, I think, gather from your article that the different results attained under the three régimes to which you allude were due entirely to ability in the administration of affairs. You say that the surplus under the Palma administration was "attained on the basis of practically the same revenue and *without curtailing the public service*" (italics are mine). I have not at hand the data to enable me to call in question your statement as to revenue. I have, however, before me, in the Annals of the American Academy of Political and Social Science (March, 1903), Gen. Wood's paper on the military government of Cuba. Every one interested in the Cuban situation should read the paper referred to, and no one who reads it will, I am sure, accept the plain inference of your article that the demands upon the Wood and Palma administrations were substantially the same.

The work done by Gen. Wood in Cuba, in creating a government, in establishing sound sanitary conditions, courts, public schools, proper prisons, and, in fact, nearly everything that constitutes a civilized government, not only out of chaos, but under most unfavorable circumstances and environment, was the work of a genius, and of one who had his whole heart and soul in the enterprise. The stamping out of yellow fever alone is worth to the island twenty surpluses, and it is impossible to compare the cost of such work of construction with that of conducting the government after being organized and put into going order.—Yours very truly,

Max Levy.

Germantown, Pa., March 8, 1903.

[We did not question the value of the services rendered by Gen. Wood; but we think that those who know most about the details of his administration are agreed that it was extravagant. His last budget (we take the figures from the new Cuban journal of finance, *El Economista*) showed receipts of $18,791,473, and expenditures of $19,514,603. The corresponding figures for President Palma's first year are $17,548,924 and $15,389,901. This great saving in outlay has been effected, says the *Economista*, "notwithstanding the new services created, the increase in the rural guard, and certain extra expenditures."—Ed. Nation.]

SELF-SUPPORT IN SOUTHERN COLLEGES.

To the Editor of The Nation:

Sir: It is a general belief that Southern students rarely, if ever, make the money they spend on their education. I have collected information which, summarized here, will show that there is a fair percentage of students in the South who make part or all of the money required for their collegiate expenses.

The collegiate authorities do all in their power to aid the needy student. In agricultural and mechanical colleges almost all the hired labor is performed by students, who receive from eight to twenty cents for an hour's work. They do various kinds of work about the shop, run the engines and dynamos, fire the furnaces, sweep the floors, and clean the machinery. On the college farm they milk the cows and aid in the work generally. Students carry the mail of the university, clerk in the book store, ring the bell for the hours of recitation, assist in running the press.

A student's first thought, when left to his own resources for a way to earn money, is an agency. The most common agencies are for wood, coal, books, clothing, shoes, laundry, and insurance. Occasionally a student opens a barber shop on the campus, or runs a pressing club. Some students are janitors of the literary societies, of the dormitories (as in the University of Arkansas), and of churches. Others saw wood, garden, work around the yards and stables of families in the town. Waiting at the table is confined to student bodies, to the mess-halls; but student waiters are to be found in some institutions in almost every Southern State. Last year twenty-five waited on the table at the University of North Carolina. Not a few manage messing clubs, or even do their own cooking. Students get work in town as bookkeepers, typewriters, or collectors.

During the summer months many students work on farms, teach schools, fill positions of surveyors, telegraph operators, clerks in stores and hotels, reporters, conductors on railroads. Many are agents for books, pictures, stereoscopic views, or fruit trees.

Of 804 students at the University of Texas, 268 made the money they were spending on their education, and 154 contributed to their support while students. At South Carolina College one man in seven makes a part or all of his collegiate expenses, which is about the average.

Edwin L. Green.

South Carolina College, March 11, 1903.

LYNCH'S CREEK.

To the Editor of The Nation:

Sir: In the article on "Lynch Law," in No. 1953 of the *Nation*, there occurs on page 441 this sentence: "It has been asserted that lynch law derived its name from Lynch's Creek, S. C., because at that place the practice of lynching began. This derivation of the term has yet to be proved," etc.

An example of the use of the word in connection with this creek, and of the wide range of meanings which it could have, is found in a journal kept by the Rev. William H. Wills, a Methodist minister of North Carolina, who travelled in his sulky from Tarboro, N. C., to Alabama, in the early summer of 1837. After describing a narrow escape from drowning in an at-

tempt to cross Lynch's Creek while it was swollen, he says:

"Probably I shall never forget Lynches Creek; for it had well nigh Lynch[d] me."

This journal is now appearing serially in the Publications of the Southern History Association, and the sentence in question is on page 479 of volume vi. (November, 1902).

GEORGE S. WILLS.

WESTMINSTER, MD., March 9, 1903.

DR. GARNETT AND CERTAIN SOCIETIES.

TO THE EDITOR OF THE NATION:

SIR: Dr. Richard Garnett, former Keeper of the Books at the British Museum, has sent me a letter, of which the enclosed is a copy, and asks me to send it to one or more literary journals or newspapers to be published. Dr. Garnett says that he has been pestered a great deal of late, and desires to prevent, if possible, the indiscriminate and unauthorized use of his name as sponsor for various questionable commercial enterprises. He therefore desires that general publicity be given to this denial of his affiliation with the two concerns he mentions.—Yours very truly,

D. D. HARPER, Treasurer.

BOSTON, March 12, 1903.

SIR: Understanding that my name has been widely advertised in connection with an "International Bibliophile Society" at New York, I feel compelled to disclaim all knowledge of this society, except as concerns the circumstance referred to. The only Bibliophile Society in the United States of which I have any cognizance is the Bibliophile Society of Boston, with which I esteem it an honor to have had relations. I further beg leave to disclaim all connection with a so-called "Anthologists' Society," which appears to have made use of my name in a manner entirely unauthorized by me.

I remain, sir, your faithful servant,

R. GARNETT.

HAMPSTEAD, ENGLAND, February 20, 1903.

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: My attention has been called to a brief review, in a recent number of the *Nation*, of the Physical Papers of the late Professor Rowland, and, as Secretary of the committee in charge of the publication of these papers, I think it necessary to call your attention to certain misstatements in the article referred to.

In the first place, the reviewer says that the reprints of some of the experimental works are "too much abridged to answer all the purposes of the critical student." As a matter of fact, every published paper dealing with Rowland's experimental work, either from the point of view of theory or results, is reprinted in full in this volume, with the exception of the figures in the *Tables* of Wave Lengths, copies of which Tables, however, accompany each volume. Not one word is omitted. The description of the methods by which these Tables are obtained is published in the volume. It may be that the reviewer is under the impression that the extracts from certain French scientific papers in regard to Professor Rowland's last determination of the Ohm are abstracts of published articles, whereas, in reality, Professor Rowland never published any description of the methods or results of this research.

In the second place, the reviewer refers to "some public addresses and other writings," thus implying, possibly, that there were other similar writings which were not included in the volume. In reality, *all* Professor Rowland's "addresses and other writings" are reprinted.

In the third place, those papers on purely mathematical subjects which are omitted from the volume, four in number, are in no case those which "most stirred Physical thought and upon which his place among those American physicists who since Rumford have influenced fundamental conceptions (if any such there be) must mostly depend." If the reviewer will look for one moment at the lists of the papers omitted, or, better still, if he will read the papers, he will see for himself why they were omitted. It should be noted, moreover, that every paper, mathematical or not, dealing with the fundamental conceptions of Physics, which Professor Rowland published, is, without exception, reprinted in this volume. Opinions may differ in the years to come as to the relative value of Rowland's contributions to science, but there can be no doubt that his thoughts and his experimental investigations in regard to the properties of heat, light, and electricity will always be of permanent value. Every paper published by Professor Rowland bearing in the remotest degree upon the above subjects is included in this volume.

It is a matter of regret that to any one the character of the publication of this volume should seem to have taken a "cheapish" form. It was the effort of the committee to give the volume such a character in respect to paper, type, illustrations, and binding that it would in every way be a fit memorial of their late colleague. As a matter of fact, the volume in its external appearance compares most favorably with the publications of the collected works of Lord Rayleigh, of Hopkinson, of Reynolds, and others which have recently appeared.

It is a pity that the reviewer did not see fit to call attention to certain features of the volume which will make it always useful to all students of physics—such as the publication of many papers which had been entirely lost sight of, and the detailed description of Rowland's wonderful ruling engine, the mechanism of which is here for the first time explained in print.

I am, sir, very truly yours.

J. S. AMES.

JOHNS HOPKINS UNIVERSITY, March 7, 1903.

[We have received from our contributor the following statement concerning this matter.—ED. NATION.]

"Professor Ames's letter convicts me of a grievous mistake of a complex nature. I received a copy of the volume with the request for a note upon it, and very unwisely accepted the commission when it was not in my power to make a sufficiently careful examination of it. The copy sent me was not accompanied by the wave-length determinations for which the name of Rowland is now uppermost; and two misapprehensions of mine, due to my well knowing his insistence on the publication of all details of experimentation, led me to think that these had been omitted in other cases. I had read Rowland's first mathematical memoir, which seemed to me to contain a striking enlargement of conceptions of electricity, and to place him in a higher rank of science than his experimental work. I was aware that there was some controversy in regard to its soundness; but there have been before mathematical works which proved upon examination to be unsound, yet which incontestably advanced human thought in no small measure. If it be true that Rowland's mathematical work is a total wreck and must be consigned to oblivion, I shall be very sorry as an American and as an admirer of the glories of the Johns Hopkins University. No doubt, Rowland will still remain a physicist of very high importance.

"As to the description of the famous ruling machine, I assumed that this gave the working drawings with explanation. If I had looked more carefully at them, I should have seen that this was not their character. It appears that they are new drawings, executed to scale for the purpose of this publication; and this sufficiently evidences the care that has been bestowed upon it. My epithet 'cheapish' marked my general dissatisfaction; but, with Professor Ames's explanation, it reduces itself to an expression of taste merely."

Notes.

Under the general editorship of Harry Roberts, a series of illustrated handbooks dealing practically with country life, and suitable for pocket or knapsack, will be published by John Lane, beginning with 'The Tramp's Handbook.' The same firm will issue 'New Letters and Memorials of Jane Welsh Carlyle,' edited by Sir James Crichten Browne.

Doubleday, Page & Co. will shortly issue 'How to Build and Furnish a Home,' by William L. Price and W. M. Johnson.

'The Gate Beautiful: Being Principles and Methods in Vital Art Education,' by Prof. John Ward Stimson, is announced by Albert Brandt, Trenton, N. J.

William E. D. Scott, Curator of Ornithology of Princeton University, tells of his "laboratory" of live birds in 'The Story of a Bird Lover,' to be published directly by the *Outlook* Co., together with a volume of 'British Portraits,' by Justin McCarthy.

Little, Brown & Co., Boston, will bring out this spring, in addition to a long line of fiction, a one-volume edition of the revised Nuttall's 'Popular Handbook of the Birds of the United States and Canada,' and 'Kennel Diseases,' by "Ashmont" (J. Frank Perry, M.D.).

'Civil War Times,' by Daniel Wait Howe (Indianapolis: The Bowen-Merrill Co.), consists mainly of the story of the author's experiences as captain of the Seventy-ninth Indiana Infantry, with a preliminary view of a three months' service as private in the West Virginia campaigns about Philippi. As a background for the operations of the regiment in the battles of Kentucky, Tennessee, and Georgia in 1862-3-4, some discussions are given of the notable leaders who passed across the stage, in rapid procession, in command of the armies of the Middle West; discussions which are judicious and temperate, and which aid in presenting to the reader who may not be familiar with more elaborate war histories, a measurably clear and just picture of the methods and faults of the powers at Washington and in the field, which protracted the war and cruelly wasted the national resources and enthusiasm. Some interesting columns of comparative statistics, compiled largely from the volumes of Cols. Fox and Livermore, constitute a chapter of the volume which may be studied with profit.

'The History of the First Tennessee Cav-

alry,' by W. R. Carter (Knoxville), is written in the customary style, popular and eulogistic, of the great throng of regimental memorials issued since the close of the civil war, which have helped to throw valuable light upon the spirit of the "uprising of the American people" and the rapid adaptation of men who, for the most part, were of a purely industrial and mercantile temper, to the exigencies of war. The people of East Tennessee, however, like most Southerners, did not find it hard to fit themselves to be soldiers, and, according to this historian, showed the extraordinary record of more than thirty-five thousand enlistments in the Union service out of a population, in 1861, of forty-five thousand adult males; to which should be added the volunteers for the Confederate army, leaving at home scarcely an able-bodied man. This regiment was raised by Robert Johnson, a son of President (then Senator) Andrew Johnson, who soon surrendered his leadership to James P. Brownlow, a son of the then famous "Parson" Brownlow, of perfervid Southern rhetoric in his newspaper, which bore a distinguished part at the outset of the war in keeping his mountain country loyal to the Union. Much of the regiment's activity was on its own native soil, first under Morgan in seizing Cumberland Gap at a time when small victories fired the national heart, and later under Burnside in resisting Longstreet. It was also an honorable participant in the campaigns of middle Tennessee and Georgia, including Stone River, Chickamauga, the Atlanta campaign, and the destruction of Hood's army at Nashville.

'A Virginia Girl in the Civil War' (D. Appleton & Co.), edited by Myrta Lockett Avary, consists of some dramatic experiences of the girlish wife of a Confederate cavalry officer, mostly in and around Richmond. The story has many characteristic Southern superlatives, and here and there it would appear that accuracy had not been permitted to spoil a good story or an effective situation. But, altogether, the volume is a readable contribution to war history, and, moreover, is in an entirely "reconstructed" temper. This wife at seventeen years was compelled, from the outset of her married life, to share the terrors of war alike in the active participation of her husband in the campaigns of the Army of Virginia and in her own residence in the midst of siege and hospital. Her home at Petersburg received some of the first bolts of the besieging cannonade of 1864, and, with her non-combatant neighbors, she fled from house to house out of gunshot until driven to Richmond. Several times she visited her husband at the front and helped keep up the amenities of civilization, in winter quarters, for a group of cavalry generals, among them Stuart and W. H. F. Lee. She ran the blockade as far as Baltimore by crossing the river at Berlin on the Potomac, and returned after sundry hair-breadth escapes, in which gallant and kind-hearted Union officers, upon whom she lavishes praise, helped to smooth the difficulties; and the additional supplies thus smuggled into the poverty-stricken Confederacy were not of the sort to accuse these soft-hearted helpers of undue assistance in supplying the enemy, for the most valuable of her Northern purchases was a uniform for her ragged husband, which she and her companion had had made up into petticoats.

A new, enlarged, and (probably) final edition of Conan Doyle's 'The Great Boer War' (McClure, Phillips & Co.) adds eight chapters to the narrative which was reviewed in these columns two years ago. The size of the page and of the maps has been increased, and the details of the guerilla operations which followed the escape of President Kruger to Europe and the return to England of Lord Roberts in the autumn of 1900, have been described with as much of the spirit of the earlier history as can be put into an account of operations so fragmentary and so hopeless of changing the result as were the guerilla actions of the next year. Our former favorable estimate of the book is confirmed in the light of the many volumes which have been printed upon these campaigns before and since this work. It always endeavors to be fair, its criticisms are well put, its proportioning of praise and blame to both antagonists is as judicial as could be expected from the inevitable bias of an author who is speaking for his countrymen, and it derives a vigorous and picturesque style from the well-known literary art of the novelist.

The first of two volumes of the correspondence of the Colonial Governors of Rhode Island, 1723-1775, published by the National Society of the Colonial Dames of America in the State of Rhode Island and Providence Plantations, edited by Gertrude Selwyn Kimball, has appeared from the press of Houghton, Mifflin & Co. The material is taken principally from manuscripts in the Rhode Island archives; a few of the originals are in the John Carter Brown Library, and a few in the Rhode Island Historical Society Library. With rare exceptions, the letters (both to and from the Governors, together with enclosed documents) are now published for the first time. The spelling and punctuation of the originals have been followed. The first volume of 434 pages, which brings the correspondence down to 1746, contains some 250 letters and documents. About one-half of them deal wholly or mainly with military matters; about fifty with boundary disputes; about forty with currency legislation; about twenty with the Sugar Act and the customs. Other matters touched on are the negative, salary, elections, manufactures, the Draper outrage, colonial laws, impressment, and the Albany conference of 1744. The arrangement is chronological. The notes, which are comparatively few and to the point, together with the introduction of forty pages, give precisely the sort of supplementary aid one would most wish to have. Five illustrations accompany the text. The work was worth doing, and has been well done. It is to be hoped that the concluding volume will contain a careful topical index.

'Side-Lights on the Georgian Period,' by George Paston (E. P. Dutton & Co.), is a collection of magazine articles that have previously appeared in the *Monthly Review*. The first, "A Burney Friendship," contains some hitherto unpublished letters of Fanny Burney's written before and after her marriage—letters that show her in no very amiable light. "London through French Eyeglasses" is an account of the experiences of a French tourist in the London of the middle of the 18th century. In his description of the gaming clubs, M. Grosley writes: "A Minister of State had recently passed twenty-four hours at a gaming-table, so absorbed in play that during the whole time he took no sustenance, except a bit of beef between two slices of toasted bread. This dish grew highly in vogue during my stay in London; it was called by the name of the Minister who invented it." Thus may one date the appearance of the sandwich. "An American in England" is a series of extracts from George Ticknor's account of his English experiences, and contains nothing that is new to his readers on this side of the Atlantic. In the article on "The Ideal Woman," Sydney Smith's saying is quoted that no woman would desert her infant for a quadratic section. There is no such thing as a quadratic section, so it would indeed be unlikely. For "section" read "equation" (p. 97). A less important slip is the spelling of Jack Sheppard's name on page 115, where it is given as "Shepherd." The book as a whole is hardly worth its excellent get-up. Written for a magazine, the articles have the magazine stamp, and might have remained in the seclusion of back numbers.

Sudermann's "Es lebe das Leben," which Mrs. Campbell has made familiar to our theatre audiences under the name of "The Joy of Living," has been brought out, under the same title, in a remarkably good translation by Edith Wharton (Scribners). The cleverness of construction, the raciness of dialogue, the up-to-dateness of thought, which distinguish this latest production of Sudermann's, come out perhaps more strongly still in its book form than on the stage; and so do its utter artificiality and lack of genuine feeling.

There is something pathetic in the earnestness displayed by Judge Max Eberhardt of Chicago in the attempt to maintain German sentiment, if not sentimentality, in the midst of practical, hustling American life. His 'Gedichte' (Chicago: Koelling & Klappenbach) reveal a kindly, sincere, high-minded type of character. From the point of view of technique, they are clearly amateurish.

Of the great Colonial Atlas, published by the German Government and edited by Paul Sprigarde and Max Moisel, the first number, on the Cameroons, appeared a year ago, and a second part has now been sent out covering all the German possessions in the Pacific Ocean and in China. This part contains six sheets, two covering German Guinea, on the scale of 1:2,000,000, and the others the remaining German territory on the scale of 1:3,000,000. The mechanical work has been done by the Reimer Chartographic Institute, in a model manner. The progress in our knowledge of these lands can best be seen by a comparison of the new charts with the Langhans Colonial Atlas. The third and concluding part of the Atlas is promised for the coming spring. The price of each part is only 3 marks.

The latest part issued of the 'Thesaurus Linguæ Latinæ' is the ninth. It is announced that this great work has 1600 subscribers, scattered over the whole civilized world. It is appearing somewhat more slowly than was expected, but both its contents and form reflect honor on the sponsors of the undertaking, the German and the Vienna Academies of Sciences, and on its editor, Professor Vollmer of Munich, as also on the Teubner publication house. Of

the first volume, which is to contain the letter A down to *an* (exclusive), 1,184 columns of 84 lines each have been printed, bringing it down to the unfinished article *affectuosus*. Of the second volume, beginning with *an*, 960 columns have appeared, closing at present with *asstringo*. The preposition *ad* extends from column 472 to 559, and will probably yet be surpassed by the article *in*.

On January 23 the Munich *Fliegende Blätter*, founded in 1843 by Kaspar Braun and Friedrich Schneider, and still published by their heirs, issued its three-thousandth number. This weekly journal not only is an exceedingly original organ of wit and humor, but also has a certain historical character, inasmuch as it affords an interesting survey of the evolution of the arts of design in Germany, and especially in Bavaria, during the last sixty years. With it are associated for more than two generations the names of celebrated painters, from Moritz von Schwind and Karl Spitzweg to E. Harburger, H. Stockmann, and Franz Simm, all three of whom furnish capital drawings for the festive number. Not less illustrious are the poets who have contributed to the text, and of whom we may mention Emanuel Geibel, Karl Stieler, Friedrich Bodenstedt, Wilhelm Hertz, Rosegger, Martin Greif, and Hermann Ling. It is no wonder that from such artistic and literary sources the stream should always flow fresh and full in the columns of the *Fliegende Blätter*, and its contents be distinguished for their charm and endless variety.

The nearly six hundred pages of the sixth volume of the Publications of the Mississippi Historical Society (Oxford, Miss.) testify to the new activity of this organization. The principal article in point of bulk is that on Suffrage and Reconstruction in the State, by the Hon. Frank Johnston, who fills one hundred pages. Next in measure comes the first annual report of the Director of Archives and History. It includes the nominations by popular vote of candidates for the Hall of Fame with which the new State Capitol is to be provided for portraits and statuary. As was to be expected, Jefferson Davis (14,452) leads the list, followed, however, closely by L. Q. C. Lamar, and two others whose admirers exceeded 14,000. Next after these (13,008) ranges S. S. Prentiss, which is a little surprising, and near him "Hangman" Foote. There is a decided slump with William Barksdale, Albert G. Brown; the Mexican war hero, Quitman; Robert J. Walker, etc. Portraits of many of these are in readiness for the hall, as well as of some not remembered by the voters.

The "John Brown letters" are continued in the January number of the *Virginia Magazine of History and Biography*, and scarcely rise above the level of what has previously been published. There is much good anti-slavery sentiment printed for the first time and "exclusively" in a once slave State. Some of it is naturally endorsed "Improper." The lists of Brown's associates "as furnished me [Andrew Hunter] by Brown and Stephens" is defective; again naturally, in view of those who had escaped. A United States Marshal in Cleveland expresses his fear lest Brown's praise of his jailer's humanity cover a design of jail-breaking. Those in charge of the Harper's Ferry prisoners should be "proof against flattery and as true as steel." There is a facsimile of two autographs by an early Governor of Virginia, Sir George Yeardley, accompanying some particulars about him and transcripts of letters among the Ferrar Papers at Magdalene College, Cambridge. A searching review of Curtis's 'True Thomas Jefferson' concludes the issue.

For the same number, Mr. Edward Wilson James transcribes a list of slave owners in Westmoreland County, Va., in 1782, showing an average of about eleven slaves to each owner. "S. indicates slaves, and W. wheels of vehicles," reads the legend. In his own periodical, the *Lower Norfolk County (Va.) Antiquary*, Mr. James has a similar list for Princess Anne County in 1780, in which slaves and riding chairs are conjoined, the average number of slaves being four; another for 1860, when the average was about seven, but the record is mutilated. As late as 1859 there was a census of watches, which seem to have been mysteriously abundant.

The Canadian Boundary is the timely subject of the opening article, by Mr. John W. Foster, in the March number of the *National Geographic Magazine*. It is a brief historical review of the three courses of action, treaty adjustment, joint and equal commissions, and arbitration, by which the line has been adjusted and marked. From this it appears that "we have suffered less, in loss of territory claimed, by the action of joint commissions and by arbitration than by treaty settlement." Other articles are on the mountains of Unimak Island, Alaska, and on the development of Alaskan transportation facilities, both of which are illustrated. In view of the fact that the extension of a quarry in Genoa, Italy, necessitates the removal from his grave of the body of James Smithson, the eminently fitting suggestion is made that a permanent resting-place for his remains should be provided in the grounds of the Institution which he founded.

The progress of India under English rule is indicated by a report on its railways by our Consul-General at Calcutta, published in Consular Reports for February. There are now in operation about 26,000 miles of roads, and the revenue from them in 1901 amounted in round numbers to one hundred million dollars. As there was a surplus over running expenses of more than three million dollars, they may now be regarded as having ceased to be a burden to the state. Our consul at Harput tells of the introduction of a reaper in his district by a graduate of an American agricultural college, and the opposition which it caused among the laboring population. "His garden of American vegetables was destroyed, his fruit trees were cut down, shots were fired at his house during the night time, and his workmen were induced to desert him. In spite of all these discouragements, the experiment was pluckily continued to the close of the season. Another year will see the more widespread use of the reaper and the introduction of the thrashing machine." The German briquette industry is described by Consul-General Mason in an illustrated report, in which he states that a "Syndicate of Briquette Machinery Manufacturers" has been formed "to meet promptly and efficiently the American demand for machinery and working methods."

After repeated and vexatious delays, caused largely by a learned squabble among Italian historians, the great International Historical Congress has been called to meet in Easter week in Rome. The Government announces that for the period of two months, between March 1 and May 1, the members of the Congress, by merely presenting their membership cards, will be permitted to work at pleasure in any of the Italian state archives and libraries. King Victor Emmanuel has accepted the position of Honorary President of the Congress.

It has been practically decided that the great International Archæological Congress, which had been called to meet in Athens some time during the present year, will be postponed for at least twelve months. The Greek Archæological Society, which has the whole matter in charge, has come to the conclusion that the preparations for the convention will require more time, as these include such important undertakings as the restoration of the temple at Phigalia, of the Lion of Chæronea, of the Erechtheum, as also the renovation of the temple district of the Olympian Jupiter in Athens, and the completion of the diggings begun in Samos and several other localities. Some of these projects may consume even two years, and the president-elect of the Congress, Crown Prince Constantine, is to decide upon the exact date of the meeting.

—Quite the most significant paper in the *Harvard Graduates' Magazine* for March is that of Professor Hollis on Football. We shall say little more of it than that its weight comes from his moderation in censure; but we ask any reader of it to sum up the items of his "when all is said against football," and ask whether it is offset by his "much in its favor." Are not the moral evils as he presents them—"just enough of the prize fight in it to lay it open to suspicion," "the absence of chivalrous conduct," "it is customary to weaken an opponent by bruises or otherwise," dishonest selection of teams—visible and ponderable, while the teaching of "some of the manly virtues admirably," and exercising a moral restraint against drifting into dissipation, are in comparison imponderable? So they must seem to any one who takes into account also the gambling on the issue of the game, the usual rowdyism of the victors, the excesses encouraged by great crowds of youth being transported to strange cities beyond surveillance. Moreover, the evils acknowledged by Professor Hollis are sustained by a corrupt public opinion in the student body and are contagious—the public opinion, to speak plainly, of the mob of men of unformed principle. The dissipation of non-athletic days had, no doubt, its victims by contagion, but it never was condoned by the moral sentiment of the good; it never became respectable, or the thing. If, then, there has been an actual lowering of tone in the college world, can it be that the manly virtues have been strengthened in the mass? Some light is thrown on this inquiry by the discussion of "Seminars" in the same number of the magazine.

—Two volumes of the Ecclesiastical Records of the State of New York (pp. 1,442) have been published by the State at Albany, reproducing in English what has generally been known as "The Amsterdam Correspondence," from 1621 to 1701. They

comprise letters from clergymen and other Dutch gentlemen, and various persons in New Netherland, who wrote back to the old country concerning things ecclesiastical, political, economic, and social in the New World. The translations are printed in chronological order, with notes and explanations by the Rev. E. T. Corwin, D.D., the historian of the Reformed Church in America, with additions and comments by Mr. Hugh Hastings, State Historian. The existence and value of these documents have long been known to students of the Dutch origin of American history, but it is only within the past decade, through the liberality of some gentlemen in New York, that Dr. Corwin was sent to Holland, spending many months there in making critical examination and collation, and securing transcripts. The translation had been largely made by the late Dr. Daniel Van Pelt, whose lamented death by drowning was a sad loss to American scholarship in Dutch, in knowledge of which language most of our historiographers are disgracefully deficient. It is now being continued under Dr. Corwin's supervision by the Rev. Henry Utterwick.

—It is difficult to realize the great work done by the Classis of Amsterdam in the settling of the Middle States with industrious and intelligent people of good moral character. This association of ministers of the Reformed Church in the Netherlands had charge not only of the cosmopolitan community that had gathered in the Dutch republic, where conscience was free, and thence emigrated, but also over nearly all colonists from the Continent to America. Coming down the rivers Maas and Rhine from the heart of Europe, they took ship at Rotterdam or Amsterdam, and had often to be assisted with money, food, and clothing. Until early in the past century, both the Germans and the Dutch of the Reformed Communion in America were under the direction of the Classis of Amsterdam. Thus, in the present publication and the two volumes to come, we have records of general public interest. One who reads these documents (especially if he ignores the annotation and comment of twentieth-century Americans) with knowledge of the background of Dutch history out of which they grew, gets an idea of New Netherland curiously different from either the Washington-Irving sort, or the after-dinner speeches at the Holland Society gatherings. One sees that, beside the rough sailors and traders from many lands gathered in a cosmopolitan seaport, the snarling and incompetent officials dressed in a little brief authority, and clergymen more anxious for orthodoxy and personal comfort than for close imitation of their Master, there was, in the valleys of the Hudson, Mohawk, and Raritan, a solid core of diligent, God-fearing, and moral people. These latter, for the most part, remained after the floating elements of the population returned to Holland on account of the English conquest of 1664. The learning and culture of the university-bred dominie are evident. Though others may make a similar claim, yet the facts seem to show that the first ordination of a Protestant clergyman in North America was that (on October 9, 1679) of the Rev. Petrus Tesschenmacker, who, in 1690, when pastor at Schenectady, was killed in the massacre by the French and Indians. The event gave rise to much correspondence, not only for political reasons, New York being then under the English Governor Andros, but because the candidate was a follower of Voet, the conservative, while the three examining ministers were of the school of Coccejus, since recognized as "the father" of biblical or modern theology. Very practical is the recommendation in 1701 that ministers living among the Indians should have, "besides other qualifications, a little skill also in physick and chirurgery." Evidences of the intense jealousy and vigilance of the Dutch clergy and people in resisting the attempted encroachments of the Anglican state church, and in maintenance of their freedom of conscience and the forms of the Reformed Church, are found on many pages. It is hard to see how any one professing to write on the early history of the Empire State can ignore these volumes.

—The sixth volume, last but one, of the Variorum Edition of the Writings of Edward FitzGerald (Doubleday, Page & Co.) contains the 'Œdipus,' the 'Bird-Parliament,' and the 'Suffolk Sea-Phrases' with related communications to *East Anglian* and *Notes and Queries*. These etymological diversions form part of the distinction of Mr. Bentham's collection, and it is a pity that he is debarred from joining with them the Letters, which are "now and again" (to use a Suffolk phrase) illuminated by similar glosses. The same humor vivifies both. Here is the chapter on "*Complain:* A ship or boat begins to *complain* when her nails, seams, or timbers begin to give way. Almost as good a phrase," adds FitzGerald with a wink, "as 'beginning to show symptoms of deterioration,' etc." And again: "*Burn:* 'How the sea burn!' what you now hear children talk of as 'being in a state of phosphorescence.' Which is best?" Of "*Poker Beer:* Beer heated with a red-hot poker; about a pint to a poker, I am told. There are worse things, and, as Lamb said, better." Here one comes upon another definition of *smell the ground*, so often recurring in the Letters of FitzGerald's later years. And here is his "Michael-Angelo-made fellow," "Posh," who ranks in the Letters beside Thackeray and Tennyson for greatness, but who had a seaman's distrust of hoofed animals, assuring his partner in the lugger *Meum and Tuum* that "he didn't mind a cow, but 'wasn't by no means *wrapt up* in a bullock.'" As in previous volumes, we have MS. interlineations and corrections upon the printed copy; for instance, on page 9, where, by the way—and hardly by the way in such beautiful letterpress—would not FitzGerald with some impatience have applied his pencil to this mammocking of his preface to the 'Œdipus' in line two—"banishment will be sufficient accomplished by the Oracle" (read, "accomplishment of")?

—The first two volumes of the handsome reunion of Mr. Aldis Wright's several editions of Edward FitzGerald's Writings (Macmillan) were ornamented with portraits of the author. Towards the close of the second volume, the letters to Fanny Kemble began to make their appearance, and the third volume appropriately has her portrait for frontispiece, after Sully's painting. We again get nothing but the Letters in the text, in that period when failing eyesight and other symptoms of the end still considerably deferred led the recluse to put his literary house in order, look over his old letters, and place in good hands such as had historic value—doubtless also to destroy much. His literary executor in his turn had to spare the feelings of the living, and many blanks reveal Mr. Wright's forbearance in this regard. Occasionally they may denote simple repetition which was not worth while; but then, again, repetition abounds in the treatment of the same topic for different correspondents, and such is the variety of angle thus afforded that the visual effect is truly stereoscopic. Herein is revealed the immense gain of the chronological order. We could wish that the editor had been willing to bestow a little more pains in reordering the footnotes. That on page 40 was to be looked for on page 38; that about Carlyle's niece on page 193 on page 191; so, that about Pasta on page 130 comes late. This care was merited by a body of letters which must ever rank among the highest. Always chary in his praise of female genius, FitzGerald singles out Mrs. Trench's letters as excellent—"so far as I can see and judge, next best to Walpole and Cowper in our Language." And it is noticeable what delight he took at the last in Mme. de Sévigné's, read between Scott and Cervantes.

—Prof. Chauvin's treatment of the 'Arabian Nights,' in his 'Bibliographie des Ouvrages Arabes,' is extending beyond ordinary bibliographical limits, and is becoming a thesaurus of folk-lore of primary importance. The first part, previously noticed, contains the strict bibliographical element; the second and third parts contain résumés, often very full, of the tales embodied in the different recensions—MSS., original texts, translations—or in the companion and related collections. At least another part will be needed to complete the work. The résumés are arranged in the alphabetical order of some leading word in the title; each is preceded by a statement of the MSS. in which the tale occurs, of the printed texts, of the translations, and of the parallel tales existing elsewhere and not borrowed from the 'Nights.' After each comes a bibliography—wonderfully full—of references to that tale, literary use of it in Europe, and, above all, to its place in folk-lore. This last is, perhaps, the outstanding feature of the book, and is especially rich on the Oriental side. The width and accuracy of Prof. Chauvin's reading cannot be too highly praised; he is doing more towards the elucidation of the 'Nights' than any one since Zotenberg's epoch-marking book.

—The following corrections and additions suggest themselves: In Part ii., page 67, the relation of "Aladdin" to the German *Volksbuch*, "Das Schloss in der Höhle Xa Xa," should be examined more carefully; it is very close, by no means *éloigné*, and suggests that the story reached Germany through Italy. Page 201, Prof. Chauvin apparently has not noticed that the story of the third Calender is complete in the Calcutta text; we are not thrown back upon Galland for it. Page 220 ("The Money-changer of Baghdad"), there should have been a reference to the article on Ibn al-Ahnaf and his fortunate verses by Prof. C. C. Torrey, in the *Journal of the American Oriental Society*, volume xvi.;

it is a very significant study of the origin of a minor tale. Page 231, "Ed. Poë" will hardly suggest Edgar Allan Poe. Page 256, the story of the fate of the Queen of Serpents, and of the use made of her body, is very remarkably paralleled in J. G. Campbell's 'Superstitions of the Highlands of Scotland' (p. 224). Part iii., page 48, it is rather singular, seeing that Prof. Chauvin has made some studies in Muslim theology and jurisprudence, that he should question the extent to which tales of the Jinn were believed in the days of Harun ar-Rashid. Harun would have been an unbeliever in Islam itself if he had doubted the existence of these beings and the possibility of intercourse between them and mankind. Books of law to this day take account of their rights and duties. Page 68, story 234 touches the European legend of the ring of Venus and the midnight procession of Pluto. An Arabic parallel which Prof. Chauvin has missed is in ad-Damiri's "Hayat al-haywan" (i., pp. 185 f. of the edition of Cairo, 1313). There the great Sufi saint Abd al-Qadir al-Jilani acts as the magician, and gives to a father, whose daughter has been mysteriously carried off, a letter to the Sultan of the Jinn. The father waits for the procession from nightfall on among the mounds in the ruined part of the quarter of Baghdad called al-Karkh; at dawn the Sultan of the Jinn passes. Again J. G. Campbell, in his 'Witchcraft and Second Sight' (p. 200), gives a curious parallel from the West Highlands of Scotland with Michael Scott as magician. Page 91, on the story of the treasure of Toledo, Prof. Chauvin does not mention what is probably its most important echo in European literature, Scott's 'Vision of Don Roderick.' It is to be hoped that the final part of this bibliography will soon appear, and with it full indices and exact references to the books used. "Kunos, Turkish Tales," for example, is very blind; it appears to refer to an English form of the tales published first in Hungarian and then in German in the *Ungarische Revue*, 1888-89. So monumental a work as this deserves to be rounded to full completion.

DRUMMOND'S MARTINEAU.

The Life and Letters of James Martineau, LL.D., S.T.D., etc. By James Drummond, M.A., LL.D. And a Survey of his Philosophical Work, by C. B. Upton, B.A., B.Sc. With portraits. In two volumes. Dodd, Mead & Co.

There is little good or bad in this work of 979 pages but thinking makes it so. We mean by this that even the biographical part, which exhausts the first volume and extends far into the second, is hardly less a study of Martineau's thought than the part (vol. ii., pp. 255-483) which is devoted expressly to an analysis of his intellectual activity. Mr. Jackson's recent 'Study and Biography' of Martineau was blamed for its lack of biographical interest, and it was plain enough that he had a better gift for exhibiting Martineau's ideas than for telling the story of his life; but it is now equally plain that the fault was more in his material than in his presentation. Dr. Drummond's talent for biographical writing is not remarkable, and it is conceivable that another might have done better with the sources at his command, but he has had the same difficulty to contend with that Mr. Jackson had—the defect of Martineau's life on the side of personal interest apart from its intellectual expression. These volumes are, indeed, rich in letters where Mr. Jackson's 'Study' made no attempt to furnish any, but it must be confessed that these letters do not make us much better or more pleasantly acquainted with the man than do his various books. Even when most personal, they tend to become sermons or essays, not only in their manner, but in their length. Martineau wrote a great many letters, and there is something beautiful and touching in the conscientiousness of his discharge of his epistolary obligations; but, for letter-writing as a peculiar literary species having many excellent varieties, he had as little faculty as Tennyson, whose weakness at this point was as conspicuous as FitzGerald's strength. Long letters may be good letters, but Martineau's are not merely long: they are elaborate disquisitions, devoid of humor, ease, and playfulness, and of those unconsidered trifles which go far to make one's letters live when the writer has forever laid aside his pen. Even those written to persons in deep sorrow, to which Dr. Drummond has a noticeable gravitation, are as much too labored as they are too long. A hand-clasp in ten words would have better served his end.

Martineau's life, as presented in these pages, impresses us as never before with its intensive quality. A corresponding extensive quality he did not possess. Where he was most at home, his range was less remarkable than his penetration; the absence of Hegel from his 'Types of Ethical Theory' being a notable case in point. It is significant that in 1878, when FitzGerald's translation was a matter of twenty years' standing and several editions, Martineau writes to Dr. Furness, answering his enthusiastic commendation of Omar Khayyám, that he has no knowledge of him. The same letter proves that if he was less ignorant than Spencer of Indian philosophy, he was not less indifferent to it. "The study of it," he says, "is mere taskwork to me." These instances are typical. He might be indifferent to Indian philosophy, but his was the absorption of an Indian yogi in his favorite studies and his chosen line of philosophical and religious exposition. His affections were not literary, except as they required of him a manner of writing which was more remarkable for its brilliancy than for its luminosity, and which often has a vertiginous effect upon the reader who should be at his best to follow his teacher through those mazes where he leads the way. Because of this limitation on the literary side, we have here no wealth of allusion to all sorts and conditions of books and authors. For another lack, we are quite sure that the biographer is more to blame than Martineau himself—the lack of vital apprehension on Martineau's part of the social and political interests of his time. We are very certain that we have here defective representation, and also that the turbid stream of general theological controversy must have left more silt upon the surface of his mind than is here made apparent.

With so little to vary the even tenor of Martineau's course of life, we are in danger of making too much of the little that was episodical, and especially of the unfortunate rupture in the affectionate relations which for a long time existed between Martineau and his sister Harriet. There is loyal defence of their mother from the aspersions of a certain biographer of Harriet (Mrs. Fenwick Miller), which were much sharper than her own; and, indeed, it is out of Harriet's own mouth that her biographer is sufficiently condemned. But we cannot imagine why Dr. Drummond did not print entire Martineau's letter to the *Daily News* in 1885 touching this matter and that of the unhappy estrangement of the brother and sister. Of this estrangement we have Martineau's own account and Dr. Drummond's comment, which, wherever it touches the relations of James Martineau and Harriet, is as considerate as possible, yet not without some lack of apprehension and of representation. It is made plain that the estrangement originated in circumstances far back of Martineau's review of the Atkinson 'Letters,' in his refusal to return to Harriet letters that she had written him through the course of many years. He told her that if he "must choose between unknown future communications and the inestimable treasures of the past, his decision must be to keep what he had," etc. Dr. Drummond's appreciation of the quality of this decision, as well as Martineau's, appears to us to be greatly wanting. It was certainly a strange resolve of brotherly affection that preferred a future of non-intercourse (Harriet's terms) to the surrender of a package of old letters. As for Martineau's review of the Atkinson book, Dr Drummond's condonation of it is far more sensitive to its shortcomings than Martineau's. He calls it scathing, and says: "No impartial reader can wonder that Miss Martineau was pained." Martineau wrote, "In one sentence only is my sister mentioned." But he resembled his sister strongly in having a memory that played him tricks. (He had a vivid recollection of Theodore Parker's preaching, which he had never heard!) Dr. Drummond explains that there were four references to Harriet in the review, but the one which Martineau remembered was quite enough—a lion with the sharpest claws; and Dr. Drummond should have given it for the assistance of the judgment of the less informed. Moreover, Martineau's account of the circumstances which led to his undertaking the review was not confirmed by that of the other editors, and certainly he should not have permitted any urgency on their part to force him into the assumption of a task so manifestly ungracious and so sure to carry painful consequences in its train.

Another episode, which assumes greater prominence because of the general level of uneventfulness from which it springs, is that relating to Martineau's election to his professorship in Manchester New College in spite of violent opposition. Martineau's later prominence was so much that of a defender of certain traditional conceptions in religion against the radicalism of science, that it is rather difficult for a younger generation to appreciate the fact that, midway of the century, he was regarded by his Unitarian brethren for the most part as a very dangerous heretic. It was in this character that his election to the professorship of Manchester New College, a Unitarian theological seminary, was op-

posed. It is interesting to notice that when, much further on, he was an unsuccessful candidate for a philosophical chair in London University, the opposition came from those who had arrived at philosophical constructions more radical than his own, Grote the historian heading it; and even John Stuart Mill, who at once recognized Martineau's ability and was friendly to his person, "could not miss the opportunity of planting a disciple of his own school in a place of influence." The Archbishop of York objected that Martineau did not believe in the doctrine of the Trinity. Martineau wrote, "In this spectacle, of Mr. Mill and the Archbishop moving hand in hand, under the common guidance of a sectarian motive, there is a curious irony."

There was more curious irony in Grote's objection to Martineau as the minister of a religious sect, seeing that Martineau's endeavor to free himself from any sectarian implication was the most persistent endeavor of his life. Lessing said that he should hate truth itself if it could form a sect, and Martineau could heartily concur. It was this aspect of his life that involved him in more misunderstanding than any other, much of which cannot but appear to have been wilful blindness. Much has been said to the effect that he was not a Unitarian, as if this signified a preference for more orthodox ideas. The whole tenor of these volumes, and hundreds of special statements in the course of them, should so set this matter right that only the most stupid need ever doubt again as to his actual position. He was a Unitarian in his personal theology, but he did not believe in any doctrinal test or bond of fellowship whatever. It was not as more orthodox, but as less orthodox, than his Unitarian brethren that he objected to their creed and became to them an object of suspicion. But any creed was to him an impossible basis of religious fellowship. He was curiously sensitive to the technical meaning of the word Unitarian, and insensitive to its historical associations. It was as if his exigency here exhausted all his store, for on other lines he had little difficulty in giving an expansive meaning to old words. He did not, for example, believe that Jesus thought himself to be the Christ, yet he used the word Christ without hesitation, and, with surprising violence to his undogmatic ideal of church fellowship, wrote that he could not find any adequate church fellowship in a religious society which discarded it. For most of us the connotations of a word are so much more vital and important than its mere denotation, that it is hard for us to imagine Martineau preferring the name Presbyterian for his ideal religious organization.

But the events of Martineau's life were his sermons and his essays and his books, and to these, in their due order and progression, Dr. Drummond has attended in a careful and instructive manner, sometimes embarrassed by the consciousness that Dr. Upton is to follow up the biography with a "Survey of Dr. Martineau's Philosophical Work." If there is any defect in this noble and exhaustive presentation, it is that the emphasis rests unduly upon Martineau's writing over and above his Liverpool and London sermons. Dr. Drummond does not seem to share in the impression of R. H. Hutton that Martineau's sermons are the works by which he will be longest named and known. Not that he has for them any hesitating or doubtful commendation, but it was inevitable that the bias of his own professorship should be favorable to Martineau's philosophical preëminence. It is interesting to find Dr. Drummond frankly demurring at Martineau's ideal sermon as a lyrical expression overheard. Martineau could not conceive of the generation of the thoughts and aspirations of a true sermon except in solitude. Dr. Drummond contends that the best thoughts are often kindled by the preacher's contact with his congregation. But it is quite impossible to imagine those subtile nuances which gave to Martineau's sermons their characteristic force and beauty as produced in any mood but that of brooding solitude. The wonder is that he could publicly repeat the thoughts which visited his solemn privacy.

There are many aspects of these volumes which invite attention, but to dwell on them would make this review too long. The characterizations of different men, Carlyle, Jowett, Parker, Emerson, and so on, are clear and fine. Martineau was much troubled by Emerson's lack of continuity. Writing of Thomas Hill Green's "curious type of vague or semi-theism," he uses one of those splendid metaphors into which his thought so easily ran, and which are for some the glory of his style, for others its despair: "It is either the last faint streak of a dissolving nebula, or the first visible undulation of an ethereal medium that must condense into a central sun." Of the various groups of letters, the most interesting are those to R. H. Hutton, who transferred his theological allegiance from Martineau to Maurice; and those to Francis W. Newman, who marvels at Martineau's sympathetic appreciation of John Henry Newman's mind. No difference of opinion could be more trying to Martineau's sensibility than F. W. Newman's, with its impeachment of the moral perfection of Jesus; but the toughness of his friendship bore even this fearful strain. He recognized that he and Newman reverenced the same ideals, and differed only as to whether those ideals were or were not embodied in the character of an historic person.

The American reader whose memory goes back to the great war will regret that Martineau's correspondence falls silent on its threshold. We should have had here his letters to Dr. Furness and Dr. J. H. Allen, with their careful explanations of his lack of sympathy with the North in its great struggle, the more remarkable as he had clearly apprehended the merits of the struggle in its earlier stages. It is interesting to find Dr. Dewey, in 1844, applauding Martineau's refusal to sign the English anti-slavery address to the American Unitarians. But Dr. Dewey's applause was resented:

> "My dear Dewey, what business have you among the ranks of those who have nothing but dollars and doubts to plead against the primary claims of Nature and the Human Soul? . . . Channing began with objecting to the Abolitionists; so did Emerson; so did you. The future age will reckon all three among the most powerful agents of Emancipation—will it not?"

This seems to invite Dr. Dewey to become an Abolitionist, but in a subsequent letter Martineau writes that he never wished him to become one. Was the previous outburst a mere flourish of rhetoric? He cannot, however, see any logic in Dr. Dewey's opposition to the annexation of Texas, together with his denial of responsibility for the existence of slavery in the Southern States.

There are many expressions of Martineau's opinion touching vital matters that must be dismissed without a word. And it is impossible in this space to give any adequate idea of his theological development from a crude supernaturalism to a religion of personal conviction, or of his often disappointed, steadily renewed, endeavor to realize an organization of religion in which the freedom of the spirit should be superior to all dogmatic tests.

Dr. Upton's "Survey of Dr. Martineau's Philosophical Work" is a book by itself deserving separate treatment. To those whose interest in Martineau is mainly philosophical, it will address itself as more important than Dr. Drummond's biography. Remembering some unhandsome English criticisms of Mr. Jackson's 'Study,' it is confirmatory of our good opinion of that book that Dr. Upton frequently refers to it and quotes it in terms of high respect. Than Dr. Upton no one could be better fitted for the task which he has faithfully performed. He was first Dr. Martineau's pupil, then on his teaching staff for ten years, and for twenty years he went annually to spend two or three weeks of his vacation with Martineau in his Highland home, matching sometimes the mountain climb with a more steep ascent of speculative thought. His appreciation of Martineau's system is as perfect as this ample acquaintance with him would lead us to expect. It consists of nine chapters, the first of which deals with Martineau's early adhesion to Hartley on materialistic and necessarian lines. Many have wondered that Martineau's "Priestley," preserved in his 'Essays,' shows so little sign of his early sympathy with Priestley's opinions. Here they may learn that the early study has been changed from time to time to meet the exigencies of Martineau's changing thought, losing in this way its character as representative of Martineau's early mind. The successive chapters treat of Martineau's lectures in Manchester New College, his early reviews, his mature period of study in Germany, his 'Essays, Reviews, and Addresses,' his part in the Metaphysical Society, his 'Types of Ethical Theory,' his 'Study of Religion,' and his 'Study of Spinoza.' Under the last head we have Dr. Upton's criticism of Martineau's treatment of pantheism and determinism.

Dr. Upton's criticism of Martineau's opinions is the more interesting because he now and then parts company with him. He cannot, for instance, accept his ideas of space and matter as "data objective to God." One sometimes hears that Martineau outgrew these conceptions, but Dr. Upton does not confirm the rumor. He finds Martineau more nearly in agreement with Lotze than with any other philosopher, and he clearly indicates their approximations, and forecasts the philosophy of the near future as one that shall blend their systems in a convincing unity. There is something very inspiring in his account of Martineau's system, as there is in Dr. Drummond's story of Martineau's consecration of his life to its elaboration and defence. What it made for was the stable equilibrium of God, Matter, and Man, neith-

er swallowing up the other, in the fashion of pantheism, materialism, or idealism, and above all for the freedom of man's will in opposition to the necessarianism which at first attracted him in Hartley and Priestley, and which later not even the younger Mill's refinement of the doctrine could make satisfactory to him, any more than Sidgwick's refinement of Bentham's utilitarianism could make him a utilitarian once more. Whether his favorite conceptions stand or fall, they will never have more splendid advocacy than he brought to them for fifty earnest and impassioned years.

INORGANIC CHEMISTRY.

A Text-Book of Inorganic Chemistry. By Dr. A. F. Holleman. Rendered into English by Hermon C. Cooper, Ph.D. John Wiley's Sons. 1902. Pp. viii, 458.

The Principles of Inorganic Chemistry. By Wilhelm Ostwald. Translated by Alexander Findlay, Ph.D. Macmillan. 1902. Pp. xxvii, 785.

Of the many text-books of inorganic chemistry which have appeared during the past few years, the two whose titles are above given deserve special consideration as the first serious attempts to treat the subject from the standpoint of the new theories of physical chemistry. Although Holleman's work was published in the original Dutch in 1898 and in a German translation in 1900, and Ostwald's in German in 1900, these translations, which bring them to the more immediate attention of English-reading chemists, both bear the imprint of the year just elapsed. And let us remark at the outset that the translations are on the whole very good, and have an added trustworthiness from the fact that in both cases the proof was read by the authors.

Professor Holleman's book may be briefly described as a Chemistry much after the usual type, with dissertations on theory interpolated here and there; the author's plan being to insert these chapters "in suitable places" for subsequent reference. The ten-page account of Van't Hoff's generalization and the methods for finding molecular weights from the depression of the freezing point and the elevation of the boiling point, follows the description of hydrogen peroxide (page 56), whose molecular weight cannot be determined by the vapor density method, but may be found by the depression of the freezing point of a dilute solution; the theory of electrolytic dissociation follows the study of the halogen acids; the phase rule is treated in connection with sulphur; nine pages are devoted to thermochemistry after the oxygen group is disposed of; fifteen pages following the alkali metals deal with the properties of salt solutions and the theory of indicators, while a chapter of similar length after mercury is given to the discussion of electrochemistry. Occasional applications of these theories are made in the descriptive text. The latter is concise, clear, and up to date, but for the most part dry and perfunctory, and unusually barren of illustrative experiments.

Whatever may be thought of the suitableness of the places chosen for the introduction of the chapters on theory, and it is certainly open to criticism, we do not believe that Professor Holleman's scheme is to the advantage of the student. These theoretical discussions, which in themselves form a fair outline of the modern views, are taken up before the necessity for them is likely to be felt or their bearing adequately appreciated; and in the pages on thermodynamics as applied to chemistry, if nowhere else, the treatment is too advanced for the average first-year student in chemistry. In the hands of a judicious teacher, however, who uses the book as an outline of facts and for reference rather than as a text-book, it may do good service.

The method which Professor Ostwald has chosen for the solution of the difficulties attending the introduction of theory into general inorganic chemistry is a very different one from Holleman's. A protagonist of the new physical chemistry and possessing recognized literary skill, Ostwald is eminently qualified for such an undertaking. The present work is the result of long consideration; the first sketch dating back, as he states in his preface, "double the time designated by Horace as necessary for the maturing of a literary work." He has endeavored to retain "as much as possible of the approved forms," and to incorporate the new notions and theories of scientific chemistry in such a way that the subject shall be presented wholly from the modern point of view. The book is written with the needs of the student rather than of the teacher as determinative in the treatment, and the subject is carefully developed in an orderly and logical manner. General discussions are introduced only when pertinent facts have paved the way, and as a consequence the same question is taken up repeatedly when the material displayed on its first introduction is inadequate for full treatment. For instance, osmotic pressure is not mentioned until page 657, where a brief account of Van't Hoff's generalization is given, although the empirical facts in regard to the effect of dissolved substances on vapor pressure. boiling and freezing temperatures, are stated on page 133 in connection with a discussion of water as a solvent, and the application of these facts to the determination of molecular weights is made a little further on. In no place does the discussion of theory go beyond a mere outline in simplest form, the complete and connected treatment being left for the more advanced student.

In this respect Ostwald's book is in marked contrast with Holleman's. Theoretical notions are brought forward only as the phenomena already described demand explanation, and then only in such elementary form as may serve to satisfy the necessities of the student's knowledge of that point. The method is well conceived for the stimulation and maintenance of the student's interest, and one must admire the skill with which the inherent difficulties of the plan have been overcome

The rapid and successful development of the new conceptions of physical chemistry by enthusiastic workers has done much to broaden our views of the chemical behavior of substances and to make chemistry a more exact science. But it is at least doubtful whether it is wise to confront the student with anything like complete statements and discussions of these rather difficult theories at the outset of his course, before a sufficient number of chemical facts and relations have been properly appreciated by class-room and laboratory experience. A few simple theoretical notions are pertinent and indeed indispensable almost from the start; but the time-honored practice of leaving the fuller discussion of theory until the ground has been well prepared by a year or two of study, would seem to be much the more rational plan of instruction.

Ostwald's work is always characterized by independence of tradition, and one expects to find some peculiarities of treatment and of emphasis. This volume does not disappoint the expectation. In the paragraphs on the atomic "hypothesis," stress is laid on the tentative character of this speculation: "One must be always prepared for the fact that sooner or later the reality will be different from that which the picture leads one to expect. Especially, when any other well-founded speculation leads to a variance with the atomic hypothesis, one must not on that account regard the speculation as wrong. The blame can quite well attach to the hypothesis." In spite of the fact that the hypothesis agrees entirely with experiment, and "even at the present day rules almost exclusively in chemistry," being of "great value for purposes of instruction and investigation," the author prefers, in "the interest of the science," to employ its terms "as sparingly as ever the present usage of language will permit." Accordingly, the reader finds no "atomic weights" in the book, but the familiar figures of the atomic-weight tables appear as "combining weights." To guard the student still further from the danger of entangling hypotheses, "molar weight" is substituted for "molecular weight," since the latter "is derived from certain hypothetical notions regarding the constitution of gases, notions which are not essential to the actual facts."

In contrast to this exaggerated caution in regard to such older theories, the hypothesis of electrolytic dissociation is given with no hint of the peril which may attend the student's possible confusion of "picture" and "reality." Ions and "moles" swarm in the pages from which atoms and molecules have been banished. The phenomena of catalysis receive a good deal of attention, and are "explained" by the assumption that all possible chemical reactions go on at all temperatures, though often at such extremely slow rates that they entirely escape detection, and that the catalyser is a substance which accelerates the reaction as fresh oil hastens the movement of wheel-work retarded by friction. The analogy extends to the fact that neither oil nor catalyser is used up in acting.

The work is decidedly the most interesting of recent treatises on inorganic chemistry, and everywhere stimulating and suggestive. It is worthy of remark that in neither of these two books in which theory figures so largely, is much stress laid on the periodic system. Both give an account of it—Holleman has thirteen pages in the middle of the volume, and Ostwald five pages at the end; but in neither is the system formally made the basis for the classification of the material, as is the case in some other recent text-books. Ostwald says of it: "We are here not dealing with a law of nature in the strict sense, but with a prin-

ciple of classification of not very exactly defined things. . . . We know only a certain and in part somewhat arbitrarily cut section of the great organism of chemical facts," and "must not therefore be surprised if in this chance section we cannot gain a view of the laws ruling the whole organism." And Holleman, while recognizing the importance of its discovery, goes on to say: "It is gradually becoming more evident that the system in its present form represents the relations of the elements merely in an approximate way, and is only a crude first attempt at a real system."

RECENT NOVELS.

The Little White Bird; or, Adventures in Kensington Gardens. By J. M. Barrie. Charles Scribner's Sons.

The Blue Flower. By Henry Van Dyke. Charles Scribner's Sons.

John Ermine of the Yellowstone. By Frederic Remington. The Macmillan Co.

In the Garden of Charity. By Basil King. Harpers.

The Squireen. By Shan F. Bullock. McClure, Phillips & Co.

According to Mr. Barrie, Kensington Gardens after dark become an actual fairyland. From sunset to sunrise the malls and meadows and waters are alive with nixies and pixies and elfs and goblins, all abandoned to the dance, yet by no means neglecting their serious business of directing mortal destiny. Chief among them is Peter Pan, a delightful sprite, who, being half bird, half boy, is called a "Betwixt and Between." This descriptive epithet may be applied equally to the book in which Peter Pan is celebrated—it is not a real story or a fairy story, not a good book or a bad book—just a Betwixt and Between. Mr. Barrie appears to have written 'The Little White Bird' in a frenzy of baby worship, and he proves beyond any shadow of doubt that woman's passion for the baby, like her other passions, when compared with man's, is as water unto wine. The bachelor Major who directs little David's adventures in Kensington Gardens, dotes more fondly, indeed more shamelessly, than any proud and perfect mother in the land. The Major must have been drawn from Mr. Barrie's inner consciousness. He can have had no opportunity to observe such a major, whose companion warriors (though retired) would have felt it a duty and a point of honor to shoot him rather than let him expose his disordered sensibilities to a scribbling fellow in search of copy. Mr. Barrie gently derides the Major's extravagant sentimentality. Nevertheless, it is plain that he also deeply delights in it, and has no notion that he has written many pages of sad drivel. By way of compensation there are some beautiful chapters revealing the ways of fairies and their affinity with children. With these creatures of the borderland his imagination is at home, and works with rare freedom, purity, and delicacy.

Dr. Van Dyke's tales are avowedly symbolical and allegorical. His theme is the human longing for the ideally perfect, always alluring, always eluding, beautifully symbolized in the 'Blue Flower' of Novalis. Imaginative writers who powerfully stir the lethargic soul, get their effect by a transmission of sensation. Their message is interpreted through feeling more than understanding, and is most inspiring when it is least capable of clear explanation. So profound a symbolist as Maeterlinck relies for comprehension almost entirely on responsive sensation. No one can ever know and explain clearly what he means, but some can feel with great certainty. By far the greater number can neither know nor feel, therefore they jeer; which is easy but not conclusive. Dr. Van Dyke does not get the strongest effect of imaginative symbolism. His work is too cold, too merely intelligent and intelligible, to produce a passionate sensation or haunting impression. It is imaginable that many people read his stories chiefly for the sake of the incident or situation; and, if disturbed at all by the recognition of an inner significance, not specially uplifted or excited thereby. Yet Dr. Van Dyke's popularity is a good sign of the times. There is nothing feeble about his stories. They are strongly imagined and dramatic. They show several sorts of knowledge — knowledge theoretical and knowledge practical, of places and things and life. It may be this conspicuousness of general excellence that forbids the tribute of higher praise.

Mr. Remington is not an accomplished novelist, but he is a very good descriptive writer, and can draw a horse, an Indian, or a cowboy in words almost as vividly as with a pencil. His story 'John Ermine' is therefore more interesting and valuable as fact than as fiction. It is history (probably authentic) of the times when civilization and law were represented in the Far West by scattered army posts, when the buffalo still roamed freely over the plains, and when the whoop of the "Crow Injun" was a frequent menace to the security of the advancing white man. The figure of John Ermine is romantic, and his fate tragic. The girl for whom he died is singularly unworthy of sacrifice, but this fact does not detract from the probability of Ermine's character and conduct, which is excellently sustained throughout.

Mr. Basil King's new book has nothing in common with 'Let Not Man Put Asunder,' on which it is a decided improvement. It is as though Mr. King, having composed an Iliad of feminine caprice and faithlessness, were here atoning by an Odyssey in which all the honors go to the heroine. Charity Byfleet, whose garden with its old English flowers is a rare spot of color on the long, gray, indented shores of the Nova Scotian coast, is the Penelope of the tale. There for eleven years she waits the return of her fickle soldier husband, who had left her for the war three months after her marriage. He meanwhile has been cast ashore during his home-coming and has met with the inevitable Calypso, at Portuguese Point on the coast. The story runs the regular course of the Odyssey, but William Pennland is not a man of many devices, nor does his Calypso prove as amenable as her original. Hagar Levanti, in revenge for his desertion and his threatened return to his wife, rows him out to a small island and leaves him there, without supplies, for a full week. But would a woman as passionately attached to a man as was Hagar Levanti have the strength of mind to live for a week in sight of that island, knowing that the man she loved was dying slowly of starvation? Meanwhile, Charity arrives in time to see her husband die, forgives her rival all, even the murder, and the two women agree to live together and bring up Hagar's child. Apart from the improbabilities, and allowing for a slight overdose of the sentimental, the book is not without interest. The lives of the Nova Scotian fishermen in their cottages on the coast are well described, and there is a considerable display of humor among the minor characters.

Those who know and love Ireland will read Mr. Bullock's tale of pastoral life for the sake of his descriptions rather than for any intrinsic interest in his characters, though they are typical enough. His scene is laid in Ulster, and he dwells on the contrast between Gorteen, "Protestant and fruitful," and the surrounding district, "Catholic and bare." Once you pass the confines and enter the Protestant section,

> "Hedges become trim, lanes and fields orderly, houses neat, offices clean, crops flourishing. You meet fewer stragglers and no beggar men. Pigs keep their styes; goats and donkeys are missed from the wayside. An air of prosperity is abroad, of industry and rude comfort, of independence also, and a more rigid rule of life. The country seems blessed of God, slavery and terror banished from its confines."

After this introduction, one expects Mr. Bullock to develop the illustration of that painful and unavoidable contrast which prevails in Ireland, of Protestant thrift and Catholic mendicancy. But the two families of small proprietors who furnish his characters are both rigid Protestants, of an orthodoxy the more unyielding because of the proximity of "Popery"; "with a Bible on every parlor table and orange lilies in every garden." Mr. Bullock's story illustrates rather that fatal tendency, inherent in so many Irish, to fitful industry and lack of grip on circumstances. It is a painful study of the gradual steps by which a small squire drifts into idleness and debt; gets into the clutches of the local tradesmen, the Shylocks of Irish country life, and loses the home of his fathers and the land that might have supported him in comfort. His father-in-law, with fewer acres, presents the contrast of the hardworking and prosperous farmer, happily by no means so rare in Ireland as is popularly supposed. The characters are well drawn, especially that of Jane Fallon, the Squireen's wife, the typical wife of the spendthrift, on whom the reckoning always falls most heavily. The style of the book is somewhat rhapsodical, but no one to whom Irish scenery is dear could fail to enjoy the atmosphere of 'The Squireen.' It is filled with the sound of the soft fall of rain, with a moist southwest wind, and dim gray skies, with the purple gloom of the heather and the flash of water everywhere. Life in these boglands has its peculiar charm, though the setting seems, of all others, to fit the tragedies of lives that fail. The alienated homestead of the Squireen is before the eyes of every Irish peasant proprietor, for throughout Ireland, Catholic or Protestant, the local spendthrift, losing his grip on the land, is in every district to point a moral.

A History of Siena. By Langton Douglas. E. P. Dutton & Co. 1902.

The Story of Siena and San Gimignano. By Edmund G. Gardner. London: J. M. Dent & Co.; New York: Macmillan. 1902.

Books upon Italy, her history, her saints, her towns, and, above all, her art, are nowadays so frequent that it is impossible for

the current reviews to keep pace with them. It is true that they are seldom worth serious attention; they are due for the most part simply and solely to the daily increasing facilities for travel, and to the cheapness and excellence of the new methods of reproducing works of art. The text, as a rule, is adequate to explain the illustrations, and to guide the traveller to the chief points of artistic and historic interest in a town. Original thinkers, accurate scholars, interesting writers, are as rare in this as in any subject. Dull, parasitic unscholarly books, here as elsewhere, are the order of the day.

Two recent books, however, do not quite fall under this classification. Dull Mr. Douglas's 'History of Siena' does not, nor does unscholarly Mr. Gardner's 'Story of Siena and San Gimignano.' Neither is remarkable for originality, although Mr. Douglas's pages bristle with pretensions to this quality; neither is really important in any way; but Mr. Douglas, until he touches on art, is very readable, and Mr. Gardner's book is careful and extremely useful.

Except the historical works of original thinkers or agreeable stylists, it would be hard to find a better-told story of a people than Mr. Douglas's account of the rise and fall of Siena. He manages to combine exciting dramatic anecdote with the results of the current historical method, and weaves into one intensely interesting narrative tales of combats, heroism, and romance, as well as solid economic fact and general historical considerations. He makes clear, what Mr. Gardner scarcely touches upon, the determining part which commerce played in the politics of Siena; but he does not make it dull. The defects that are so glaring when he comes to speak of matters which call for a finer æsthetic culture than he seems to possess, or a sincere modesty and unpretentiousness which, in Mr. Gardner's book, take the place of personal appreciation, scarcely make themselves felt in the historical part of Mr. Douglas's work. It is more interesting, deeper, and wider than the parallel section of Mr. Gardner's book.

But the defects of taste to which we have alluded are not wholly absent even here. Where Mr. Gardner is unobtrusively helpful, his companion author is obtrusively boastful. The wide difference in the quality of the two writers is apparent in almost the opening sentences. Mr. Gardner tells us that the books listed at the end of his volume "only represent some of those which his readers will find useful and helpful, or that will supply further information on points too detailed to be dwelt on in a short general history." Mr. Douglas, in the tone of swagger to which we grow accustomed as we read his pages, starts out with saying that the elaborate bibliography he gives is "merely a list of the more important books relating to Siena which the author has used in preparing this work." Wherever he can, Mr. Douglas makes blatant claims to being a scholar, while Mr. Gardner makes claim to nothing except useful, well-considered information. Yet, throughout, Mr. Douglas shows himself merely a journalist—a diligent and interesting one, it must be admitted—but a journalist with much of the jauntiness and self-confidence traditional to that character; while Mr. Gardner, well known as a Dante scholar, shows that he possesses the real student's methods and interests. A comparison of the latter's quiet, solid, sympathetic account of St. Catherine with Mr. Douglas's rhetorical, quasi-medical treatise on her whom he calls "the dyer's daughter of Fontebranda," amply establishes this difference.

It is when treating of art, however, that the contrast between the two volumes becomes most clear. Neither writer is an independent art student; but Mr. Gardner quotes and gives ample credit to his authorities, while Mr. Douglas, although making constant use of their attributions, their historical observations, and their æsthetic standards, quotes them only in a few minor points where he conceives them to have blundered. Mr. Gardner is perhaps a little too catholic in his choice of authorities, but he pretends to no more than approving citation, while Mr. Douglas, of two people writing on a given subject, is significantly apt to quote only the one he disagrees with. Mr. Gardner's admiration for Sodoma may seem to be a sign of a still unpurified taste, but it is at least an accepted tradition, and not so inexcusable as Mr. Douglas's estimate of the provincial and over-elaborate sculptor Marinna as superior in "sense of form" to the great Florentine master of classic form, Luca della Robbia.

Mr. Gardner, in never attempting an independent attribution, is wiser than Mr. Douglas, who seldom departs from the beaten track without going wrong. The fatal touch of art-criticism seems to destroy his power of reading history; the reasons being that the interpretation of pictures as documents requires gifts of quite another order from those shown in Mr. Douglas's diligent ransacking of books. Had his eye for pictures been as expert as his eye for print—and this is necessary, if the critic ventures upon original views in art-history—he would not have found Perugino's influence in every picture with a spacious background, or Sassetta's in an artist so remote from his aims as Bonfigli, nor would he have claimed such purely Umbrian painters as Boccatis and Matteo da Gualdo as adherents of a Sienese master separated from them by at least a century. A sense of quality would assuredly have given him a very different estimate of the important achievements in sculpture and painting of such artists as Vecchietta, Francesco di Giorgio, and the fascinating Neroccio, whom he dismisses in a few contemptuous words. His pretence at discussing the Neo-Byzantine School of Tuscany as the necessary preparation—of course omitted by all other art historians!—for the intelligent enjoyment of the early Sienese masters, is a mere piece of bluff, for his treatment of this theme turns out to consist in repeating, what every one knows, that the Neo-Byzantine artists were miniaturists and workers in mosaic, who had a feeling for color and decoration, and a careful technique. Is it a help to the "intelligent enjoyment" of Duccio to say that he improved on their stiffness and freed himself from their conventionality?

On almost all the much-discussed problems of his subject, Mr. Douglas confines himself to an attitude of mystification. "I cannot fully discuss this interesting question here," "The state of our present knowledge does not entitle me to speak with confidence," are samples of the phrases he uses to evade the difficulties. Although, in the opinion of the present writer, Raphael did not furnish the least scrap of assistance to Pintoricchio in the frescoes of the Cathedral Library, as both Mr. Gardner and Mr. Douglas assume, yet it is interesting to note the form their two statements of the question take. Mr. Gardner (p. 175) says that although Vasari's statement that Raphael furnished the cartoons has been denied by serious historians of Italian Art, yet at present a modified acceptance of Vasari's statement is beginning to gain ground. He then refers the reader to Miss E. March Phillips's monograph on Pintoricchio. Mr. Douglas (p. 394), as usual, says it is impossible for him to discuss the question fully in this place. "I can only express my conviction that Schmarzow's arguments have never been satisfactorily answered. I believe" . . . And under this rubric follows—Miss Phillips's conclusions! She is quoted on the next page, not apropos of this discussion, but of her general estimate of Pintoricchio.

Mr. Douglas's history, his careful account of the architecture of the Cathedral—here more accurate than Mr. Gardner's—his excellent, although disproportionately long, chapter on Sienese pottery, show clearly that he can do good work in subjects where fineness of taste and delicacy of eye are not needed. In conclusion, we may add the practical advice that Mr. Gardner's book, especially when it shall appear in a smaller volume uniform with the Dent series of "Mediæval Towns," is eminently a book to be read on the spot, a most helpful guide, which takes you consecutively through all the streets and churches of Siena and San Gimignano, while Mr. Douglas's large volume, arranged rather by subjects than by places, can be read with comfort only at home.

French Engravers and Draughtsmen of the Eighteenth Century. By Lady Dilke. London: George Bell & Sons; New York: Macmillan. Large 8vo. Pp. 227.

This book is made up of brief biographical notices, and of anecdotes and quotations, with but little discussion of either the engraving or the drawing of the epoch treated. But in this it is true to its title. The eighteenth century did not produce much engraving or drawing of great importance; but such as it did produce has its interest in connection with the general history of the fine arts. An intelligent account of the character of engraving and drawing at this epoch would, therefore, be of value; but fragmentary notices of the lives of comparatively unimportant men, without some illuminating discussion of the state of the art of the time, and of its relation to that of other times, are not what we should most desire. Nevertheless, Lady Dilke has produced a pleasant book, from which, in connection with her other volumes on 'French Painters' and 'French Architects of the Eighteenth Century,' with their numerous illustrations, a reader may gather a fairly just idea of the fine arts in France during this epoch of mediocre achievement.

French engraving had been brought to a high degree of excellence in the preceding century in the hands of men like Edelinck and Nanteuil. In the supreme art of Nanteuil, graver work in pure line on copper

reached its highest perfection. At this time the art was in the transition stage from the style of the primitive masters, who aimed at little more than pure delineation with such simple shading, for expression of solid form, as they could manage, to the modern style, in which every quality of color and texture within the possibilities of the process has been attained. This transition was effected chiefly by the school of Flemish engravers who gathered around the painter Rubens, and who sought under his guidance to render, as far as possible, the qualities of his painting. Much in the way of skill in the use of the engraved line to express color and texture was accomplished by these men, among whom the most important were Vorstermans and Pontius; but none of them approached the skill of Nanteuil, which is consummate in its effective and yet wonderfully simple technique.

Among the engravers of whom Lady Dilke writes, several of the earlier ones continued to work in the style of Nanteuil with admirable success. The portrait engravings of Pierre Drevet (1663-1738), after the works of Rigaud and Largillière, are among the most superb examples of pure burin technique that have ever been produced. Lady Dilke (p. 59) quotes Mariette, the engraver and author, as saying that Drevet received from his father "daily lessons in . . . unwearying patience and conscientious devotion to his exacting art." This discipline is apparent in every work of Drevet's hand, and his splendid technique is made the vehicle of expression to an extent almost equal to that of his illustrious predecessor. Few other engravers of the time show the same brilliant powers. Drevet is said to have been the last representative of the school of pure line, and certainly not many subsequent engravers manifest the same powers and the same conscientious skill, though Doullé (born 1703) and Beauvarlet (born 1733) produced some admirable works with little departure from the pure-line method. But, as Lady Dilke remarks, a certain impatience of the labor involved in such work began to declare itself, and means were sought by which it might be abridged. Gerard Audran (born 1640) had already used the process of etching as a foundation for burin work, and we are told (p. 61) that now it became the aim of some engravers to imitate with the graver the free character of line proper to the etching point. With Doullé and his contemporaries "the pure sincerity of their predecessors was unknown." They resort to makeshifts to save labor, while Wille (born 1717) becomes very artificial, and makes his technique a "witness of skill rather than a means of expression."

It was at this time that the passion for collecting began to take its modern form, and, with the advent of the amateur collector, the modern dealer made his appearance. The dealer at first was himself an engraver, and also a publisher of other men's engravings. Foremost among these early dealers were Mariette and Bassan. Both of these men exercised great authority in matters of taste, and they both had a genuine love for the art; but, of the two, Mariette, we are told (p. 30), engaged in the business of buying and selling prints from an enthusiastic devotion to the art itself, while Bassan foreshadows the more modern dealer, who follows the vocation primarily for the money he can make out of it.

The so-called "gravure d'histoire" was now taking the place of the portrait-engraving that had before prevailed, and the commerce in prints of popular subjects was becoming a thriving industry. In the production of works of this class Laurent Cars (1702-1771) was prolific, and Le Bas (1708-1782), "to whom Diderot assigned the unenviable distinction of having given the death-blow to 'la bonne gravure,' was driven to the employment of expeditious methods in order to deal with the enormous quantity of work that he undertook at a low price." An examination of the plates of Le Bas shows that he made extensive use of the more facile and expeditious process of etching, a practice which soon became general, but his burin handling does not appear to have been otherwise materially changed. The newly established publishers now began to issue prints in extended series, and to engage in the publication of sumptuous illustrated books. The rise of book illustration in the modern sense dates from this time, and we get the "dessinateur et graveur," the forerunner of the modern illustrator. The drawing of these men is commonly mediocre enough, though in some instances it rises to excellence, as in the "Sleeping Child," by Gabriel de Saint-Aubin, reproduced opposite page 139.

In chapter x., Lady Dilke discusses the development of new processes which the growing demand for prints, the commercial spirit of the dealers, and the desire for novelties fostered by the spirit of the time. Engraving was becoming a mechanical industry, and the modern principle of division of labor was applied to it. One man now prepared plates by etching in the subject, while another one finished them with the graver. Engravings "à la manière du crayon," imitations by engraving of the effects of chalk drawings, arose, and the tool called the "roulette," which facilitated this kind of work, was introduced. This soon gave rise to the production of colored prints in imitation of colored chalk drawings; and finally the process "au lavis," an imitation of washed drawings, was perfected. All these matters are touched upon in an interesting manner; but one could wish for a fuller discussion and illustration of them. Very little is said of wood engraving, and the important name of Papillon, who advanced this process considerably in the direction of more elaborate execution, is mentioned but once, and then in a footnote. The closing chapter treats of engravers and the Academy, and recounts the struggles of the engravers to obtain a more equal standing with painters and sculptors than had before been accorded them.

The book is handsomely printed, and the illustrations are of fair quality.

Memoirs of Sir Edward Blount. Edited by Stuart J. Reid. New York: Longmans, Green & Co. 1902.

These recollections are more interesting than might be anticipated. When a man has never kept a diary, has destroyed all his letters, and waits until his ninety-fourth year before beginning to tell his story, the result is not apt to be very successful. In this case, however, there are certain incidents which leaven the lump. We can dispense with the official letters and documents recording the eminent services of Sir Edward, with the bows and compliments with which he introduces and dismisses the many distinguished men whom he has known, and even with his accounts of the hardships which he underwent during the siege of Paris. But concerning the early history of railway building on the Continent, and especially in France, Sir Edward's reminiscences have a unique value.

Possibly the fact that the Blounts have always been Catholics may have had something to do with Sir Edward's successful career in France. The family was originally of Picardy, but three of its members came over with the Conqueror, two of them remaining. At a tenants' dinner at the seat of the family, in Shropshire, one of them exhibited documentary proofs that his ancestors had been either in the employment of, or tenant farmers under, the Blount family for nearly 800 years.

The author of these memoirs, on leaving school, entered the London office of the Provincial Bank of Ireland, just established as a Catholic institution, in opposition to the National Bank of Ireland, which was of Protestant finance. After a short time he obtained a place in the Home Office, and in 1829 became an attaché of the British Embassy in Paris. In 1831 he left the public service finally, and was for the rest of his life actively employed in Paris as a banker, and as a railway financier and manager.

Seventy years ago the horrors of the custom house were everywhere as frightful as they now are in New York. Passengers, male and female, crossing the Channel, were searched; and at the Belgian frontier Mr. Blount was once deprived of six of his week's supply of seven razors, on the ground that no man could use so many. Some years later he rendered a memorable service to travellers in procuring the abolition of an inveterate nuisance. He was received in his capacity as director of the Austrian Railway, with two of his colleagues, by the Emperor, who pointedly asked what he could do for him. To the disgust of his companions, instead of intimating that decorations would be acceptable, he explained the annoyance to which passengers were subjected by having trains stopped at the frontiers, often in the middle of the night, in order that soldiers might demand passports. Within a fortnight the practice was ended.

In 1836 there were nearly two thousand miles of railway in England, while there were but twenty-five in France. A bill for the construction of seven trunk lines, brought in by the Government in 1838, was rejected by a majority of three to one. Mr. Blount, however, went to M. Dufaure, Minister of Public Works, and asked for leave to build a line from Paris to Rouen with English capital. It was finally arranged that if £600,000 could be raised in England, and a like sum in France, the Government would guarantee an equal amount. The arrangement was carried out in 1840, and in 1843 the road was opened. It was laid out by English engineers, built by English contractors—Brassey and Mackenzie—and operated by English mechanics. Even now the English and not the French rule of

the road is followed on the railways of France.

This road was the precursor of many others, in which Mr. Blount was interested, notably the Western of France Railway. Of this line he was chairman for thirty years, and might still be, but for a violent "Jingo" speech made by him at a time when the relations between England and France were strained. He could have retained his position, but to have done so would have caused the passage of a law requiring all railway directors thereafter elected to have the approval of the Government. This would have meant the exclusion of many worthy men who had been partisans of former régimes—Imperialists, Orleanists, etc.—who could not afford to lose their salaries, and Sir Edward very honorably yielded. From the military point of view it must be said that it was intolerable to have a great French railway managed by a citizen of a country with which war was possible, especially when that citizen had proclaimed himself a Jingo of the Jingoes.

Many incidents of the revolutions of 1830 and of 1848 are here detailed, and make interesting reading. These fields, however, have been well covered by many others, and the author's part, spirited and even heroic as it was, has rather a personal than an historical importance. His tribute to Mr. Brassey is enthusiastic, and brings out the splendid generosity of that great captain of industry. In spite of his colossal enterprises, he told Mr. Blount that his net profit, after deducting all losses, was about 3 per cent. upon all that he had done. Mr. Blount knew well the statesmen of the Second Empire, and his estimates of them deserve attention. His book might have been a great deal better; but it has merit.

A History of the Babylonians and Assyrians. By George Stephen Goodspeed, Ph.D., Professor of Ancient History in the University of Chicago. New York: Charles Scribner's Sons. 8vo, pp. xiii., 422.

This volume continues the Historical Series for Bible Students edited by Professors Kent and Sanders of Yale University, and in general maintains the same high standard represented by Kent's and Riggs's volumes on the history of the Hebrew and Jewish people. It is the best condensed history of Babylonia and Assyria yet published. It is well furnished at the close with a chronological list, bibliography, references, and an index of names and subjects, but of maps there is only one, at the commencement, and that leaves much to be desired. We notice the persistence of a curiously perverse blunder, repeated in map after map of Babylonia since the time of Delitzsch's 'Wo lag das Paradies.' In Delitzsch's map, by some accident, the ancient city of Eridu was placed on the east side of the Euphrates, below the Shatt en-Nil. The site of Eridu is well known. It lies to the west of the Euphrates, a little above the junction of the Shatt en-Nil with that river. The ancient Ur is also misplaced in this map, and canals are thrown in here and there on general principles. In short, it is very unsatisfactory, and not worthy of the excellent little volume to which it is prefixed.

Dr. Goodspeed still holds to the earlier date of Sargon, 3800 B. C., which, of course, throws his whole chronology back a thousand years; but his general treatment of the earlier periods of Babylonian history is noticeably conservative. On the Sumerian question he displays the same cautious attitude: "The facts are not decisive, and the fundamental questions must await final adjudication till a time when either new documents for philological investigation are discovered, or light is obtained from other than linguistic sources" (p. 30).

In accounting for the temporary downfall of the Assyrian empire, immediately after the campaigns of Tiglath Pileser I., 1100 B. C., Dr. Goodspeed states very effectively a fact which we have not seen presented in former histories, namely, that "a series of mighty movements of peoples took place in the world without, which swept away Assyria's authority over her provincial districts, encroached upon her territory, threw Babylonia into civil war, paralyzed all foreign trade, and afforded opportunity for the consolidation of rival powers on the borders of both nations" (pp. 179, 180). He might have added, although it is not necessarily within the scope of his work, that it was this same movement, affecting the whole civilized world of the period, which overturned the Mykenæan civilization in Greece and Crete.

It is probably unavoidable, in writing history, to indulge in speculation. Now the Assyrian and Babylonian documents which have come down to us are in general either dry records of facts, one-sided accounts of the campaigns and other achievements of kings, or commercial documents. Nothing exists to show us with any certainty the inner motives of movements and events. A king or dynasty falls and a successor takes the throne; we know the facts and nothing more. Professor Goodspeed enters into speculations as to the causes of these changes, speculations as to conflicts between royal and priestly power and the like, which are interesting, but rest on no secure basis. His speculations only reveal to us more clearly the limitations of our present knowledge in regard to the inner history of Babylonia and Assyria. He also shows a tendency in not a few instances to reverse the verdict of former writers, rehabilitating sovereigns condemned by them and vice-versa. This is notably the case with Esarhaddon of Assyria and Nebuchadnezzar the Great of Babylon, the latter of whom especially he would fain remove from his present eminence as one of the greatest kings of antiquity. On the other hand, the much-abused Sennacherib meets here with high commendation.

The volume is interestingly written, and, at the same time, Professor Goodspeed has succeeded in condensing a large amount of information in a small space.

Demetrius on Style. With introduction, translation, facsimiles, etc. By W. Rhys Roberts, Litt. D. Cambridge (Eng.): University Press; New York: Macmillan. 1902.

Professor Roberts presents in the volume before us the third part of his chosen task in the elucidation of the most important Greek material on the subject of Rhetoric and Literary Criticism. The three Literary Letters of Dionysius of Halicarnassus appeared a year ago, and the treatise of Longinus on the Sublime in 1899. There is yet to come a critical and annotated edition of the Rhetoric of Aristotle and a general History of Greek Literary Criticism, the former of which might seem scarcely necessary within a generation of the voluminous work of E. M. Cope, edited by Sandys in 1877, and reinforced since that date by a fair supply of periodical literature in various tongues, accessible to most of those who care to make a special study of Aristotle's great work. As to the authorship and date of the work in hand, Mr. Roberts claims no ability to solve the problem which has baffled so many others. The author was certainly not Demetrius of Phalerum, and it is far from certain that he was any one of the many who bore that name. As to date, the probabilities lie within a century of the beginning of the Christian era, before or after. The fact that the treatise is not mentioned by Quintilian might fairly be taken as strengthening the hypothesis of a late date, since the common-sense views presented are such as would naturally have appealed to Quintilian, and the work could hardly have been published much in advance of his time without coming to his attention in the wide reading which preceded and accompanied the composition of the *Institutio Oratoria.* The translation does not, of course, elude all the difficulties which such a subject involves, especially when it comes to dealing with illustrations. For example: "Force of style will also mark a sentence of this kind: 'He turned upside down in his folly and his impiety too, things sacred and things holy too.'" The repetition of the word *too,* and its position, represent the external form of the Greek closely enough, but to call such a form forcible when transferred to the English is manifestly absurd. There are about fifty pages of notes, a good glossary of technical terms, a bibliography, and indices. It is noticeable that the bibliography contains no entries in the English language except two references to articles in the *Classical Review* contributed by Professor Roberts himself in the course of his preparation of this volume.

Saintsbury, in the first volume of his 'History of Criticism,' gives this treatise rather scant and unsatisfactory notice. The best he has to say for it is that the author was "not far from the kingdom." Professor Roberts is justified in calling it a great aid to the study of Greek literature on the more formal side, and in hoping to see it recognized as having a distinct relation to the theory and practice of English composition. If his edition shall further its use toward that end, the labor of preparation will have been well worth while.

A History of German Literature. By John G. Robertson, Lecturer in the University of Strassburg. G. P. Putnam's Sons. 1902. Pp. 635.

It may be doubted whether manuals of literature, such as Dr. Robertson has compiled in this volume, are of real value either for the scholar or for the general public. To the student they give no new light, and the layman receives no inspiration from them. Their principal use seems to consist in recording from time to time, for the benefit of the librarian and the

bibliographer, the accretions to a given literature, both in scientific investigation and in artistic production. With these qualifications as to its intrinsic value, it should be said that Dr. Robertson's book is worthy of genuine praise. It is the result of most conscientious study and very wide reading; is written without any personal bias, and in a most sympathetic spirit; avoids all fancifulness and flippancy; and strives with remarkable success for completeness of information as to names, dates, synopses of books, and similar detail.

Furthermore, this is probably the first book of its kind (and herein lies its chief interest from the scholarly point of view) which considers German literature in its relation to other European literatures—above all, French and English; and one cannot help wishing that it might have been possible for Dr. Robertson to make this the leading feature of his work. The luminous comparison which, in the introduction, he draws between the fundamental characteristics of what Madame de Staël called "la littérature du nord" and "la littérature du midi," his penetrating analysis of the causes which have made the historical development of German culture so widely different from that of the other nations of Europe, as well as numerous sidelights of a similar sort scattered throughout the book, show that he was admirably equipped for such a task. Let us hope that he has in store for us a treatise which will bring out in clear and strong outline the history of German literature as affected by intellectual and artistic influences emanating from other countries. By writing such a book, he will do a great service to literary history.

Meanwhile, it would be ungrateful not to acknowledge that this manual is a thoroughly trustworthy Baedeker for the familiar routes in German literature, superseding once for all the sorry lot of dilettanteish compilations which have served as guide-books in this domain during the last generation. This in itself is a service not to be underestimated. That, in addition to this, there is a literary flavor to the book, which clearly asserts itself whenever the narrative is not burdened with bibliographical detail, may be gathered from the following passage from the chapter on Gottfried von Strassburg's 'Tristan':

"One of the secrets of Gottfried's mastery as a love-poet is his unrelenting earnestness; indeed, the earnestness that lies over *Tristan* merges almost into melancholy. No gleam of humor relieves the tragedy of the story, no touch of frivolity: *Tristan* is the most serious of all the court epics. We may possibly be doing Gottfried's lost model an injustice in giving the German poet credit for those elements in *Tristan* which entitle it to be regarded as great poetry; but the warmth and the heartfelt sincerity of the German epic are foreign to the French temperament, as far, at least, as that temperament is expressed in French mediæval literature. Gottfried's conception of love is essentially Germanic; it is the love of Romeo and Juliet, the love that inspires Goethe's lyrics and the poetry of German Romanticism."

Modern Practical Joinery: A Treatise on the Practice of Joiner's Work by Hand and Machine for the Use of Apprentices, Workmen and Builders, etc. By George Ellis. With about 1,000 clear and practical illustrations. London: B. T. Batsford; New York: Charles Scribner's Sons. 1902. Pp. xii., 379. $5.00.

Measured Drawings of Old Oak English Furniture; also, of some Remains of Architectural Woodwork, Plasterwork, Metalwork, Glazing, etc. By John Weymouth Hurrell. London: B. T. Batsford; New York: Charles Scribner's Sons. 1902. $15.00.

Here are two books which deal with woodwork in building, but of the finer kind, such as we call joinery or cabinet-work, rather than carpentry on a large scale. In a curious way the two books are the complement each of the other. The first-named is as utilitarian as it can be made, the second is devoted exclusively to refinements of design.

The treatise on joinery, by Mr. George Ellis, takes up the subject of woodworking by hand at the very beginning, and deals with the tools employed (chapter ii.), then with the workshop appliances, as work-benches, mitre-blocks, grindstones, and the rest, and with the ordinary practice of the workshop, planing and mortising, dovetailing and wedging, occupying with these subjects chapters iii. and iv. The making of joints is very properly treated at length and with minute particularity, and has a whole chapter devoted to it. Coming, then, to more specified practice, chapter vi. is devoted to doors and gates, chapter vii. to door frames and the like, chapters viii. and ix. to windows, shutters, and blinds; and in this manner the whole field of the finer woodworking for buildings is passed in review. Few items are overlooked, few requirements fail to be stated; a chapter is devoted to foreman's work and another to the fixing or putting into place of joiner's work, as when the trim, as we have it in America, is put up in a house where it belongs; and the two chapters at the end are devoted to timber, with a description of different woods.

In the attempt to cover the whole ground, thirty pages are devoted to stairbuilding; and here more than elsewhere there is an obvious brevity of treatment which may be thought inadequate, for the question of stairbuilding is one to which volumes bigger than this one have been devoted, and without exhausting the subject. However, what is told is the right thing to say. The author has not failed to put down interesting things because he had not much space within which to expatiate. He offers a good and tolerably complete list of the "technical terms used in stairbuilding and handrailing," and gives useful hints among his "general remarks," as where he reminds the builder that "dividing landings by a single step should be avoided, as these prove traps for the unwary." That is a rule which ought to be insisted on in the United States, for it is a common trick with us to divide what Englishmen call generally a halfpace, that is, a platform which crosses two flights of stairs, one arriving and the other departing from it on the upward course, and the two side by side and parallel. Such a landing cut in halves, making of it two square platforms, provides, as indeed our author says, a trap for every one who does not know the staircase intimately and finds it not brilliantly lighted up. If a complete building law were ever to be undertaken, the prohibition of such mischievous devices as that might well form a by-law apart.

As to the book under consideration, no attempt is made to present novel or even modern designs, or to preserve a common style of design, or yet to present designs of intelligence or of artistic merit. The simple British ways of shaping a window-frame with arched head, and a similar frame but with a square head; the obvious and everyday fashion of making a door and building its casing and hanging it by hinges; the century-old plans of building up stairs by means of glued blocks and sprung mouldings, are all accepted as matters of course, without comment and without criticism. The author's business is merely to show the workman how these things are to be done, and he does not abandon this plan of teaching the workshop methods only, except for an occasional comment on matters of convenience and inconvenience, or as to the greater or less strength and durability of a material or of the mechanical process.

The text is abundantly supplied with illustrations, all of them drawn in an intelligent way in plain black lines, and there are a few folding plates provided for the combined display of all the parts of the complicated structure, as a writing table with a multiplicity of drawers, or a "circle sash frame" with all its details. There is a fairly complete index, and a glossary of terms which seems inadequate in that the definitions are so very brief that only a practised mechanic would understand them. Such definitions may serve to settle a dispute between two technicians, but not to instruct an outsider. Such brevity leads also to error, as, for instance, "Gothic Arch. A pointed arch. These were solely used in the architecture of the Middle Ages"; a definition which contains or implies two or three errors. So "Grating. A wood lattice used to protect gutters from snow," as if there were no other gratings in use in Great Britain than in that one connection. The list of terms used in stairbuilding and given in chapter xv. is, however, to be considered with the glossary proper; and the two may be taken as forming in reality one dictionary of terms.

The book is bound or cased in brown buckram of a pleasant color, and this piece of work seems to be strongly done—not at all in the curiously feeble way in which cloth cases are so commonly put upon English books. The volume will stand workshop wear for several years.

Mr. Hurrell's book consists of a hundred and ten plates, with a brief preface, a classified list of the "subjects of the plates," and nothing else whatever. This table or list sets forth that Plates 1 to 13 with 19 and 20 are devoted to Cabinets, while Ironwork has three plates and Brasswork three, Leaded Lights two, and an ornamental Lead Cistern one (Plate 90). There are included among the ceilings, to which subject six pages are devoted, some of plaster, and indeed there are only two of oak. It may be said, then, that three-fourths of the book is devoted to the details of joiner's work with elaborate carving in oak, all of the Elizabethan and Jacobean periods, and that one-fourth is devoted to metalwork, plasterwork, and the rest, of the same period. The Preface states the author's purpose to be the giving of

accurate measurements and careful delineation to scale without the aid of pictorial effect; and its purpose has been kept steadily in view. In fact, exception might be taken to the difficulty one finds in grasping readily the significance of the details which are crowded together upon a given page. Even the practised student may be annoyed somewhat and at least made impatient by the lack of a little freehand drawing in the corner, which would show him the general effect of the armchair or cupboard; for even such a student must take time and thinking to construct a mental image of the completed piece—and after all it is a great help to know in advance what the completed piece is like. No other such deficiency can be urged. The drawings have all the appearance of exactitude, and although it has been impracticable to point out in all cases which mouldings are planted-on and which are carved in the solid, because that cannot be ascertained in every case and because also it does not affect the existing design, yet the modern artist is free to follow the more thorough or the slighter method as he may prefer.

Attention must be called to this fact, that the author has gone, for his examples, to the most interesting buildings and to the most famous collections of old furniture in England. Bramhall and Little Moreton Hall in Cheshire, Chetham's College in Manchester, Plasmawr in Conway in Wales, and an old house which stood at Leek in Staffordshire until it was pulled down in 1897, have furnished much of his material.

BOOKS OF THE WEEK.

Anthony, Susan B., and Harper, Ida H. The History of Woman Suffrage. Vol. IV. Rochester: Susan B. Anthony.

Dorman, M. R. P. A History of the British Empire in the Nineteenth Century. Vol. I. London: Kegan Paul, Trench, Trübner & Co.; Philadelphia: J. B. Lippincott Co.

Euripides. Translated into English Rhyming Verse by Gilbert Murray. Longmans, Green & Co. $2.

Hazell's Annual for 1903. Edited by W. Palmer. London: Hazell, Watson & Viney; New York: Scribners. $1.50.

Hewitt, J. F. History and Chronology of the Myth-Making Age. London: James Parker & Co.; New York: E. P. Dutton & Co. $6.

SPECIAL NOTICE

Sale of the Second Part of the

Magnificent Private Library

Of HAROLD PEIRCE of Philadelphia

Under the management of STAN. V. HENKELS

In the Book Salesroom of DAVIS & HARVEY, Auctioneers,

1112 WALNUT ST., PHILADELPHIA

Commencing FRIDAY Afternoon, March 27th, at 2:30 o'clock, and Continuing in the Evening and Next Morning.

THIS portion of the Library includes the most valuable collection of Kelmscott Press issues ever offered at public or private sale, embracing many presentation copies from Wm. Morris, as well as not a few of the vellum copies, many important manuscripts of Wm. Morris, very characteristic of the Poet, and an unique collection of his early writings.

Also full Sets (both vellum and paper) of the Doves Press, Vale Press, Essex House Press, including both the Vellum Prayer Book and Psalter, and the Daniels Press.

Exceedingly important Collection of First Editions of Ruskin, embracing the very rare first edition of his Poems published by his father, and presented to Ruskin's wife, who was afterward the wife of Sir Jno. E. Millais, and several interesting letters to his friends. First editions of Rossetti, including an unique copy of the Germ, in the original parts, and several characteristic letters written by him. First Editions of Tennyson, with a fine copy of his poem "Timbuctoo" ridiculed by Thackeray. First editions of Swinburne and John Addington Symonds, including a magnificent copy "Renaissance in Italy" in almost a new state.

The sale will conclude with choice Editions of English and American Authors, containing the Edinburgh Stevenson Large Paper 1860 Edition of Irving, The Townsend Cooper, Macmillan's English Classics, The Tudor Translations, Limited large paper copies of Houghton, Mifflin & Co.'s Riverside Press Edition of the works of Emerson, Hawthorne, Longfellow, Whittier, Lowell, Holmes, and Thoreau, The Works of Dickens, Byron, Carlyle, Balzac, Daudet, Dumas, Gautier, Hugo, Kingsley, Poe, Goldsmith, Tennyson, Voltaire, etc., etc.

Catalogues now ready. The balance of the library will be included in about three more parts, and are to be sold at 50c. per part. Address

The Nation

VOL. LXXVI—NO. 1969. THURSDAY, MARCH 26, 1903. PRICE TEN CENTS.

Superb Nature Books in Colors.

BIRD LIFE

By Frank M. Chapman, associate Curator of Mammalogy and Ornithology in the American Museum of Natural History.

12mo, cloth, with 75 full-page lithographic plates of birds in natural colors, reproducing Ernest Seton-Thompson's Drawings. $2.00 net; postage 18 cents additional.

"This is a new edition of a work already deservedly popular. It has gained recognition as the standard authority on our common birds. . . . Mr. Seton-Thompson's artistic work needs no comment. In text and illustration this new edition is easily first among the books upon common birds."—*Cleveland World.*

FAMILIAR TREES AND THEIR LEAVES

By F. Schuyler Mathews. New edition. With 12 pictures of representative trees in colors, and over 200 drawings from nature by the author. With the botanical name and habitat of each tree and a record of the precise character and color of its leafage.

8vo. Cloth, $1.75 net; postage 18 cents additional.

"Here is a book that cannot be amiss in any library; we point it out with confidence, hoping to have our readers share our enjoyment of it. From first page to last the text is interesting, and the leaf figures and other drawings are accurate and attractive."—*New York Independent.*

FAMILIAR FLOWERS OF FIELD AND GARDEN

By F. Schuyler Mathews. New edition. With 12 orthochromatic photographs of characteristic flowers by L. W. Brownell, and over 200 drawings by the author.

12mo. Cloth, $1.40 net; postage 18 cents additional.

"Charmingly written, and to any one who loves the flowers—and who does not?—will prove no less fascinating than instructive. It will open up in the garden and the fields a new world full of curiosity and delight, and invest them with a new interest in his sight."—*Christian Work.*

INSECT LIFE

By John Henry Comstock, Professor of Entomology in Cornell University. New Edition. With full-page plates reproducing butterflies and various insects in their natural colors, and with many wood engravings by Anna Botsford Comstock, Member of the Society of American Wood Engravers.

8vo. Cloth, $1.75 net; postage, 20 cents additional.

"I have examined Comstock's 'Insect Life.' It is attractively arranged, and the descriptions are as plain and untechnical as consistent in discussing the subject. Part II. The Collection and Preservation of Specimens, is indeed very useful. The chapter on rearing insects is the best I have seen. The illustrations are plentiful and good. It is the book that every person interested in entomology should have, and it should find a place in every library."—E. E. Bogue, Botanist and Entomologist of the Oklahoma Agricultural Experiment Station.

Today's New Books

BY A FAVORITE AUTHOR

THE MANNERINGS

By Alice Brown

This double love story, whose scene is laid at a charm ng country-house, is the most vital and dramatic work that Miss Brown has yet produced. Crown 8vo, $1.50.

A STORY OF MUCH INTEREST

THE LEGATEE

By Alice Prescott Smith

A vivid picture of life in a Wisconsin lumber town and the terrors of a forest fire. The love affair which runs through the story is a singularly attractive one. Crown 8vo, $1.50.

AN ENTERTAINING HISTORY

YOUNG PEOPLE'S HISTORY OF HOLLAND

By William Elliot Griffis

How a very little country overcame great obstacles and became so influential in the world, told in a vivid and interesting manner, and enlivened by many anecdotes and illustrations. Crown 8vo, $1.50 *net.* Postage extra.

A BOOK FOR ARTIST AND LAYMAN

THE ENJOYMENT OF ART

By Carleton Noyes

A bock setting forth in simple, untechnical fashion, the nature and the meaning of a work of art. It is a book for all lovers of pictures, music and books. Crown 8vo, $1.00 *net.* Postage extra.

IMPORTANT PERIODS IN ART

GREAT EPOCHS IN ART HISTORY

By James M. Hoppin

New and Revised Edition

Professor Hoppin has just revised this popular and attractive book, in which he treats with keen appreciation and criticism four important periods of art—Italian Religious Painting, Greek Sculpture, French Gothic Architecture, and English Pre-Raphaelitism. With illustrations. Crown 8vo, $1.75 *net.* Postpaid, $1.94.

NEW TWO-VOLUME EDITION

CHARLES ELIOT, LANDSCAPE ARCHITECT

By Charles W. Eliot

This important work is now brought out in a more convenient two-volume form as well as in one volume. It has been accepted as a most unusual and valuable contribution to the new art of landscape architecture as well as an interesting autobiography of a remarkable man. With many illustrations. In I. vol., $3.50 *net.* Postpaid, $3.79. In II. vols., $4.00 *net.* Postage extra.

At All Bookstores.

HOUGHTON, MIFFLIN & COMPANY, Boston and New York.

By VIOLET JACOB. *12°, net, $1.20*

The **SHEEP-STEALERS**

So fresh, so wholesome, so original. —*The Spectator.*

IF YOU WANT TO KNOW ALL ABOUT Ex-Speaker Thomas B. Reed's great library of MODERN ELOQUENCE, and if you would like a handsome portfolio of specimen pages, including fine photogravure illustrations, address the publishers, JOHN D. MORRIS & CO., 1163 Commonwealth Bldg., Philadelphia.

A Girl Lost and Reclaimed.

A Novel by
LUCY RIDER MEYER, $1.50.

FAMILY HISTORY.—Mr. TUDOR SHERWOOD, with many years' experience of Records and Record-searching in Great Britain and Ireland, can now accept commissions to gather Record-evidence of Family History, Descent, and the Right to Bear Arms.
Address 50 Becroft Road, Brockley, London, S. E.

THE IMPORTANT NEW BOOKS

JUST READY

Mr. WIRT GERRARE'S

Greater Russia

THE CONTINENTAL EMPIRE OF THE OLD WORLD

Describes present conditions, and the commercial and industrial development of the empire; incidentally, also, the openings for foreign enterprise and investment.

Cloth. Illustrated. 8vo, $3.00 net. (Postage, 22c.)

GERTRUDE ATHERTON'S *Selection of*

A Few of Hamilton's Letters

Including his description of the West Indian hurricane of 1772.

Cloth, $1.50 net. (Postage, 13c.)

Like the great portrait of Hamilton in her novel, "The Conqueror," this "stands in a place by itself among recent things of the sort." —*N. Y. Sun.*

Mrs. ELY'S *charming book*

A Woman's Hardy Garden

Is "one of the most attractively written and most practical" of garden books, says the *Philadelphia Ledger*, adding: "It is to be unqualifiedly recommended."

Second edition, third in press. Cloth. Illustrated. $1.75 net. (Postage, 13c.)

CARL HILTY'S *recently issued essays*

Translated by Prof. F. G. PEABODY

Happiness:

Essays on the Meaning of Life

"An amazingly successful attempt to interpret with engaging directness the modern world to the end of achieving a happy, rational and useful life."—*Boston Herald.*

Cloth, 16mo, $1.25 net. (Postage, 7c.)

Mr. ZANGWILL'S *new book*

The Grey Wig

Is, according to the author himself, "mainly a study of women."

By ISRAEL ZANGWILL, *Author of "Children of the Ghetto," "They That Walk in Darkness,"* etc.

Cloth, $1.50.

Mr. LAWSON'S *new novel*

From the Unvarying Star

A story of a country parish, with a passionate love interest on a spiritual level which suggests GEORGE MACDONALD'S "Annals of a Quiet Neighborhood."

By ELSWORTH LAWSON, *Author of "Euphrosyne and Her Golden Book."* *Cloth, $1.50*

READY TO-DAY

Mr. PAUL GWYNNE'S *novel*

The Pagan at the Shrine

is a story of southern Spain in the time of the Carlist and anti-Jesuit agitation; an intensely human, daring story of the warring passions. *Cloth, 12mo, $1.50.*

Mr. GEO. CRAM COOK'S *novel*

Roderick Taliaferro

is a thrilling, clear-cut story of the adventures in love and war of an ex-Confederate soldier, an officer in the Army of the Mexican Empire under the ill-fated Maximilian.

Illustrated by SEYMOUR M. STONE. *Cloth, 12mo, $1.50.*

Mr. PERCY MACKAYE'S *play*

The Canterbury Pilgrims

is a daring scheme, carried out in such an original way that Mr. E. H. Sothern will undertake the stage production of it. The comedy is full of movement and poetry and of interest to lovers of good verse as well as playgoers. Chaucer in the role of a lover is one of the characters.

Cloth, 16mo, $1.25 net (postage 10c.)

By CORREA MOYLAN WALSH

THE FUNDAMENTAL PROBLEM IN MONETARY SCIENCE

Just ready. Cloth, x+383 pp. $1.50 *net.* (Postage 13c.)

THE MEASUREMENT OF GENERAL EXCHANGE-VALUE, 1901.

Cloth, 8vo, xvi+580 pp. $3.00 *net.* (Postage 26c.)

"A work of special research of great value in a field where many others have labored, but none with such thoroughness." —*Manchester Guardian*, Eng.

By LESTER F. WARD

Author of "Outlines of Sociology," etc.

Pure Sociology

A Treatise on the Origin and Spontaneous Development of Society.

Cloth 8vo. $4.00 *net* (postage, 27c.)

This differs from previous works by the same author in dealing only with the pure science of the fundamental conditions and results of human achievement.

By SIMON N. PATTEN,

University of Pennsylvania

HEREDITY AND SOCIAL PROGRESS

An interesting treatment of pertinent questions by the author of "The Theory of Prosperity." $1.25 *net* (postage 9c.)

By C. EDWARD MERRIAM,

Chicago University

AMERICAN POLITICAL THEORIES

A descriptive and analytical discussion of characteristic types.

Cloth, 12mo, $1.50 *net* (postage 11c.)

On net books ordered from the publisher carriage is an extra charge; they are for sale by all dealers at net rates.

Published by **THE MACMILLAN COMPANY** 66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 26, 1903.

The Week.

Whatever real danger there may be of the Panama Treaty failing in Colombia will arise from disappointment there in the matter of general pecuniary expectations. These were extravagantly and ridiculously high. The $10,000,000 finally agreed upon was as nothing to what the Colombians looked for—and, indeed, demanded at first. At the very least, $30,000,000 was to be had from a rich country with a bursting Treasury which had done the unbusinesslike thing of first telling Colombia that it was going to buy her canal, and then asking her to name her price. To all the remonstrances of Secretary Hay, the one answer was that given by the Brazilian arbitrator at Geneva to the Englishmen who protested against the size of the Alabama award—"Vous êtes riches." Indeed, so high were Colombian hopes pitched that when Minister Silva, being a man of sense, told his Government that it would be impossible to obtain more than $10,000,000, he was recalled in a rage and practically hounded to death after he got home. His goods were sequestrated, he was exiled from the capital, and finally died in what was practically imprisonment. His fate gives one some idea of the way in which popular sentiment was running in Colombia at the time, and, as we say, of the nature of the real perils which the treaty has yet to encounter before final ratification by the Colombian Congress. These may easily prove serious, yet we are confident that they will be surmounted.

Not the least interesting phase of the Panama Canal settlement is the problem of remitting the purchase money. Forty million dollars is a substantial sum to draw in a brief space of time from a given money market. It is true that the Treasury has a surplus fund largely in excess of $200,000,000. But of this sum, $150,800,000 is on deposit with the banks, and therefore employed in the money market, while the ba'ance held in the Treasury's own vaults exceeds by only twenty or twenty-five millions the sum which the Government habitually keeps for its cash exchanges. If, therefore, the purchase money were to be paid to the French owners of the property in cash, a heavy draft on bank reserves would be necessary. Such large international payments, however, are not primarily made in exported coin, but in sterling bills, by use of which the recipient draws on London. As a rule, such bills are on three or six months' time. When, however, they mature, they must be met by the American market. Payment may then be adjusted in one of three ways: by borrowing abroad again, renewing the bills as they mature; by selling to Europe enough of merchandise or securities to offset its claim; or by sending gold. It is impossible to say, at the moment, which of the three expedients will in the present instance be adopted. That is a question largely dependent on the state of the money market and the promise of this season's harvests. The question is interesting chiefly because of the present strain on New York's market, and the low figure at which bank reserves stand.

Even if the Cuban treaty had not been tortured out of its original semblance, it would still lag two years behind our pledges. It was early in 1901 that President McKinley and Secretary Root formally and solemnly promised the Cubans to admit their sugar and tobacco to our markets at a reduction of 20 per cent. from the Dingley rates. We have thus been an unconscionable time keeping our word. Even so, we have made our grudging fulfilment practically valueless by new stipulations. As the treaty stands, it cannot go into effect until after Congress has had one more chance to repudiate a promise. More than that, it has been loaded down with one-sided amendments. Cuba had made large concessions to our trade in order to secure favorable treatment for her products, but the Senate has insisted upon much larger concessions. In an ordinary case, this would be tantamount to killing the treaty, since the party of the other part would not consent to what it would be sure to regard as an unjust demand. Even as the matter rests, there is danger that the treaty may perish. The period within which ratifications were to be exchanged ends with March 31. The Cuban Senate, after ratifying the treaty as it stood, adjourned until April, and had to be reconvened expressly. Its action is uncertain and delay may ensue. The situation can no doubt be saved by a supplementary agreement between the two Governments, but the natural, and perhaps the designed, effect of the Senate's action would be to give the treaty the finishing blow then and there. Our record in the whole affair is most melancholy. It does credit neither to our business shrewdness nor to our sense of national honor.

Neither Gen. Leonard Wood nor the American public should be satisfied with his off-hand denial of the charges made against him by Estes G. Rathbone. With the latter's contention that he has been the victim of gross injustice, we have never had any sympathy. He has, however, put his finger upon some things in Gen. Wood's record which can be cleared up only by an official investigation. This is plainly called for. Ever since Gen. Wood left Havana, rumors have been rife that both he and a member of his family accepted presents from the gambling combine which made enormous profits out of the *jai alai* game. In his recent denial Gen. Wood states that the personal presents he received were gifts from a delegation of Spanish merchants. Just who these "merchants" were is the point at issue. That there were no Cubans among them is due primarily to the General's unpopularity with all classes of the native-born islanders. The public belief was that the "merchants" were those who profited by the gambling allowed by the American authorities, and Gen. Wood owes it to himself and the honor of the army to show beyond doubt that the donors had no connection with so scandalous and disreputable an institution.

Incidentally, Gen. Wood ought to explain why this gaming was tolerated under his administration. It was never permitted by the Spanish Governors, and never obtained a foothold until a year and a half before the end of the American occupation. Gen. Brooke suppressed the Havana lottery and had passed strict anti-gambling laws which were enforced for a time. Under the plea that it was properly licensed and was the "national game," Gen. Wood and his staff lent official sanction to its iniquities by almost daily attendance in search of the strenuous life. It is useless for him to say that it was under the authority of the municipality of Havana, for he frequently interfered with the Havana government and had it completely in his power. He could not have been unaware of the demoralizing effects of the game, because he knew it by daily observation. But if he were blind, he must still have known that the Cuban newspapers denounced *jai alai* as the most demoralizing influence in Havana. "The bill limiting the betting in the *jai alai* establishment has been practically abandoned because the Platt amendment binds the Government to carry out the contracts which were approved by the Military Government." Thus a dispatch from Havana in Tuesday's newspapers, printed side by side with Secretary Root's summary dismissal of the charges against Gen. Wood made by Rathbone. We have heard much about the admirable qualities of the Platt amendment. It was to safeguard Cuba from foreign interference, to protect our interests from any fu-

ture ingratitude on the part of the Cubans, and to give us some choice harbors for our navy. Now it appears that, in addition to all its other virtues, this amendment makes it impossible for Cuba or the city of Havana to purge itself of a betting ring with exclusive privileges bestowed by Leonard Wood, representative of American morality!

The remarks of Gen. Adna R. Chaffee at the Methodist Social Union on Friday evening on the subject of the Filipinos were almost cynical in point of frankness. As reported in the *Tribune*, he was not prepared to say whether the Filipinos were our enemies or not. Then he added: "I am an exploiter, and I believe that if we ever get any good out of the islands we must explore and exploit them." Of all men who have had opportunity to know the feelings which the natives of those islands cherish toward us, Gen. Chaffee has perhaps stood in the best position to learn, and it seems that he is not able to discern the friendship which other Imperialist authorities have frequently affirmed to exist since we succeeded in putting down armed resistance. We may assume, therefore, that the state of peace in the islands is of the familiar kind which exists where there are no means of fighting. Gen. Chaffee's frankness is equally commendable in the other half of the quotation, where he says that if we ever get any good out of the islands we must exploit them. We can imagine that the assembled brethren must have winced a little at the thought that we were in the Philippines in order to make money out of them, or that we never should make anything else out of them worth our trouble. We have been assured so many times that our only purpose from the beginning has been to introduce the blessings of civilization and Christianity, and that our chief reward for all the American blood and treasure spent there would be an approving conscience, that Gen. Chaffee's cold remarks to the contrary seem quite shocking. Somebody at Washington ought to "rebuke" him.

Senator Money of Mississippi was at least frank in declaring on March 18 for negro disfranchisement and for the absolute exclusion of colored men from office. He was asked if the South demanded that, and replied that the South made no "demand," but had a "feeling" that negroes should neither vote nor hold office. This is a distinction which colored men in the South will "feel" to be without a difference. Senator Foraker wanted to know if the Southern people were also willing to have their representation of disfranchised negroes cut down, but Mr. Money answered, with a fine Kipling air, that "that is another question." He will find, however, that it is an essential part of the same question. We must, nevertheless, give the Mississippi Senator credit for a certain generosity. He would not shut colored men out of the army. He is quite willing that they should fight for a flag which will not protect them.

Charleston dispatches report that one hundred white men have applied for appointment under the new negro collector, Dr. Crum. Office is the great leveller, after all. It bids fair to break down even race prejudice—that is, prejudice against the race that has clerkships to bestow. Senator Money informed the Senate that the South had a violent and invincible dislike to "sharing" the responsibilities of government with an "inferior race." That, however, was before one of the inferior race had appointments to dispense. As soon as he had them, white men came forward, a hundred strong, perfectly willing to share the responsibilities of government with him. There is evidently a great difference between Dr. Crum, Collector of the Port, and a mere member of an inferior race whose "enfloons wuz powerful lackin'," as Uncle Remus said of the Mud Tukkle and the Spring Lizzud vs. the Elephent.

By linking together his recess appointment of the colored man, Mr. Crum, and the tainted man, Byrne of Delaware, President Roosevelt appears to imply that a like reason constrains him in both cases. But the two are as different as light and darkness. The Senate Committee on Commerce gave no reason for rejecting Crum except the fact that he is a negro. But that is no reason at all. Granting good education and high character, as is done by everybody in the case of Dr. Crum, to allege his color as a bar to office is so preposterous that the President is fully justified in saying that, as long as the Senate is too cowardly to reject the man outright, he will stand by him. But the Judiciary Committee had the best of reasons for its two adverse reports on the nomination of Byrne. It was able to show that he had a wretched professional record in office, and also that he had sold himself body and soul to the most huge corrupter of the age. Either is a convincing reason, and should have been so to the President. By sticking to Byrne, he has, whether he knows it or not, given encouragement to every briber in the land, and, in particular, brought glee to every scoundrel in Delaware. Theodore Roosevelt will be said to have struck hands with J. Edward Addicks, and the President's best friends will not be able to deny the charge. We know, of course, what is said in defence. Byrne is one of Mr. Roosevelt's "good fellows," who has been "useful to me." But there is no surer way of losing character than to cling to good fellows who drag you with them into the Addicks mire.

An interview with Senator Aldrich informs us that he, as Chairman of the Senate Finance Committee, will soon appoint a sub-committee to sit during the recess and prepare a "comprehensive" financial bill. His object is to have such a measure ready for presentation at the beginning of the next session of Congress. This news is gratifying for two reasons: it assures us not only that the controlling forces of the Senate have awakened from the slumber into which they relapsed after the passage of the so-called gold standard act of 1900, but that they intend to go beyond the limits of the Aldrich bill of the last session, which related to the deposit of public money in the national banks, and adopt a more thoroughgoing measure. It is a fortunate circumstance that a committee of the National Bankers' Association, of which ex-Secretary Fairchild is Chairman, will be laboring on the same problems at the same time. That the latter body can give valuable assistance to the Senate Committee, if asked to do so, is evident. That such help would have been useful in perfecting the details of the Aldrich bill of the last session is known to all who have made a critical examination of it, and would probably be admitted by its very author. Another encouraging sign is the fact that President Roosevelt himself has taken occasion to express the hope that the movement initiated by the Bankers' Association may bear fruit for the coming Congress.

Rhode Island is rousing at last from its apathy over political corruption. For many years the citizens have listened patiently to counsels of despair, and have folded their hands in meek submission to the "all wise and unscrupulous" Providence that has fastened the clutch of Boss Brayton on their throats. To-day, they are beginning to struggle against fate. The publication of the infamy of Rhode Island to the whole country is having its natural effect upon the minds of the residents, and they are asking themselves whether in fact they must lie forever with their necks under Gen. Brayton's heel. The position, though undignified, was tolerable so long as the matter was kept private; but the pillory has been too much. Clearly the time has come for a non-partisan movement against bribery. If Bishop McVickar, if the clergy generally, if the professors of Brown University, if other men of light and leading will unite for action, they can count upon all the help that outsiders can give in such a contest; but if they are not ready to move now, Rhode Island must stew in her own juice for a while longer. Honest Repub-

licans and Democrats can surely sink their differences and join in opposing the open auction of laws and offices to the highest bidder. If, in such a fight, decency cannot ultimately triumph, Rhode Island must confess that the republican form of government is a failure.

Of course, the English Conservatives have a large enough majority in the House to lose seat after seat in bye-elections, yet still remain securely in office, but their succession of electoral reverses is greatly damaging to the prestige of the Ministry. People will say that the country is getting tired of the Government, and that it is going stale. Indeed, signs multiply that such is the fact. All the more importance, therefore, will attach to the Irish Land bill, of which the long-delayed introduction is now momentarily expected. The fate of the Ministry will be wrapped up in it, since a failure there would almost surely force a resignation or a dissolution. Even as it is, the losses at Woolwich and Rye are facers for Mr. Balfour. He wrote a characteristic letter to the Woolwich Conservatives, urging them not to be content with giving merely a "languid support" to their candidate. This, from the eminently languid Balfour, excited some amusement, which was not diminished when the supposedly safe constituency was lost by 3,000 votes.

No one can deny to Premier Combes the courage of his opinions when he induces the Chamber to suppress in a single vote the schools of some fifty teaching orders. Such wholesale treatment of very different cases had already aroused the protest of the moderate press, and M. Combes's substantial vote of confidence must be taken as a distinct sign of a revival of anti-clericalism. The basis of the vote was an elaborate report on the status of fifty-four men's religious associations that had applied for authorization under the Associations Law of 1901. Most of these teaching congregations, it is fair to note, are contumacious. They have stood upon alleged previous authorization and have complied with the new law only under duress. The report of M. Fernand Barbier, which was accepted on March 18, took up these cases one by one, and usually decided that these orders not only are, but for years had been, without warrant of law. While only an expert in French jurisprudence could criticise the report in its legal aspects, in common sense it is obvious that congregations which have for a hundred years maintained a public existence cannot properly be suppressed for irregularities of long standing. All the historical portion of the Barbier report, while doubtless of great value, gives the impression of an anti-clerical tract.

Premier Combes, in defending the report, took the high ground that the teaching in the schools of these orders is anti-republican. He appealed to old hatreds of the priest, and to the people against the aristocracy and bourgeoisie, and his policy of thorough proscription undoubtedly is popular for the moment; but there is an uneasy sense that he has taken Waldeck-Rousseau's programme too literally, and that the Associations Law would be more comfortably enforced by its original promoter. It is probable that M. Waldeck-Rousseau, who is at present occupied with his candidacy for the Academy, is, at heart, of this opinion. It remains to be seen what evasions of the Associations Law are possible and whether Premier Combes, as is probable, will be as persistent in ferreting out nominally secular bodies that will attempt to continue the work of the monastic schools, as he has been successful in rebuking the religious orders themselves.

We should be glad to believe that the great Parisian factory of ancient works of art has been unearthed, and a check administered to the business. It is certain at least that extensive fabrication of modern paintings has been discovered, and that the scandal reaches even to the Louvre, where, among other objects of supposed antiquity, the authenticity of the famous and costly "crown of Semiramis" has been put in question. Forgeries of ancient goldsmiths' work are of a peculiarly insidious character, and it may be recalled that some of the handsomest pieces in our own Metropolitan Museum cause connoisseurs to wag their heads sorrowfully. Such incidents as that at Paris show that the requirement of skill in museum curators must be considerably increased. The forgers can be beaten only by a connoisseurship superior to their own dexterity. The best curators will be deceived at times, but as forgery becomes more and more a fine art and an established industry, only the best will be tolerable. We may call attention also to a request in the current number of *Les Arts* for a museum of registered impostures and fabrications. Such an institution would not lack utility, and every great collection, by a careful weeding process, could easily start such an exhibit on a sufficient scale—from its own store.

Chancellor von Bülow's defence of his recent foreign policy, in the Reichstag on Thursday, will at least add to the gayety of nations, and will do nothing to impair their comity. In the Venezuela matter he insisted that the Government had acted with dignity and wisdom, but he refused to commit the Empire to an identical course in any similar case which might arise. Some very pungent comment on Ambassador Speck von Sternburg's amiable indiscretions, which culminated in the very happy characterization of that nobleman as Germany's "Expiatory Envoy" to the United States, produced the retort that Von Bülow had denied the accuracy of the Sternburg interview in the *North German Gazette*. It is evidently in this semi-official organ that one is purged of folly, and wisdom is justified of her children. Answering captious criticism of Baron Sternburg's choice of an American wife, Von Bülow neither affirmed nor denied the propriety of such a match; but when he quoted Bismarck as saying that, in a previous instance, to refuse permission to a German diplomat to marry an American "would exercise an extremely unfavorable influence upon our relations with the United States," he showed a deficient sense of humor.

Of a more serious character than Von Bülow's genial apology for his official course is the report that Germany and Great Britain will try to prevent any reference of the Venezuela dispute to the Hague Tribunal, and will resume direct negotiations with Venezuela. In any case, their temper is such that Minister Bowen, as plenipotentiary for Venezuela, has had to remind these two great Powers that the preliminary cash payment, due April 1, will not be made until the protocol referring the question of preference to the Hague Tribunal has been signed. Mr. Bowen would hardly have taken so unusual a course without grave reasons. The fact appears to be, first, that Germany is none too friendly to an international arbitration court which is in a sense superior to the Empire; secondly, that a large class of the Venezuelan claims—those of the Disconto-Gesellschaft were ridiculed last week in the Reichstag—would hardly bear the scrutiny of an impartial court. It is probable that some of the German creditors would prefer any kind of cash settlement to a judicial finding. But it would be highly unfortunate if so interesting a question as that of international preferential claims—one that the jurists of the Hague Tribunal are eminently qualified to settle—should fail of an authoritative decision. Aside from this, the attempt to go behind Mr. Bowen's settlement would inevitably create an impression that the claims of England and Germany were doubtful. It may well be questioned if Venezuela will consent to the reopening of the negotiations. Her interest is that of all the smaller nations—to enhance the authority of courts of arbitration. Direct dealing with greatly stronger Powers is always terminable at the will of the stronger, and, as the Venezuelan case itself shows plainly, the dénouement tends to follow the fable of the wolf and the lamb.

THE STRIKE VERDICT.

In weighing the report of the Anthracite Strike Commission, we have to look both at the case it had in hand and the general attitude and demands of organized labor all over the country; both to immediate results and remote effects. And, first, we note with pleasure the emphatic way in which the unanimous Commission arraigns the Mine Workers' Union for acts of intimidation and violence, culminating in murder, denounces the boycott as an illegal and abhorrent weapon, and vindicates the rights of free labor. This is a splendid body of doctrine. It goes to the root of union tyranny. We expected no less from a Commission on which sat such outspoken men as Judge Gray and Bishop Spalding. "A labor or other organization whose purposes can be accomplished only by the violation of law and order of society, has no right to exist." Those are golden words. To have had them thus authoritatively uttered is of itself cause for gratitude to the Commission.

Along with this clear and high denunciation of the Union's methods goes the practical granting of its demands. The men get their 10 per cent. advance in wages. Their hours of labor are, at the same time, cut down. In the matter of checking and "topping" coal, as also of car distribution, the Commission appears to have gone nearly the full length of the miners' demands. They have won what the operators vowed they could not possibly concede. Whether these can yield it now without permanently increasing the price of coal, remains to be seen. The steadiness of the "coalers" in the stock market, in face of the advance in wages for mining which the Commission's report provides for, is pretty good evidence that the operators believe that they can recoup themselves in some way from the sales of coal. In other words, they can take the 10 per cent. increase out of the consumers. This is not at all unlikely. They may even take more. The shortage of last winter has led people to look upon coal at any price as a benefaction. Householders are no longer disposed to higgle over such small differences as twenty-five or fifty cents per ton. Thus the element of personal resistance to an advance in price, which has heretofore been formidable, has largely disappeared. Public opinion is now ready to concede something in this direction. The purely economical side of the case is the question how far anthracite is indispensable—that is, not liable to be superseded by bituminous coal. We may assume that the producers of anthracite will, if they have not already done so, form a combination sufficiently strong to put limits upon competition among themselves. Then it will be a matter of experiment how far the producers of bituminous can penetrate into their territory. The higher the price of anthracite, the wider will be the door for bituminous to come in. At some future time society may have to reckon with a combination between the anthracite and the bituminous interests, but nothing of that kind is possible now. The law of competition will soon decide whether the advance of wages in the anthracite field can be taken out of the consumer or not.

The report intimates that the Union is founded on a bad system, which makes it difficult for the operators to bargain with the leaders. The Commission also discredits the assertions of the miners that conditions of life in the anthracite region were intolerable, and that wages were shockingly low by comparison. The excuses put forward for child labor in the mines are riddled by the report, of which a very significant paragraph is that which concerns the status of minors in a union. The Commission says: "We believe it is unwise and impolitic to permit boys of immature age and judgment to participate in deciding the policy and actions of a labor union. We think no one should have such a voice in the affairs of a union until he has reached his legal majority." In this opinion the Commission virtually condemns the ordering of the late strike. It is notorious that the older miners were against the strike, and that the Hazleton Convention was in the hands of delegates elected by breaker-boys, whose votes made up the majority for the strike. These youthful unionists voted quite as much in the interest of a holiday and a scrimmage as in behalf of the rights of labor. They were throughout the strike a very dangerous element. Their mischief-making readily passed over into rowdyism, and created an atmosphere of disorder in which criminal outrages became possible. A history of the strike which omitted to mention these breaker-boys as an irresponsible element in the union, and as constant fomenters of violence throughout the strike, would be lamentably incomplete. So would the Strike Commission's report have been if it had failed to point out this inherent viciousness in the organization of the United Mine Workers.

We fear that this organization will shed the Commission's rebukes like so much water. "That is all right," they will say, "but we have our increased wages and shortened hours and the practical recognition of the union, just the same." It was in order to secure these results that they created a reign of terror in the coalfields last summer, boycotted men, women, and children, and clubbed and murdered independent laborers. Without violence, without the boycott, they would not have succeeded. The Commission practically admit this. Which, then, are the miners most likely to take to heart—the fact that their plan of terrorism and blood won a victory for them, or the other fact, that they are severely reproved at the moment of triumph? What is likely to be the net effect in Waterbury, or among the New Haven and other labor unions contemplating a strike? To us it seems probable that shrewd labor agitators will see in John Mitchell's success a plain hint to do as he did—that is, publicly deprecate violence while doing nothing to stop it and allowing his locals to have full swing; to draw the boycott tight, and to denounce non-union men as enemies of their class.

Contributory to this we must regard the Commission's visiting with an equal censure the stubbornness of both sides in holding out to so great a pitch of public anxiety and distress. In view of its present findings regarding wages and other relations, those who before held the operators to be exclusively to blame for the coal crisis, will be confirmed in such condemnation. The truth is, however, that these findings have no bearing whatever on the question of the operators' responsibility. The differences between them and the Union were subjects for arbitration undoubtedly; but unless on the assumption that a strike is presumptively just, there can be no escape from the burden of the famine resting upon the shoulders of those who ordered the strike of May last. They created the situation which hourly grew more perilous; and if the peril became a reason for the operators' yielding, then the assailed must be for ever in the wrong, and the assailants need only be persistent enough and heartless enough to persuade the suffering public in the end that the oppression is all on the side of their victims. Nor must it be forgotten that the operators were not unwilling to discuss grievances with their own people, and that the Commission does not condemn them for not recognizing the United Mine Workers.

As for the particular and most difficult arbitration referred to the Commission, the solution arrived at has much to commend it. In the first place, the settlement is to be for three years at least. For that length of time we shall be free from the convulsions and alarms of last autumn. Next, there is provision for a board of conciliation, to hear and determine any disputes which may arise about the interpretation of the award itself, or other controversies between miners and operators. Obviously, there is here the germ at least of a system of permanent arbitration, and the doing away with the old chronic state of warfare in the coal regions. Thanks are due the Commissioners for their patient and truly disinterested labors.

THE ISTHMIAN CANAL TO-DAY.

The vote in the Senate ratifying the Isthmian Canal Treaty assures the world that the work of uniting the At-

lantic and Pacific Oceans by a canal of sufficient dimensions to admit the passage of the largest ships afloat will be accomplished within a measurable time. As no such assurance has ever been given to mankind before, we may fairly point to the Senate's action as an epoch-making event. It may be interesting at this juncture to see what the United States has bought for the $40,000,000 which we are to pay to the French Company for its holdings in the Isthmus of Panama.

The International Technical Commission of 1898 reported that the De Lesseps company received from the sale of its securities $260,000,000, that there had been actually expended on the isthmus the sum of $156,400,000, and that of this sum $88,600,000 had been laid out on the work of excavation and embankment. The difference between the two sums last mentioned represents the purchase of the Panama Railway and other expenditures which, if not really necessary, were inevitable at the inception of so vast an undertaking. Thus was gained a great deal of experience of a costly nature which will not be necessary to acquire a second time, but which may be properly reckoned as a valuable asset to any party buying the property with a view to its completion. It is quite within bounds to say that what we have bought is worth more than we shall pay for it. And if it be true, as some of our foremost engineers believe, that the De Lesseps route is the only practicable one for a canal between the oceans, then our bargain is so much the better. The estimate made by our own commission of the value of the property as it stands was exactly the amount that we are to pay, but, of course, they were bound to make the best possible terms for their own Government.

The extreme length of the canal is forty-six miles, of which nearly one-half will be at sea level. Eighteen miles have been already completed, and the intervening higher lands have been materially cut. It was the opinion of the international commission that two-fifths of the whole work has already been done. The original intention of De Lesseps was to make a sea-level canal, but this plan was abandoned as too costly. A system of lockage was adopted which will be followed in the future progress of the work. According to this plan there will be eight locks between Colon and Panama. The commission reported that there was nothing in the physical conditions of the isthmus to prevent a change from the lockage system to a sea-level canal if the latter should seem desirable in the future.

The only engineering problems of great importance on the Panama route are the Culebra Cut and the floods of the Chagres River. The summit cut at Culebra is nearly eight miles long, and at the highest point the bottom of the canal is 286 feet below the natural surface of the ground. A considerable part of this work was done before the De Lesseps company failed. The material to be excavated consists of an indurated clay. Much difficulty was encountered by the French engineers by reason of the sliding of the hillside as the cut proceeded. It has been ascertained that this was due to the saturation of the ground, and that when it is properly drained it stands firm. As regards the Chagres floods, the report of our commission says that they can be controlled by a dam at Bohio, and that the retained waters will be useful in operating the canal in the dry months.

The cost of completing the canal as estimated by our own commission, of which Rear-Admiral Walker is President, is $144,233,358, and the time necessary to do the work ten years. Assuming that the Colombian Government promptly ratifies the treaty, the work of excavation can be resumed where the French company left it, in about eighteen months.

When the De Lesseps company failed, it was apparent to everybody that the work of piercing the isthmus was too great to be performed as a private enterprise or by any government except a very rich one. M. de Lesseps brought to his company every advantage that a private undertaking could enjoy. As the builder of the Suez Canal, he had acquired a prestige not enjoyed by any other engineer, living or dead. The financial results of that work had been dazzling, and had excited the imagination of the French people in a high degree. Patriotic pride, too, largely entered into the Panama Canal. It was believed that France could do anything that her great engineer should advise, and she could undoubtedly have completed this great work if the French Government had lent its own credit to the undertaking. But it was not within the compass of volunteer effort, and it would probably not be so now, even if the threat of a competing canal were not held over it.

The Nicaragua Canal may now be considered defunct. Whether it was originally begun like the De Lesseps enterprise as a bona-fide attempt to build, by private means, a waterway 183 miles long and large enough for modern steamships, or whether it was intended from the start to sell it to the Government of the United States, it is abandoned by all men and governments. We shall probably see bills introduced in future Congresses to pay the heirs and executors of the Nicaragua Canal for the work they tried to do.

THE CASE OF MAJOR PLIMLEY.

In the saving—yet so as by fire—of the public service from the calamity of having Major William Plimley made Assistant Treasurer, there is matter for reproof and instruction, as well as congratulation. The appointment was one which should never have been made. The nominee was scandalously unfit. His record in other offices in this city was such as to disqualify him absolutely for a position of delicate responsibility, like the Assistant Treasurer's. Not to put too fine a point upon it, Major Plimley was perfectly well known by bankers and others to have used, or to have attempted to use, his public office as a means of private pecuniary gain. Operations that would not bear public scrutiny characterized his career in the Post-office and as Commissioner of Jurors. These facts having been finally made known in high circles at Washington, the shrieking absurdity of Major Plimley's appointment to the Treasurership became apparent, even there.

In this city it was matter of jocose or astonished comment from the first. Business men were complaining that they did not know him. Politicians chuckled over knowing him too well. Plimley has been for years a political rounder and perennial office-seeker. He was long a Platt hack. Latterly he has sunk still lower than that, and become a Quigg hanger-on. The idea of naming such a man, down on his luck, for the important office so long filled by the late Conrad N. Jordan, would seem one that could never have occurred to people out of bedlam. Yet he was not merely appointed, but confirmed by the Senate; and it was only a lucky chance that revealed to the Finance Committee and to the President how grossly they had been deceived. They found out their mistake in time, but how did they ever fall into it originally? Under what sort of political system do we live when a roving political adventurer like Plimley can come so near getting into one of the most important offices in the gift of the President?

Mr. Roosevelt cannot be held blameless in this matter. He was deceived, no doubt, in the character of Plimley, but he had no business to be deceived. He is too old a bird to be caught by Platt's chaff. It was his duty to go behind the recommendations of that veteran debaucher of the public service, and of his dummy Depew, and to inquire who and what manner of man it was they were asking him to appoint. Half a dozen letters to friends in this city would have brought him full assurance of the worthlessness of the nominee. The President set about filling the office of Assistant Treasurer in the correct way. He looked for a man well known in the business world. The position he first offered to Mr. Sheldon, then to Mr. Bacon. Both declined, and then Mr. Roosevelt, apparently in a fit of impatience, turned to Platt. That worthy, of course, had a man up his sleeve, and promptly pulled out Plimley. The Pres-

ident took him, evidently without due investigation, on the theory, as it was explained, that it was "impossible to find a $30,000 man for an $8,000 job." But that was no excuse for taking a thirty-cent man for it.

This notion that every honest and capable man in New York is earning from $20,000 to $30,000 a year is flattering to our pride, but we fear that it would break down on oath and under severe cross-examination. We are acquainted, of course, with the "sacrifice" which lawyers make when they give up their practice to take a judicial salary of $17,500; and yet we are credibly informed that there are some good lawyers in this city who make a few hundreds less than that. Similarly, we are persuaded that if President Roosevelt had persisted in his search, he could have found a trustworthy and able business man willing to assume the duties of Assistant Treasurer. We venture to say that the Clearing House could have given him his choice of a dozen such. Or, if he found it so difficult to obtain the right man outside, why did he not promote some one already in the Treasury service? Mr. Conrad Jordan rose from the ranks in that way, and his efficiency was all the greater from his having been bred to the business. In any case, it would have been better to leave the office forever vacant than to put into it a shady character like Major Plimley.

The work of the Assistant Treasurer at New York is of extreme delicacy and importance. He has to be in touch with banking interests and to have the whole monetary situation at command. As intermediary between New York financial institutions and the Secretary of the Treasury, it is incumbent upon him not only to be above the suspicion of dishonesty, but to be singularly intelligent and informed, to be able to make rapid decisions, and to give sound advice to his chief at Washington. The part which Mr. Jordan played in the crises of 1893 and 1895 in known only to men on the inside, but it was of the greatest value. To pitchfork a ne'er-do-weel like Major Plimley into an office where such vast financial interests daily interpose, would be to make a mock of the public service. As we have said, it is wholly inexcusable in President Roosevelt to have allowed himself to be so easily tricked in that matter. As for Senators Platt and Depew, the incident only furnishes one proof more that they really care not a straw for the best business interests of the city, and would make a party football of an office second only in financial importance to that of the Secretary of the Treasury. Could Senators elected by the people have done worse?

It is worth recording that one gentleman who furnished the *Evening Post* with conclusive proof of Plimley's bad character, is said to have manifested something like abject fear at the thought of its becoming known that he had done so. He would not have it made public for $10,000. It would mean his business ruin. Such alarm is all too common. It accounts for the increasing numbers of those who come secretly to furnish evidence of rascality, and to bid the fearless editor strike and spare not, but who always wind up with the fervent plea, or strict injunction, "For Heaven's sake, don't mention my name!" This terror-stricken state of mind is exactly the thing which a mercenary and unscrupulous political organization like Platt's aims at producing in society, and especially in the business world. It wants to have the impression go forth that no man can oppose it and prosper. To refuse to sign its petitions; to expose its scoundrels; to dare to stand up in public against its nefarious machinations—that, it would have the community understand, spells ruin. Nor is pretence or bluster its only weapon. It has numberless back-door business affiliations. Able to throw "good things" now and then to favored banks, it gets a hold upon their directorates which it uses without mercy. A pronounced anti-Platt man may suddenly find it mysteriously difficult to get his notes discounted. Loans are called. Business is strangely withheld. The thing cannot be traced, but a sort of financial blight falls upon the merchant or the financier who has defied the machine. The few cases of the kind that actually occur are bruited abroad,, and become multiplied and magnified in the excited imagination of business men. Hence their civic cowardice. Hence the growingly arrogant tyranny of the political freebooters who call themselves the party organization.

THE MORTGAGE-TAX BILL.

The Mortgage-Tax bill wnich has been brewing at Albany ever since Gov. Odell's message was presented, was introduced on Thursday. The last Legislature adjourned on the 28th of March. Unless the present session shall be considerably lengthened, the time for considering this measure will be brief, and not at all commensurate with its importance. We presume that the delay in bringing the measure forward was not due to design, but rather to its inherent difficulties, which are formidable enough to warrant even greater procrastination than has already occurred.

The measure provides for the taxation of mortgages on real estate in New York. The tax is to be levied at the place where the land is situated, and if it is not paid the land is to be sold. If there is more than one mortgage on the property, each one must be taxed, and the property must be sold for a default on either. It is immaterial whether the owner of the mortgage is a citizen of New York or not. His residence may be in another State and he may be taxed there for the same mortgage, in which case the paper security would be taxed in one place, the land security in another, and the land itself would be taxed also against the owner of the fee. And here we have triple taxation.

The right of New York to tax all the tangible property situated within its borders, irrespective of the owner's residence, is not questioned; but its right to tax the claim which a citizen of Massachusetts holds against a citizen of New York is more than doubtful. No such right would be asserted or imagined if the claim were not secured by a particular kind of pledge—that is, by a mortgage on land. If the credit of the New York borrower were good without such pledge, or if he should give any other kind of security, New York would not extend her taxing power over the Massachusetts lender. But it is plain that without this absurd and probably unconstitutional stretch of authority the tax on mortgages cannot be made effective; for if those owned in other States were exempt, while those owned here were taxed, there would be an extensive transfer of that class of securities to other jurisdictions. A mere scratch of the pen—that is, an assignment—would be sufficient for this purpose. So it would be impossible to prepare, or to keep in good working order, a list of taxable mortgages for the use of the public authorities.

The difficulties attending the preparation of the list are formidable in any case. The bill provides that the lien of the tax shall take effect on the first day of July in each year, and that notice of the amount of the tax shall be given in September after the lists have been corrected, and the tax shall be payable at the office of the county clerk or register where the mortgage is recorded. Now what is meant by a list and by the correction of a list? There are probably 100,000 live mortgages and 50,000 obsolete ones in this city. They are recorded in books in the register's office. Only a single person can use a book at one time, and these books are constantly in use by lawyers for purposes connected with litigation in the courts. To make out a list for purposes of taxation a schedule must be prepared, showing ten separate entries: (1) the name of the mortgagor; (2) the name of the mortgagee; (3) the original amount of the indebtedness; (4) the present amount of the indebtedness (which can be furnished only by the holder of the bond accompanying the mortgage); (5) the amount of interest overdue, if any; (6) the amount of the tax as calculated by the register; (7) the amount of the tax after deducting payments of principal already made; (8) date of payment of tax; (9) date of appeal to State Tax Commissioners, or to the courts, if appeal is taken; (10) "remarks." All of these requirements were specified in the

schedule accompanying the Mortgage-Tax bill which was before a former Legislature.

The preparation of such a list is obviously a gigantic undertaking, but the correction of it is even greater. The list must be posted up in the register's office and is to be taken as final unless the holders of mortgages come and examine it and point out errors. Then there will be opportunity for argument between the mortgage holder and the register (who is really the collector of the tax) on disputed points, and when the proper corrections are decided upon they must be entered in the proper place on the same list, since the list of any year will form the basis and starting-point of the list for the next year. This would not be a very onerous task if the number of mortgages to be catalogued were very small, but how would it be in the county of New York or any other large county? Think of the crowds of people who would be thronging the approaches to the register's office, and jostling each other, and waiting their turn to get access to the lists and also to the books from which the lists are prepared. Under the terms of the bill, citizens of other States holding mortgages on property in New York must come or send agents to inspect the lists. If there has been a second or a third mortgage on the property, which has become obsolete by payment, but has not been cancelled, it will be taxed, and then, perhaps, nobody will have any interest to look for such a lien. In such a case the land would be sold for non-payment of the tax just the same. Obsolete mortgages arising from sales under foreclosure are almost infinite in number, but the fact of foreclosure is not shown on the register's books.

These are only a few of the complications certain to arise under the Mortgage-Tax bill. If passed it will introduce endless confusion in the ordinary business of the community, and will probably be found in the end unworkable. When we reflect that it is founded upon a wrong principle, and is condemned, on both fiscal and moral grounds, by the highest authorities on taxation, and has been repeatedly rejected by former Legislatures, we can only wonder whether the present Legislature expects to "jam it through" in the short time which presumably remains of the present session.

CITANIA.

[SALAMANCA, June, 1902.]

In the northwestern part of Portugal lies a district called "Entre Douro e Minho" from its position between those two historic rivers; it is not only one of the most interesting regions of the country, but in many ways the most beautiful. Between the natural richness of its soil and the industry of its thrifty peasant population, the valleys and small plains are literally gardens of greenery in early summer, with a perfect shelter and background of heavily wooded hill-slopes, dotted with towns, churches, and often shrines. Unfortunately, railway communications are slow and uncomfortable—even for Portugal; but the inns, which have the double quality of goodness and cheapness, might well induce a traveller with energies still unexhausted by the conventional, yet undesirably greater, attractions of Alcobaça, Batalha, and Thomar (all lying far to the south), to pause before rushing at Pampilhosa into the "Sud Express" for Paris with the conviction, defensible it is true, that the sights of the country have been done.

This comparative remoteness preserves to Northern Portugal its singularly unspoiled characteristic peasant life, full of color and movement, the only approach to which in Western Europe is possibly to be found in Sardinia. To the archæologist and student of bygone civilizations the whole region offers, moreover, a very peculiar interest deriving directly from the above-mentioned union of fertile stretches with hilly fastnesses, of which the early Celt-Iberian inhabitants availed themselves in the construction of towns, now entirely ruined, but still perfectly traceable on several summits of no great elevation. The most important as well as best known of these goes by the generic name of *Citania;* and as many readers of the *Nation* are probably unfamiliar with Mr. Oswald Crawfurd's 'Portugal, Old and New,' or with Mr. Émile Cartailhac's authoritative work,'Les Âges Préhistoriques en Espagne'—the only commonly accessible books on the subject—I feel some warrant in presenting an account of a recent visit to those vestiges of an ancient people unmentioned in most books of Portuguese travel, and disposed of by the invaluable Baedeker in a short paragraph of small print. Moreover, the latest investigations have rendered details of interest not contained in either of the above special works.

The ruins of Citania, and its immediate neighbor, Sabroso, are situated about midway between the two important towns of Braga and Guimaraes, these last two connected by a truly superb highroad in excellent repair, and for the most part so embowered in vine-swathed trees that the way suggests an avenue in a noble park decked out for some festal occasion. Of the many lovely drives in this district, or indeed in Portugal, none appeared comparable to this for sustained, finished, quiet beauty. The short day's excursion is accomplished in a roomy two-horse landau or travelling carriage for the very moderate price of six thousand reis, which, in the present depreciated condition of Portuguese money, may stand for about five dollars and a half. Add to this the sight of Braga and Guimaraes, quaint with curving streets and balconied domestic architecture so different from the tamely successive white walls and red tiles of the south, and one is more than repaid for the exasperating experience of the crawling *Bummelzug.*

The midway halt of Caldas das Taipas, a local health resort, embedded in luscious foliage, is the starting-point for Citania, at the neighborhood of which one arrives by a fair country road leading to the hamlet of Briteiros, commanded by the small dome-shaped eminence on which the ruins stand. At Caldas, the travelling-carriage is very likely to be encircled by a ring of spectators, interested and even sympathetic. There is, by the way, no more striking contrast between the two countries that compose the Iberian Peninsula than in the very general practical helpfulness one meets with in Portugal as against the indifferent aloofness of bystanders across the nearest border. A proof of this I found in the unusual "traveller's luck" that befell me here. In the midst of a debate as to the wisdom of engaging a local guide and saddle-horse for the side-trip, a stranger came forward with an offer of his services for a thorough visit in return for a lift to the next town. His credentials were beyond criticism, for this *cavalheiro* turned out to be a local land-agent, whose knowledge of Citania had come through several years' service as steward on the large estates of the late Francisco Martins Sarmento, the accomplished local antiquary who, after discovering the ruins, made them known to the scientific world in 1874. A trifle of persistence, with a working knowledge of uncouth Portuguese, thus placed me under obligation to a most efficient guide, whose modesty forbids either mention of his name or ample recognition of the fashion in which he interprets the traditional hospitality of his country.

From the tiny hamlet of Briteiros at the foot of the hill that bulks steadily larger as we spin along the country road from Caldas, bordered with thatched stone cottages and well-tilled fields, two approaches lead to the top. The easier, circuitous path, preferable on all accounts, discloses the intelligent purpose that guided the selection of the site and the construction of the massive fortifications guarding the approach from the less defensible quarter, for after a comparatively easy ascent of twenty-five minutes along the roughish footpath, a sudden turn brings one face to face with the remains of a tolerably preserved guard-wall constructed on the very spot where a *coup de main* from the valley below might have carried the whole eminence. Here, the hill shows rather as a promontory than a detached height, its weakest point blocked by the aforementioned wall, about a yard in thickness and probably between twelve and fifteen feet high in its original state. Like the other constructions of the town, this is composed of smooth-faced blocks of stone of unequal sizes, so fitted together, without cement, as to present the appearance of carefully built masonry; the cleavage of the strata is so clean that stonecutters must have had little more than finishing to do. From about this point the whole crest of the hill is traversed in its length by a narrow paved street, long protected by the rubbish only recently cleared away, for its paving-stones show some signs of wear, but only such as might have been made by human feet, not by beasts of burden. On either side of this narrow roadway are remains of low walls, of the usual construction of the locality, the original height of which can be only guessed at because of the devastation which has left but their stumps standing; one or two courses alone remain. Stepping over these, we find scattered about the plateau clusters of foundations of buildings, some circular, some oblong, in shape, which it requires no great effort to recognize as having once served the purposes of the early inhabitants

either as dwellings or as storehouses; to the question of their designation I shall presently return.

Close to the middle of the hilltop stands what my guide indicated as the mouth of the public fountain of the settlement, a rough opening of the same sort of primitive masonry, several of the stones of which show signs of much rubbing. On examining them, there came into my mind the well-curb at S. Gimignano, worn into gutters by the friction of bucket ropes of many successive generations. Near by, a fairly regular ridge of the same closely fitted stonework carries all along its upper surface for many yards a carefully grooved runlet, which cannot have been anything else than the tiny aqueduct supplying the wants of the settlement. But much the most curious, as well as significant, discovery since the publication of the authorities mentioned above is that of an opening which in the plains would probably be passed carelessly by as that of an old well. Taken into account, however, with the existence of another aperture eight or nine hundred feet below, and a full half-mile away on the bank of the little river Este, it suggests, as my guide said, one of those strangely laborious tunnels through which the primitive inhabitants of hill-cities used to guard against the cutting-off of their water-supply in a state of siege. One can only wish for time and means to make a thorough exploration, though I understand arrangements are already made for following up the passage from the river end, which is clear for some little distance. The importance of this point in deciding the nature and purpose of the ruins, it is hardly possible to overestimate.

Another interesting feature, before we pass to the ruins proper, is the presence, in somewhat striking abundance at irregular intervals over the top of the hill, of conical stones ranging in height from one to about three feet. No one can fail to observe them, but what they were meant for is a strange puzzle. As Mr. Crawfurd says, if they occurred in the Far East, there would be no doubt as to the part they played in religious worship; but these cartridge-shaped objects among primitive Celt-Iberians can hardly be supposed to have fulfilled such functions. Besides, their great numbers weaken any such conjecture, for they are scattered all about, intact or broken, and must have been originally abundant enough to furnish at least one specimen for every building in the place. It must also be noted that no single structure on the hill gives ground for the supposition of a temple or place of worship. The hypothesis of the "totem" seems either not to have occurred to any of the European investigators, or to have been dismissed with silent contempt.

Much the most important point remains yet to be examined, namely, the real nature of the buildings themselves. So far as guesswork can help us, there is reason to believe that their original height did not, as a rule, exceed eight or nine feet; and through the labors of Sarmento two of them were some years ago reconstructed in accordance with that belief near the edge of the steep face of the hill commanding all the lower valley. Most of these buildings are, as was said, circular, with an average diameter of, perhaps, twelve feet; none that I found the opportunity of measuring came within near approach of Mr. Crawfurd's "twenty-one feet in diameter." The oblong ones are comparatively few in number. The thatch, which, according to some authorities, originally formed the roof, might easily have been supplied from the fields below, and the continued use of the same substance for the farm-houses of the neighborhood certainly gives color to this conjecture; yet the fragments of tiles which, till within a few years ago, were found in quantities strewn about among the ruins, would seem to point to a different kind of covering. Within recent times, the cleaning processes of archæologists have removed all these broken shards in part to private collections, but also in sufficient amount to the local museum of Guimaraes to give one all the data desirable for inference. When I saw the place, most of the interesting parts were as clean-swept as a well-kept private yard. From the spot where the remains are thickest, the descent is extremely abrupt, a short ten minutes being sufficient to bring one to Briteiros once more.

That these singular ruins were placed for safety at the summit of this precipitous hill, guarded on the accessible side by the stout defensive wall, cannot be doubted for a moment:

> "In yon straight path a thousand
> Might well be stopped by three."

But it seems to myself extremely improbable that the buildings, circular or oblong, could have been (as some authorities hold) nothing more than storehouses for grain or other valuable produce. The selection of secure heights for constant dwelling purposes is one of the most natural of primitive dispositions among people almost daily exposed to the risk of hostile raids. That the buildings, crowded together in irregular array, were unsuitable as houses, can hardly give pause to any one who observes how little the state of domestic promiscuity affects the huddled populations of the humbler type, whether within or without the pale of civilization. Nay, that very form of social compression serves as a convenient means of prompt communication when danger threatens. And the comparatively recent discovery of the fountain-mouth, the small aqueduct, and the subterranean passage would give marked support to the opinion that Citania was properly a town.

But this hill is by no means the only one on which such remains may be found. A few furlongs away is another, on the summit of which there may still be seen the vestiges of a settlement to which is given the name of Sabroso. A chance acquaintance, professedly familiar with the greater part of the Minho province, assured me that during sporting expeditions he had in several places come across fragments indicative of similar occupation which are only waiting for the explorer. All of these bear the same general characters, but it is evident that they do not all belong to one period, for the quality of the masonry is found to differ here and there, while the much less ancient date of some of them can, as in the case of Sabroso, be established through the unmistakable signs of Roman influence on the objects found among the ruins. The small local museum at Guimaraes makes this clear at the most casual glance.

As to the state of civilization attained by the inhabitants, it is sufficiently attested by the various articles of glass (such as beads), pottery, and iron implements, which, in the case of Citania at least, have all been removed, classified, and ticketed. The arts of ornamentation, too, were not neglected. There may be found at various points well-cut large stones bearing on their edges a carved moulding, the pattern of which resembles an ordinary woven rope, the strands being imitated very fairly indeed; this is reproduced by clever Portuguese stonecutters in the pedestal of the monument now in process of construction to the memory of Sarmento. Also, rude stone images exist, such as representations of domestic animals much like the attempts of ambitious schoolboys; so that in one case there is some doubt as to whether the design was meant for a nondescript dog or an abnormally lanky pig. One elaborately carved stone, of huge dimensions, has had the unusual fortune of serving as a crux for archæologists and of migrating in a totally unprecedented manner. This is the celebrated *Pedra Formosa*. It is a great slab of dark red stone, about nine feet by five, and more than one foot in thickness, of which the upper, tolerably smooth surface is cut into curious patterns of long parallel grooves radiating from holes bored through or nearly through the whole mass, the under surface being left in the rough. From the positions of these holes and grooves it has been somewhat hastily conjectured that the Pedra Formosa in its original situation was placed horizontally and served as a sacrificial altar for human victims; according to this hypothesis, the holes were resting-places for various parts of the wretch's frame, while the grooves were gutters for collecting the flow from veins or arteries opened at various points on the body. It does not seem to have occurred to the authors of this explanation that a more accurate correspondence in these designs with the average proportions of the human frame might lend support to their conceptions. What this stone was meant for, in short, nobody has any real knowledge. Its changes of habitat have certainly been exceptional. For centuries it lay on the top of the hill, as old Portuguese authorities, ignorant of the other ruins, testify, until an enterprising parish priest, some generations ago, induced his flock to transport it to the porch of the small chapel of Saint Stephen, near the bottom of the hill, where it again remained undisturbed for some time. Sarmento, however, with true archæological zeal, had it again taken up the hill at enormous expense, and placed in one of the reconstructed buildings; but the constant chippings of natives and tourists induced the final removal to the museum at Guimaraes, where any one may examine and theorize over it under the eye of a stern custodian.

Much the most interesting problem that offers itself for solution when one is among these ruins,

> "Sitting at the doorways of a day of long ago,"

is their antiquity, and the cognate question of the race of the builders. On both these points archæologists, Portuguese or other, have written abundantly, with the usual amount of more or less temperate criticism of divergent views. The first formal notice of the discovery, communicated to the Royal Academy of Sciences at Lisbon by the

Marquis de Souza Holstein, in 1876, is by no means decisive, for at that time investigation had not yet disclosed the variety of manufactured objects sufficient to furnish sound ethnological inductions. In the following year a somewhat discursive pamphlet by Simão Rodr. Ferreira, Oporto, sought to prove the Celt-Iberian origin of these remains—a conclusion virtually accepted by all the leading authorities today. It is worthy of note that at a famous gathering in Citania, which in 1880 brought together such men as Virchow, Henri Martin, and Quatrefages, the testimonials to Sarmento as discoverer discreetly avoided stirring up the dust of controversy, and confined themselves to those forms of elaborate compliment with which scientific men are wont to cheer one another's labors. But iron tools, glassware, pottery, and carved stonework, combined with an entire absence of flints of any sort, will be considered amply indicative that the builders belonged to no extremely remote antiquity. Nothing yet discovered (so we read) discloses any sign of Christian influences; but in the carefully sifted object-records of Sabroso several investigators have agreed in recognizing contact with the early Roman occupation of Northern Iberia. It seems, therefore, reasonable to suppose that these primitive inhabitants may have continued to occupy their fastnesses, with but little molestation, until the crowding in of more warlike populations brought about the gradual decay of an altogether peculiar set of local customs, partly by forcible conquest, partly by the assimilation with their conquerors of a population mainly agricultural and hence peaceful.

To-day, the site of the ancient town still commands a lovely view, probably little changed in its main features since, centuries ago, the unknown people looked down on the cheerful valley and across the ribbon of the river to the higher mountains beyond. Of their inheritance, the Portuguese peasants of the north know nothing, though traditions and legends concerning the vanished race might yet be found by the student of confused folklore. It would be a pleasing task to trace back through all those ages the persistence of a racial trait of the Minho province in the prevailing cheerful spirit of industry and thrift. P. T. L.

Correspondence.

PROTECTION GONE MAD.

To the Editor of The Nation:

Sir: The Austrian Reichsrath for some time has been considering, and by this time probably has passed, a measure so hedging about and so restricting peddling, and making the penalty in case of non-compliance so exorbitantly high, that the 16,000 peddlers of Austria and its provinces are practically deprived of every means of earning a livelihood. For, of course, most of the peddlers are past the age in which a new trade can be learned, and, besides, there are such obstacles around the learning of trades, the "civilized world" over, that the peddlers could not learn any trade if they wanted to do so. This bill is a provision for the protection of the storekeepers, and was introduced at their instance by Deputies anxious for reëlection.

One would think this the "ultima Thule" of protection, the last possible limit to which the highway robbery gently termed "economic fallacy" can be extended. But not so; there is one more step. It was reserved for the Austrian Reichsrath to achieve it in another bill—at the present writing a duly enacted law—making it unlawful for sempstresses and embroiderers of white goods to sew for customers in any place other than a factory. Sempstresses are forbidden under penalty to work in their own homes, or in the homes of their private customers.

The first bill protects the storekeeper against his *fellow-countrymen;* the second, a law, still further narrows the "protective idea," protecting the manufacturer of white goods against his *fellow-townspeople.* The class of people hit by this second bill consists almost entirely of widows and orphans. But then, whither are "people's representatives" drawn by their hearts if the choice is between widows and orphans on the one side and "infant capital" on the other?

While penning these lines I hear that the national organization of the journeymen tailors of the United States tries to compel the Toledo union of journeymen tailors to work in back shops. The circumstance that the national organization tries to impose the will of the local minority, desiring back shops, upon the local majority of journeymen tailors opposing back shops, is in itself remarkable, and an instructive sample of the brand of liberty to be expected from labor unions. But this case has another very puzzling aspect. The national organization of journeymen tailors intends to forbid all unions of journeymen tailors to work in their homes, and wants to compel them to work in the back shops attached to merchant-tailoring establishments. And, save a few exceptions, the unions are submitting to this order. Now, although there are some circumstances that do in a slight measure soften the contrast between what is a desideratum to a Viennese sempstress and an American journeyman tailor or tailoress, yet what a paradox! American tailors trying to bring about conditions that the Viennese sempstresses are straining every nerve to avert! Joseph Dick.

Toledo, March, 1903.

BOOKER WASHINGTON IN RUSSIA.

To the Editor of The Nation:

Sir: In the following paragraphs taken from the *Revue des Deux Mondes* for February 15, the writer draws a comparison between the Russian serfs and our Southern slaves, and points hopefully to a common line of advance.

"Par la suite aussi, les seigneurs développèrent chez leurs serfs l'adresse des doigts en leur faisant apprendre tel ou tel métier. Beaucoup de maîtres agissaient de même en Amérique à l'égard des esclaves pour leur donner plus de valeur. Des deux côtés, l'esclavage se trouva donc être une initiation à l'industrie. Et à ce propos je mentionnerai la très intéressante lettre d'une dame russe qui, après la publication dans la *Revue* d'une étude sur Booker Washington, me pria de la mettre en rapport avec le promoteur nègre des études industrielles; 'Je voudrais lui dire,' m'écrivait-elle, 'combien me frappent les traits de ressemblance entre son peuple et le mien; l'esclavage sans doute en est la cause; je voudrais lui faire remarquer que l'apparition des mêmes idées et de la même manière de traiter les mêmes questions aux deux extrémités du globe est la preuve incontestable de la conformité de ces idées, de leur justesse, et le garant de leur réalisation future. Les idées sont comme des épidémies; elles gagnent le monde insensiblement et apparaissent tout d'un coup, sans indices, sans annonces quelconques, dans des lieux différens; elles donnent à penser que c'est la marche historique des choses qui les fait naître et qui nous amène à croire en elles.'

"N'est-il pas curieux de voir une propriétaire russe envier pour son pays l'Institut nègre de Tuskegee (Alabama), et une correspondance s'établir sur des questions de pédagogie très spéciale entre deux personnes dont la race et l'origine n'ont rien de commun? Peut-être, si les moujiks savaient lire, n'en seraient-ils pas très flattés." C. E. W.

Buffalo, N. Y., March 20, 1903.

ABOUT CULTURE AND COMMONNESS.

To the Editor of The Nation:

Sir: It is because of too great a preoccupation with the merely useful that our age is hastening toward mediocrity. In this country there are many factors making for commonness, and few, in comparison, making for culture. Let us examine the situation and see if this be not the case. Is education, as understood by most, and as it is used in common parlance, synonymous with culture? According to Matthew Arnold, it is not, and Matthew Arnold has given us a very satisfactory definition of culture. Let us draw a comparison. Architecture is called by some a fine art, but that does not make it a fine art. Rather it is the materialization of fine art. Fine art is devoid of utility. In architecture there is utility. Now we can see how education can be likened to architecture, while culture can be likened to fine art.

In the smaller colleges the aim of the student is education for utility's sake. In the universities the greater number are seeking utility. The graduates are to be professional men or journalists or engineers, and are aiming at financial success. This is education as Americans understand it, as they worship it. "The disinterested pursuit of perfection" is for the few, and is so undemocratic, so opposed to the utilitarian standards, that "education" almost taboos it.

Matthew Arnold divided the English people into three classes—barbarians, philistines, populace. We should not go so far wrong as to be misunderstood if we were to divide the American people in like manner and use the same titles. Our upper class, or barbarians, do not count for culture; they count for utility attained and used ostentatiously. Our philistines, instead of engaging in the disinterested pursuit of perfection, are very interestedly pursuing philistinism. Our populace, separated by no impassable barrier from philistinism, are reaching toward it, and may attain it. Gladstone once said the English people had made a kind of religion of inequality. We have made a religion of utility, and this is why we have much commonness and little culture.

Let it not be understood that I am belittling our colleges and universities. They are doing a great work, but they have a great work to do—a Herculean task. They are our only safeguard against the vulgarity of an ever-increasing populace. If the result is commonness, let us remember that commonness is superior to vulgarity. Cul-

ture we have, and, upon the whole, much of it, but it is so diluted with what we cannot call culture that the result is commonness. J. A. BARTHOLOMEW.

NAPLES, N. Y., March 20, 1903.

THE CERTIFICATE SYSTEM.

TO THE EDITOR OF THE NATION:

SIR: On Friday and Saturday, March 6 and 7, a large number of teachers in preparatory schools came together at Brown University to discuss with the faculty certain aspects of college entrance requirements—in especial, the certificate system—and to form a "Brown Teachers' Association." Several papers were presented by members of the college faculty and by preparatory teachers, a more or less desultory debate followed, and the association was formed. The precise nature of the work it will do is still a little vague. But that it can be widely and variously useful to both the college and the schools is undoubted.

While its precise lines of action are yet vague, it may not be out of place to suggest that the most important task before it is not the holding of more or less acrimonious debates, but the inculcation of a somewhat different attitude on the part of the school teachers towards the university and its requirements. For the present conference but seems to confirm a fact often noted before—that teachers, in many cases, do not come to these conferences to hear what the colleges wish them to do, but to protest against the standards and the methods of the colleges. Sometimes the protest is outspoken; oftener it forms an easily discernible undercurrent of bitterness. In the present instance, it was noteworthy that the only one of the prepared speeches made by school teachers which took the attitude that the university was the final arbiter in the matter of the entrance requirements, received but slight applause, while a speech which contained a hardly veiled threat was loudly clapped.

In substance, this threat was as follows: If the colleges do not recognize that the key to the situation is in the hands of the schools, the schools can—and the speaker's tone implied *will*—cut off the supply of students. To support the right of the schools to join in settling the nature of the college entrance requirements, this speaker, in company with others, dwelt on the fact that the public-school curriculum is not constructed solely for future college students, and that the colleges cannot expect changes in the public schools to suit the college requirements. Rather, the colleges must change their requirements to suit the schools! One may well query whether, if the exigencies of the public schools are to settle what the colleges are to require for entrance, the colleges should not construct their curricula solely on the basis of the training these schools afford. Shall we then see Chemistry I. in X College eliminated because it does not follow coherently the kind of chemical training thought best in the Y High School?

The fatal misconception of the relation of the colleges to the schools which underlies such a view is evident. Here in the East at least, our colleges are not the last steps in a vast public-school system, but private institutions, admission to which is to be regarded, not as a right, but as a privilege, and a privilege which must be carefully guarded by the authorities of the colleges. If the course in a given school does not meet the demands set by a given college, the school may, of course, hope for changes in the requirements, but it cannot confidently demand changes unless it can show the requirements to be wrong in themselves. To many teachers, both in the schools and in the colleges, it seems axiomatic that if the certificate system is to endure, it can only be by means of an eager desire on the part of teachers to learn just what the colleges which grant the certificate privilege desire, and to meet those requirements. Any attempt to force the colleges into accepting whatever the schools desire to present must, sooner or later, result in disaster for the certificate system.

The question of the permanency of the certificate system was designedly excluded from the present meeting, and the teachers who came from one of the largest and best preparatory schools of New England to speak in favor of entrance by examination found their ground cut from under them. Yet there are signs, not the least of which is the formation of an association of colleges to control the schools that give certificates, that the certificate system is not working entirely well, and that the school mind is querying as to the future of the system. In the meantime, many college professors, rightly or wrongly, will interpret about as follows: "You school teachers admit examinations to be good, for you say you do not grant certificates to pupils who fail to pass your school examinations; but you object to preparing pupils for an examiner who doesn't know just what you've said and done." This is not an unnatural attitude. Most professors would hardly desire to submit their students to their colleagues for examination. Yet it is surely within the bounds of possibility that many college courses would be better taught if that were the rule. And here, after all, is the root of the matter. It is not very important that this or that faculty should feel that its dignity has been injured by sharp comments, or that this or that teacher should be unhappy because his pupils have failed to pass tests set by a college examiner; but it is of vital importance to know whether the certificate system has improved the preparation for college.

I say "improved," because, while its opponents assert it to be a mere crutch for the lame and the lazy, its supporters assert its superiority to any other conceivable method. In discussing this point, we have heard, *ad nauseam*, from both teachers and professors. Why not consult the only other persons concerned—the students? The testimony of a boy in a preparatory school will inevitably be that it is a fine thing to get out of the examinations. The same boy in college often sings a different tune. So far as I have heard the college student speak on this point, he usually says: "The certificate system is well enough for the good student. But he could pass the examinations and get in anyway. For the man of shaky preparation or abilities, it's a poor thing, because he often comes to college at great expense, struggles for three months or more with courses he isn't fit for, and then is sent away." Whether this statement is entirely frank or sound I do not pretend to say. I wish merely to point out that, the certificate system not being yet a finality, we ought to gather all the evidence, and that a large body of evidence has not yet been used. X.

PROVIDENCE, March 13, 1903.

CHAIRS OF CHINESE.

TO THE EDITOR OF THE NATION:

SIR: I have just received the *Nation* for December 25, 1902, and beg to ask you whether, on page 501, column i., in speaking of chairs of Chinese in the United States, you refer to the chair in Columbia or to that in the University of California. The latter was endowed by Regent Tompkins some twenty years ago, but the land which he gave for the purpose was not sold till 1898, when it became salable for $50,000, the amount which Mr. Tompkins judged necessary. Since 1898 the chair has been filled in the person of Professor John Fryer, who for thirty years was in the service of the Chinese Government as translator and compiler, and who is probably one of the most accomplished Chinese scholars now living in America. His chair is known as "The Agassiz Professorship of Oriental Languages," but his work is chiefly in Chinese, with some attention to Japanese.

I am, very sincerely yours,

EDWARD B. CLAPP,

Professor of Greek in the University of California.

BERLIN, March 12, 1903.

FROM SUIDAS TO BLAKE.

TO THE EDITOR OF THE NATION:

SIR: Referring to the volume of 150 "Sonnets" published in Boston by the Rev. James Vilas Blake of Chicago and briefly reviewed in your issue of March 12, under "Recent American Poetry," I venture to express the hope that the sonnet quoted in your article is not a fair specimen either of the poetic qualities or of the originality of the remaining 149. You will find the little story, with the identical details as told in the sonnet, in the second book of Lessing's Fables, being number 28; but Lessing was—well, let us say—old-fashioned enough to give credit to Suidas, from whom he took the story.—Very respectfully,

A. B.

CHICAGO, March 16, 1903.

INDEXES THAT DO NOT INDEX.

TO THE EDITOR OF THE NATION:

SIR: A good example of this sort, in a book much more widely used than the one lately discussed, is the "revised and enlarged" edition of Palgrave's 'Golden Treasury,' Macmillan, 1898. The "Index of Writers," pp. 371-3, has not in any item any relation to the text. F. M.

Notes.

Hitherto unannounced by Houghton, Mifflin & Co. are 'The Correspondence between Ralph Waldo Emerson and Herman Grimm,' edited by Frederick W. Holls; 'Ruskin's Comments on Dante,' with an introduction by Charles Eliot Norton; 'Trent's Trust,' by Bret Harte; 'The Confiscation of John

Chandler's Estate,' by Andrew M. Davis; 'Of Education,' by R. R. Bowker; and 'Alice Freeman Palmer,' a report of a memorial service.

Prof. James A. Harrison returns to his latest study in a 'Life and Letters of Edgar Allan Poe,' in two volumes, to be published by T. Y. Crowell & Co.

In April, Harper & Bros. will publish in connection with Chapman & Hall a *de luxe* edition of the Poems of Charles Dickens, compiled and annotated by Frederic George Kitton.

Another popular edition of the works of Charles Dickens is announced by Chapman & Hall and Henry Frowde, the joint publishers of the "Oxford India Paper Dickens." They are coöperating in the production of a new, complete, and fully illustrated edition, to be known as "The Fireside Dickens." There will be twenty-two volumes in all, printed in large type on good opaque paper with decent margins, and published at a low price. The first three volumes are on the point of being issued.

'A Prairie Winter' is announced by the *Outlook* Co.

Richard G. Badger, Boston, will bring out the verse of the late Mary M. Adams, wife of the late President Charles Kendall Adams, under the title, 'The Song at Midnight.'

'How Paris Amuses Itself,' by F. Berkeley Smith, and 'Washington, its Sights and Insights,' by Mrs. Harriet E. Monroe, are in the press of Funk & Wagnalls Co.

A new Life of Andrew Jackson, by Arthur St. Clair Colyar, Nashville, was announced by the author in the third number of the *Gulf States Historical Magazine*, in terms not quite convincing of the capacity of this defender of Jackson against "two books that are largely defamation," viz., Parton's and Sumner's. The extract from his introduction is accompanied by a copy of an original oil portrait of Jackson by Earle—more like Harvard's LL.D. than like Old Hickory.

The Dictionary of National Biography, besides its supplementary three volumes already published, and a fourth contemplated, consisting wholly of corrections, is to be provided with 'An Index and Epitome' in one volume of 1,464 pages, as a brief guide to the contents of the great work. There has been a general scaling down of one-fourteenth, under Mr. Lee's editorship. Each summary will have an indication of the place of the original article. The publishers are Smith, Elder & Co. (New York: Macmillan).

The firm of Cotta, in Stuttgart, in order to celebrate the hundredth anniversary of its becoming Goethe's publishers (1806-1906), is taking time by the forelock, and has already brought out the first and twelfth volumes of its jubilee edition of Goethe's works. These are respectively the Poems and "Iphegenie," "Tasso," and "Die Natürliche Tochter." Publication will proceed at a rate to arrive abreast of the century ending 1906.

Baedeker's 'Southern Italy' in the fourteenth edition is imported by the Scribners. This indispensable assistant to the traveller whose pocket and German are both too small for "Gzell-Fell," has been thoroughly revised and brought up to date. Former loiterers about the cliffs and mountains southwards from Naples may easily verify the truth of the general principle asserted in the preface—that "charges . . . have a constant tendency to rise."

A vade-mecum of a more formidable sort is Mr. Ernest A. Baker's 'A Descriptive Guide to the Best Fiction, British and American.' This stout volume comprises some 4,500 titles, the chief translations of foreign novels, a list of historical romances arranged chronologically, and a subject-index. Since the authors are introduced alphabetically by periods, it is very easy to consult the lists. This differs from the ordinary bibliography in giving a brief hint of the plot of each book and occasionally a characterization. Obviously, Mr. Baker cannot have read all of the 4,500 "best" novels, and such a statement as that "Sidney's 'Arcadia' is . . . Gothic in manner" has not only a second-hand but an eighteenth-century tang. For all the early period of English literature the book is inadequate, but the full notes on editions and prices in the later period will save many a weary hunt through the publishers' catalogues. Mr. Baker makes frank confession that his book contains more than the usual number of errata, a few of which he enumerates. A complete list of corrections would have been more grateful amends.

'Hazell's Annual' for 1903 (New York: Scribners) has been purposely delayed in order to make a finish of 1902, and this is perhaps to be the rule hereafter. Among the year's topics are the consummation of transatlantic wireless telegraphy; the Rhodes bequests; the coronation of King Edward; consumption sanatoria, etc. Handy for reference is the survey of the world's newspapers, with leading examples. There is the usual number of new maps, with the obituary of the year, and all the statistical and biographic matter which makes this work a most valuable "cyclopædic record of men and topics of the day."

In the elegant reprints to which the Burrowes Brothers Co., Cleveland, has devoted itself, timely is Lionel Wafer's 'A New Voyage and Description of the Isthmus of America' (1681), published in 1699. The very competent editor, Mr. George Parker Winship, librarian of the John Carter Brown Library, has supplemented the text of the narrative (which was translated into many languages and reproduced in volume three of the 'Voyages' of his fellow-adventurer, Dampier) with notes drawn from the buccaneer literature of the time; besides furnishing a summary introduction. The original illustrations are given in facsimile, together with the British Admiralty map of the Darien country. The account of the aborigines lends especial interest to this relation.

There is some very happy designing in color and in black and white, by E. Mars and M. H. Squire, in Rand, McNally & Co.'s edition of Stevenson's 'Child's Garden of Verses.' The only blot on the decoration is the invariably unsuccessful attempt to improve on plain print in the cases where the verse is enclosed within an ornamental border. Some of the head and tail-pieces are noticeably dainty.

The last addition to the "Stories of the Nations," 'Mediæval India under Mohammedan Rule,' by Stanley Lane-Poole (Putnams), is a continuous and solemn warning against any dream of conquest of that, or indeed of any, Oriental people. The Muslim invasions are rehearsed, beginning with that first abortive attempt in 712 which led to nothing but a partial occupation of the valley of the Indus. Then there is a long silence until the end of the tenth century, when Mahmud of Ghazna, Mahmud the Idol-breaker, began his sixteen raids which swept the plains from the Indus to the Ganges. With him Islam arrives in India, and is the dominant force there through the Turkish kingdom of Delhi and the Moghul empire till the latter crumbled and fell in the eighteenth century, and the East India Company took its place. But, first and last, India absorbed and overcame its conquerors. They vanished or became Indian. India is still a unity, though Islam ruled it for over six centuries and a sixth of its population is now Muslim. Conquests and empires have effected nothing; the permanent is the leaven working silently in the lump. So now, when Islam no longer comes with power, fifty-thousand Hindus annually embrace it. The moral is easy to draw. The graphic accuracy of Professor Lane-Poole's delineation is above praise. Mahmud the founder, Babar of the Memoirs, Akbar in his search for a reasonable faith; Jahangir, the candid, with his oddities as we know them through Hawkins and Sir Thomas Roe; Aurangzib the Puritan; the Portuguese, the Dutch and the English in India, are all living here. In details we have noticed only one slip. On page 30, al-Farabi, the philosopher, is made part of the circle of Mahmud at Ghazna. But he died in 950, and Mahmud in 1030. Further, he would never have risked his head with Mahmud. Like his patron Sayf ad-Dawla the Hamdanid, he was a devoted Fatimite, while Mahmud was of the straitest Sunnite sect, an anthropomorphic Karramite. At Mahmud's court, al-Beruni wrote an exposure of the claims of the Fatimids to descent from the Prophet.

The monumental "Storia Letteraria d'Italia, scritta da una Società di Professori," which was undertaken by the publisher Vallardi of Milan six or seven years ago, arrives at virtual completion by the publication of Professor Francesco Flamini's 'Il Cinquecento,' a large and closely printed octavo in which Italian scholarship is seen at its best. The various literary forms of the sixteenth century, both prose and verse, receive exhaustive treatment in separate chapters, but no strain of Renaissance culture which affected literature is neglected, and the chapters on art, politics, and social ideals are among the most illuminating in the volume. Professor Flamini's erudition is remarkable, but the pages devoted to Ariosto, Castiglione, Michelangelo, Machiavelli, Tasso, indicate that critical insight and historical perspective have not suffered in the accumulation of the vast materials of research. The generation of Carducci, D'Ancona, and Pio Rajna is passing away, but the traditions of Italian scholarship in the North are safe in the hands of Professor Flamini, just as, in the South, the mantle of Francesco de Sanctis has fallen upon Benedetto Croce. An excellent bibliographical appendix completes the work.

The annual volume of the American Philological Association shows an encouraging gain in membership and a treasury balance of over $700, notwithstanding a contribution of £40 to the Platonic Lexicon in course of preparation under the editorship of Professor Campbell. This, by the way,

is to be an annual contribution for three years. The proceedings of the Pacific branch, established four years ago, show quite a different trend from that of the parent society. While the latter devotes itself almost exclusively to subjects drawn from the language and literature of Greece and Rome, the subjects considered by the Pacific branch are almost wholly mediæval or modern. On the surface it would appear that the classical interests of the Pacific Coast are not strong enough to maintain an organization of their own, or even to save themselves from being swamped by the students of mediæval and modern philology with whom they have associated themselves. The bibliographical record for the past year shows quite a heavy increase in publications by members of the Association as compared with the year before. The membership list betrays some unfortunate instances of carelessness in proof-reading.

It is of good omen that the Massachusetts State Federation of Women's Clubs has put forth a 'Syllabus for the Study of the History of Civil Service Reform,' compiled by Prof. Lucy Maynard Salmon of Vassar, with the acknowledged aid of three alumnæ. The survey is divided into eleven sections, from "Civil Service in the Colonies" to "Civil Service in State and Municipal Philanthropic Institutions," and even a twelfth, "What Remains to be Done." References to sources and authorities are given under each heading, and the titles are repeated in full at the end. We should like to see this syllabus distributed on every college athletic field. Meantime it may be had gratis of Miss Perkins, Concord, Mass.

One hundred and thirty-two words incorporated into American English, and to some extent as firmly in the speech of the mother country—in one case, *totem*, in universal scientific nomenclature—are marshalled and commented on in the October-December number of the *Journal of American Folk-lore* by Prof. Alexander F. Chamberlain of Clark University. He remarks of the word *cantico* that it was used by the Dutch and early English colonists from Massachusetts to Virginia. It is possible, then, that we may recognize it in the name of Pocantico River and Hills in Westchester County, N. Y., with its mingling of aboriginal, Dutch, and English inhabitants.

The twenty-eighth annual report of the Minister of State for Education in Japan (1900-1901) has just been received, and its text is in excellent English. Besides being rich in valuable information well digested and arranged, it has along with its chapters and tabulations three folding sheets which reveal at a glance the relative condition of popular education in the Empire. Six of the forty-eight districts show that between 90 and 95 per cent. of the school population is under instruction, and it is interesting to note that these are old centres of learning. Ten others show a percentage of between 85 and 90, and these also have been characterized by intellectual activity. Other districts, for the most part bordering on the sea, which have been noted for commerce and manufactures rather than literary products, have from 80 to 85 per cent. The lower percentages in other districts are explained by the sparseness of the population, or the existence of large spaces of untilled land, as, for example, the extreme northern provinces and Yezo. The map shows no percentages lower than 50, though Formosa is not yet included in the educational scheme, now over thirty years old. The growth, from 1896 to 1901, of from fifteen to eighty thousand pupils in the higher female, the technical and the middle schools, is shown in other diagrams. In the industrial schools—for agriculture, commerce, seamanship, etc.—the pupils taking a commercial training make one-half, and those in the agricultural schools one-fourth, of the total in attendance. Figures and diagrams show very clearly how rapidly Japan is becoming a trading nation, with ambitions for commerce rather than for war, and demonstrate also the fact that her people must increasingly colonize and find food supplies abroad. The financial diagram showing the income and expenditure of public schools for ten years —from two to thirty-six million yen— proves that the Japanese believe heartily in "the cheap defence of nations." Among the wonderful variety of subjects are chapters treating of libraries, and of the Tokio Academy, "composed of members selected from among old and venerable men of learning," to which foreigners of equal dignity "who have meritoriously labored in the interests of this empire may be admitted as associate members."

Gustav Storm, who died on February 23, was born in Norway, June 18, 1845. For a number of years he was professor at the University of Christiania. His publications, which include a large number of articles published in German and Scandinavian journals, deal with early Norwegian and Icelandic culture, with special reference to history and travels. In 1887, Storm published a pamphlet on the voyages to Vineland, which two years later appeared in English. Between 1886 and 1889 was issued his translation into Dano-Norwegian of the Heimskringla, or the Kings' Sagas, as he preferred to call it, and in 1900 the Norwegian Parliament appropriated twenty thousand kroner as a subsidy for a popular edition of the work. At the time of his death Storm was engaged on an edition of King Sverre's Saga.

—The fourth volume of the 'History of Woman Suffrage' (Rochester, N. Y.: Susan B. Anthony) carries the chronicle down to the end of the last century (1883-1900). In bulk it equals its several predecessors, and, like them, it can be read for instruction only, not for pleasure. Like them, again, it is indispensable for reference, and not merely does it summarize the proceedings of the several National Suffrage Conventions, but it exhibits under each State the present statutory condition of woman, whether for the franchise or for property rights and protection against the seducer. As before, many portraits of leading suffragists are given, including the two editors, Miss Anthony and her associate of the laboring oar, Mrs. Ida Husted Harper. The periscope embraces the progress of the cause in Great Britain, also, and her colonies, and there are appendices of testimonials in praise of the working of female suffrage in the States of the Union where it has obtained, and lists of prominent advocates of it, legislators and officeholders, very significant of the change of tone within the memory of men in middle life. Miss Anthony's devotion of means and strength to this publication from first to last has seldom been surpassed in the annals of philanthropy, as one may read in the preface. Perhaps the most interesting section is that which relates to the growth of the suffrage or anti-disabilities movement at the South, which of course was impossible before slavery was abolished, and is now impeded by the same causes (including the color line) that made and make public opinion so hard to create and concentrate in that quarter. Almost nothing could have been done, apart from the Border States, without an alliance with the Woman's Christian Temperance Union. Except in Missouri, every organization has been effected since the date with which this volume opens, yet the editors can say of Kentucky that it was "the first State in the Union to grant any form of suffrage to women by special statute," viz., in its School Law of 1838 enabling widows to vote for trustees. In 1898, the Constitution of Louisiana granted suffrage, even by proxy, to all taxpaying women on all questions of taxation.

—A history of Egypt which extends to eight volumes and contains about 1,800 pages, with 135 additional pages of double-column index, might be supposed to be a very formidable aggregate. Such is the series put forth by Dr. Wallis Budge, keeper of Egyptian and Assyrian antiquities in the British Museum, and published by the Oxford University Press (New York: Henry Frowde). The whole range is indicated by the general title, "A History of Egypt from the End of the Neolithic Period to the Death of Cleopatra VII., B. C. 30." The first volume, dealing with the neolithic and archaic periods, was recently noticed in these columns. The facts presented in that volume indicated the results of excavations made within a decade and a half, and the book is a report of progress to date. It is a brief résumé, by a competent hand, of what the excavators themselves have written. It is not the final book, but it is to be welcomed for what it is. The following volumes present the historical sequence of known facts in regard to the dynasties, the rulers, and, to some small extent, to the people. There is little scope for originality, but plenty of room for picturesque presentation of the story in popular language with a view to general instruction and entertainment. Dr. Budge has made good use of this opportunity. The employment of hieroglyphic characters for the spelling of proper and official names in the midst of the text has a very learned look, but no reader need be terrified by the appearance, for this practice does not interfere with the reading of the book or the comprehension of the story in the least. And the story is one of no mean interest, particularly as two valuable expedients in illustration have been resorted to. The pages are adorned with very many woodcuts and half-tones, which give the successive steps in the growth and variation of Egyptian art, particularly that of the sculptor. Translations of a great many texts are also introduced, throwing a contemporary light upon the situation. Some of these texts, like the "Israel stela," were discovered comparatively recently; the Tell el-Amarna tablets come in for discussion for the remarkable light they throw upon the internal and external policy of the Pharaohs in the New Kingdom. The attempt is made to utilize all the discoveries

that have been made, and thus to bring the story down to date. Good judgment is shown in regard to original documents, and Dr. Budge has not burdened his pages with abstruse and weighty discussions which have no interest for the ordinary reader, and serve only to distract attention without giving valuable instruction. While these volumes constitute the most complete history of Egypt that we now have in English, the scholarly inclined will hope that Petrie will soon complete his volumes covering the later dynasties, and that he will revise his first volume, already out of date. Though Egypt's history is the oldest known, its earliest periods now need to be written almost bulletin-wise.

—J. B. Firth's 'Augustus Cæsar and the Organization of the Empire of Rome' is the latest addition to Putnam's non-juvenile series of "Heroes of the Nations." The prescribed limits of the series, of course, forbade full and minute details of a life so long and busy, but nothing really essential seems to have been omitted. Perhaps the most questionable feature in the treatment is the assignment of about one-half the volume to the period previous to the battle of Actium, since a great deal of this earlier matter has been covered, and well covered, by the lives of Cæsar and Cicero, in the same series. Mr. Firth seems more or less open to the charge of vacillation in his general estimate of Augustus, but one must admit the difficulty of arriving at any consistent evaluation of so Sphinx-like a character. He accepts the present-day theory that it was a dyarchy rather than a monarchy which Augustus established, but is ready to admit a pretty rapid throttling of the power which the Senate is supposed at first to have retained. We can hardly agree that Augustus was by temperament not a radical at all, but really a disciple of Cato. His real spirit is to be sought, not in his policy of retaining old forms and names, but in the radical alterations concealed under cover of the old terminology. The reader is constantly reminded of the bitter words of Tacitus concerning the successor of Augustus: "Proprium id Tiberio fuit, scelera nuper reperta priscis verbis obtegere." We may agree with Mr. Firth that the net result of this crafty revolution under the disguise of the old terminology was a distinctly more orderly government, so far as ordinary matters of administration were concerned, than the mismanaged republic of the preceding epoch had been able to secure; but when it comes to striking the balance between tyranny and order on the one hand and liberty and disorder on the other, opinions will differ. Nor is one compelled by any unavoidable logical process to accept the assertion that the Roman Empire as it actually developed under Augustus and his successors, was the only humanly possible outcome of the previous disorder. Many a Latinist will object vigorously to the dictum that there is hardly a trace of real moral earnestness in Horace. The famous group of odes at the beginning of Book III. is a sufficient answer to that. But, aside from points of that kind, Mr. Firth has produced a volume of very solid worth, and, as it is the only biography of Augustus in the English language, its position will no doubt be secure.

—Last October we noticed the work called 'L'Habitation Byzantine,' a handsome volume by General L. de Beylié, published at Grenoble and Paris. We have now from the same publishers (Librairie Dauphinoise) a supplement containing eleven plates, with each two, and in one case four, separate photographic views, and twenty pages of text in which are interspersed a dozen illustrations in line. The motive of this new publication has been the discovery of some, and the further examination of other, Byzantine houses in Constantinople proper and two of its suburbs—that is to say, in Stamboul, Phanar, and Galata. The author, with that frankness which distinguishes all his work, expresses doubt, conjecture, uncertainty, on every page. He thinks that four or five of these old houses are of a date before the Moslem conquest, in 1453, but that the others are probably later, and it is for the reader to decide from the photographs how much of the old spirit remains in them. There is one peculiarity which, as it seems, is shared by many, perhaps most, of the eighty houses which are characterized as Byzantine, and are exemplified by the twenty described and illustrated, and that is the use in the upper stories of overhanging walls of solid masonry supported on cut-stone corbels. In several cases there are two such corbel-courses, and two stories carried in projection, one beyond the other. In some cases the overhang is very considerable; there is one which must be of five feet, but in this case the wall is not heavy. A peculiarity still more marked and unexpected is this—the overhangs are arranged *en crémaillère;* that is to say, the upper story presents an outer wall whose plan is like the teeth of a saw, one sloping side long, and the other very short—not one-fifth of the former: this upper story projecting above a smooth-walled, right-angled ground story. What purposes, as of defence, are hinted at by this curious disposition it is hard now to conceive. The little book would be of absorbing interest but for the unsatisfactory character of the collotypes. These are of that vexatious sort which present absolutely opaque shadows, profound blackness, in which all details are lost.

—Prof. Eugène Hubert, of the University of Liège, has utilized his exhaustive researches in the archives of Belgium and Holland in a memoir on the Barrier Treaties, which, as extracted from the publications of the Royal Belgian Academy, forms a quarto volume of 400 pages (Brussels: J. Lebègue & Cie). The subject, now well-nigh forgotten, is well worth the labor which the industrious professor has devoted to it. As early as 1673, the United Provinces of Holland formulated the project of converting the Austrian Flemish possessions into a buffer state to protect them from the ambition of France, and to this they tenaciously adhered during the vicissitudes of the endless wars of Louis XIV. With the support of England, almost equally interested in curbing French aggression, this became a recognized feature of European policy at the Peace of Utrecht in 1715, when the Barrier Treaty surrendered Flanders to the United Provinces, to be restored to Austria subject to stipulations under which the Dutch were to garrison Namur, Tournai, Menin, Furnes, Warneton, Ypres, and Knokke, while Termonde was to receive a garrison composed of the forces of the two Powers. This army of occupation was to consist, in times of peace, of 35,000 men, and its cost was to be defrayed by the unfortunate territory occupied.

—Under any circumstances, harmony was not to be expected between the native population and the armed strangers thus imposed upon them, but the inevitable sources of trouble were greatly multiplied by the question of religion. The Dutch were resolute Protestants; in Flanders Catholicism was the religion of the state. By the provisions of the treaty the strangers were entitled to the free exercise of their faith and to places in which to worship. Religious differences were still in a stage too acute to render practical toleration such as this easy to carry into effect. The Flemings protested violently, and the project of a Sicilian Vespers, in which the occupying troops should be cut off in a single night, was openly advocated. There was ample cause for trouble besides the local squabbles which were continually arising. Such Protestants as there were in Flanders naturally sought to share the privileges of the garrisons, and converts from Catholicism were protected. Faults were plenty on both sides, and clamorous complaints were incessant which not infrequently threatened sanguinary breaches of the peace. Former writers have diligently examined the political and diplomatic history of the Barrier Treaties, but M. Hubert is the first to investigate thoroughly what may be called the domestic aspects of the question and its influence on the population, by utilizing the fugitive literature of the period as well as the national archives and those of the municipalities. From these abundant sources he has been able to present a curious and instructive picture of the internal life of Flanders under these exceptional influences.

NOVA SOLYMA.

Nova Solyma, the Ideal City; or, Jerusalem Regained: An anonymous romance written in the time of Charles I., now first drawn from obscurity and attributed to the illustrious John Milton, with introduction, translation, literary essays, and a bibliography, by the Rev. Walter Begley. 2 vols., 8vo. Charles Scribner's Sons. 1902.

For a generation which every year witnesses literally hundreds of additions to the already immense volume of fiction, it is difficult to realize a time like the first half of the seventeenth century when three romances, as the editor of the above volumes would have us believe, was the production of a nation during a period of fifty years. Perhaps, if the shade of one of these romancers of the earlier ages of fiction were confronted with the ridicule of his nimbler and more prolific modern brethren, he might reply in somewhat the same words of scorn as Edmund Burke to the lawyers who criticised his tardiness in the preparation of the case against Warren Hastings, namely, that a rabbit which was accustomed to breed some six times a year could naturally know nothing of the time required for the gestation of an elephant. The modern devotee to the kind of fiction which we usually as-

sociate with the circulating libraries would certainly not be disposed to dispute one term of this comparison, but the serious student of literature, we hope, would interpret the answer in a less malicious sense.

'Nova Solyma,' indeed, is very far from corresponding to our present conceptions of a romance. It belongs in essentials rather to the class of works of which More's 'Utopia' is the most famous example, in which the author chooses the form of fiction to set forth his views on questions of education, government, or even religion. In the present work, however, the element of romance is not totally excluded in the press of didactic matter. Nevertheless, the didactic aim dominates here also throughout, as will be evident from the following brief outline of the contents of the book.

Two youthful Englishmen, Politian and Eugenius, who have had an opportunity of befriending a young man of Jewish race, named Joseph, recently the victim of a robbery, accompany him home to his father's house in the city of Nova Solyma—which, if it has any local existence, we may suppose to be situated on the site of the ancient Jerusalem. They arrive just as the inhabitants of the city are celebrating a great spring festival, in which the most conspicuous figure is a sister of Joseph, who appears in the pageant as the Daughter of Zion sitting in the shade of the symbolical Vine. The young strangers, who are smitten with love of her at first sight, are now brought to the house of Joseph's father, Jacob—a sort of House Beautiful, the abode of goodness and wisdom. The visitors have not been here long before the process of their instruction begins. The appearance of the two little brothers of Joseph, quaintly named Auximus and Augentius, affords an opportunity for a discourse from Jacob on the training of children according to an ideal system which is in force in Nova Solyma. This discourse is supplemented by an alleged dream, of allegorical import, which the matron who is charged with the care of the boys recounts as a warning against the temptations of pleasure. "What a happy thought," exclaims Politian, naïvely, "to turn mere idle tales to such profit!"

There next follows in the romance an episode with no directly didactic purpose. Alcimus, the son of Joseph's tutor, turns up repentant, and gives an exciting account of his adventures as a member of the band of robbers to which Joseph had fallen a victim. The author soon returns from this episode, however, to more edifying matter, and we have discourses now from Joseph on such subjects as the relation of art to nature, the origin and constitution of the universe—discourses which it would be impossible to make one's way through but for a certain genuine religious fervor which animates them. Omitting some intervening material, of which a story of witchcraft is perhaps the most curious, we come to the part of the book by which the author probably set the greatest store—namely, the description of the colleges of Nova Solyma. We have here the sketch of an idealized English university with a system of affiliated schools, such as it has been left for some of the universities of our own time and country to approach most closely in practice. In this division of his work the author develops very fully his ideas of education, the main object of which should be, as he declares, the training of good citizens rather than scholars. In setting forth his conception of the proper material of study, the author is led on to a discourse on poetry, and then, by way of illustration, he presents as a composition of his hero, Joseph, a poem in the epic style on the expedition of the Spanish Armada. In connection with the description of the ideal university we have specimens of both classroom and public lectures —the first of which, on the Christian Cosmology, is of a character to empty in a few minutes any modern lecture room, at least. These avowed *ex-cathedra* discourses do not differ materially, however, from others which in the course of conversation are delivered by Joseph, his father, and his tutor. All have a certain interest as reflecting the strong devotional feeling of a generation which, in the moral strength derived from religious faith, is not likely to be soon equalled again. There is particularly a crescendo of religious enthusiasm towards the conclusion of the book which is not without impressiveness.

These discourses constitute much the larger portion of the second volume, yet, as in the first, we have here also threads of adventure interwoven with the more serious matter—a pirate story, for instance, which seems to have been taken from a contemporary pamphlet; then the episode, involving even humorous situations, of a girl who, in adopting masculine disguise to follow her lover, becomes herself the object of mistaken passion on the part of one of her own sex. The editor identifies the source of this last story with that of "The Two Gentlemen of Verona"—namely, the second book of Montemayor's 'Diana.' In the midst of all these lectures and romantic episodes the two young Englishmen, Politian and Eugenius, have been almost brought to blows by the jealousy which has sprung up between them over Anna, the sister of their friend, and the chief figure in the festival with which the book opens. The author, however, introduces now a twin-sister identical in appearance with Anna—a device which has the double advantage of solving the difficulty that has arisen with reference to the two lovers, and of showing at the same time that love rests on a mere delusion. The romance closes with the marriage of these two couples, and a bridal song of Heavenly Love suggested by the Song of Solomon.

In view of the dearth of fiction from the period in which it was composed, Mr. Begley has unquestionably performed a service to scholarship in unearthing 'Nova Solyma.' It is of at least equal interest with the very similar 'Argenis' by Barclay, which, perhaps owing to Coleridge's exaggerated commendation, still receives considerable attention in histories of English fiction. The contrast, however, between the different fates of the two books is not a little remarkable. Whilst 'Argenis' was translated into all the chief languages of Europe, 'Nova Solyma' seems to have fallen still-born from the press. The book, which, as the author tells us, was written many years before, in his youth, appeared, to be sure, at a time which was anything but favorable to purely literary successes—namely, in the year of tension and excitement which preceded the execution of Charles I. It is possible, moreover, that, in the interval which had followed the publication of 'Argenis' (1621), the diffusion of the novels of D'Urfé and La Calprenède in England had given readers a taste for a new kind of fiction. As far as the attitude of the reading public of our own day is concerned, it is safe to say that nothing in so obsolete a style would have attracted the slightest attention outside of the limited circle of specialists in the history of fiction, had not the editor made bold to connect the work with the most illustrious name of the period to which it belongs. We do not believe, however, that the judgment of criticism will sustain this ascription.

In the first place, there is not a particle of external evidence to support the theory of Miltonic authorship; and, in view of the bulk of the book and the place it must have occupied for a considerable time in the thought and life of its author, this would surely be singular, were the romance really the work of Milton. On the other hand, the arguments from internal evidence which the editor adduces are of much too general a nature to carry conviction. Indeed, on first reading the preface in which he has marshalled most of these arguments, one can hardly suppress the feeling at times that he really is not serious. The impression, to be sure, is due in a measure to his rambling and would-be-facetious style; and only after sifting down the matter of these preliminary pages, and the notes which with a liberal hand he has scattered in season and out of season up and down these volumes, does the reader observe that the parallelisms which he cites here and there have a certain cumulative value, so that one can perhaps reconstruct for one's self some show of argument in favor of the view which he has advanced. But, after all, what is one to make of arguments for identity of such vague import as that the author of the romance, like Milton, was appreciative of music, was a praiser of abstinence, was interested in theories of education, and so on? Dealing with such propositions in a question of individual authorship is like beating the wind. The most that these things show is what probably readers of the book will very generally admit—namely, that the author was a Puritan of the most highly educated class. There are no special, telling circumstances, however, as far as we have observed, which identify him satisfactorily with the most distinguished member of that class. The similarity between the plan of education in the present work and that in Milton's famous tractate is too general to have weight. Furthermore, we would say that the Arianism of 'Nova Solyma' is not apparent to us; but in any event, we have no reason to believe that Milton had already developed views of that tenor in his youth—the period of his life to which this work would have to be assigned. After all, however, the diffuseness of the work and the absence from it of any passages of the highest imaginative quality, such as we cannot believe that any work of the imagination of this length from the pen of John Milton would have been altogether devoid of, tell most heavily against the supposition of Miltonic authorship. None of the abundant verse in the volumes seems

to us to rise to the level of the best of the Latin elegies of Milton's youth.

But, apart from the question of quality, there is nothing in the known work of Milton that suggests the tremendous facility with which, to say nothing of the prose portions, the author of this work pours out epigrams, odes, an epic of no inconsiderable length, etc. One recalls, moreover, that, apart from translations, practically nine-tenths of the recognized verse of Milton's early life—especially is this the case with his Latin poems—relates to something personal, some incident in his life, his relations with his friends and similar subjects; whereas we have here a body of verse rivalling in bulk all that has been hitherto acknowledged as his for the period preceding his moving to Horton, yet dealing entirely with abstract themes and in no way giving expression to the author's personal feeling or experiences. Space forbids our taking up features of style in these poems which differentiate them from Milton's—such, for example, as the very sparing use of mythological allusions—a matter which has far more weight than Mr. Begley will allow. The most that can be conceded with regard to this claim of Miltonic authorship for 'Nova Solyma' is that the question deserves to be treated with a more exact critical method than has been employed by the editor. Such a treatment, of course, would have to be based on the Latin original of which Mr. Begley has here merely given us extracts in an appendix to his translation. To the question of sources which also calls for investigation, the editor has already made contributions of value.

In conclusion, it only remains to be said that the translation is well done. The stiffness which it is so difficult to avoid in turning Latin prose into English is seldom noticeable in these volumes to any disagreeable extent, and the metrical renderings are good. One may question the taste of employing terms like "rough-riders" and "syndicates" (in the modern commercial sense) in a translation of a seventeenth-century work; but in general the translator has preserved in his version the impression of mingled grace and austerity which we commonly associate with Puritanism in its higher manifestations—a union of qualities which stamps the work before us, whatever may be its faults, as the product of a noble age.

PEEL'S 'ENEMIES OF ENGLAND.'

The Enemies of England. By the Hon. George Peel. London: Edward Arnold. 1902.

Mr. Peel would have found it difficult to select a wider or more timely subject. "The meek shall inherit the earth" is not a text which fully accounts for the place occupied by Great Britain in modern politics; and where success has accompanied the lack of meekness, we need not wonder that hostile adjectives should rise to the superlative. Nearly ten years before the outbreak of the Boer war, Sir Charles Dilke candidly stated in Parliament that England had more enemies than any other country but China. The lapse of time has not reduced their number or qualified the heat of their resentment. Here, then, is a phenomenon which the enlightened Briton is bound to notice and, in his own mind at least, to analyze. When we consider the gravity of the question and the daily output of newspaper retort, it seems strange that no historical philosopher should have written a book about England and her enemies before.

In the first place, Mr. Peel's tone is exemplary. He might have been amusingly rude in any one of a hundred ways, for no vein of humor is easier to work than that which springs from the shortcomings of our national antagonists. English amenities in the days of the Dreyfus case must have incensed many a Frenchman to whom the name of General Mercier was hateful, and Mr. Peel, in turn, if he keeps a scrapbook, must have many a pleasant score to pay off. Were we to cast aside all canons of politeness and good feeling, any one of us might have a daily orgy of enjoyment in composing squibs against foreigners. However, these things do not help to bring back the age of Saturn, and when a writer in Mr. Peel's place shows a capacity for civil speech, the lovers of peace should applaud. The whole book is an argument, but one in which the writer does not rely for his effect upon smartness of repartee.

History has its secrets, kept under lock among the archives of religious orders and foreign offices. It also has its open secrets which are free to all the world—or would be, if the rarest talent were not required for interpretation. Why, for example, should England be disliked, or rather hated, by millions of people throughout the civilized world? Obviously, no document hidden away in Paris, St. Petersburg, or Berlin can give the clue, nor is it easy to believe that one simple theory of political progress will disclose the true cause of such antagonism. Mr. Peel presents us with a neat formula at a juncture where, according to our *à priori* notions, any formula must be an object of suspicion and most of all a neat one. Let us examine the nature of his proposition.

The decks are first cleared for action by a dismissal of the reasons which the Englishman usually assigns in private conversation as the grounds of this hostility. It is not a question of race, for racial sentiment has not sufficed to check the rancor of the Germans. It is not a question of religion, for the English and French hated each other in the fourteenth century, when both belonged to the same church. Neither are British tourists responsible for the mischief, as most people suppose, for Italy is their chief resort, and England is no more unpopular there than elsewhere. The man of business points to commercial rivalry, and Mr. Peel admits that the war of trade has played its part, though the main issues between England and the Papacy in their long strife have not related to money matters. Feelings of jealousy are allowed some weight, but it is pointed out that Philip II. was not jealous of Elizabeth, "who ruled over half an island only, and was seated on a shaking throne." Finally, we are told that some mysterious natural law forces nations into antagonism beyond their will. To refute this view, Mr. Peel cites passages from Pitt and Disraeli.

Such a survey and rebuttal of leading theories brings us to a single contention, of which the whole book is a defence:

"If, therefore, neither race, nor religion, nor manners, nor trade, nor envy, nor nature, satisfactorily accounts for this antagonism, the true cause is as follows. . . . Throughout the period from the eleventh century until now, several great powers have arisen in a consecutive series towards the domination of Europe, in imitation, conscious or unconscious, of Rome. But the success of any in that project would be death to ourselves. Accordingly, as the liberties of Europe coincide with our own, each power in turn, at a certain stage in its progress towards ascendency, has encountered the strenuous opposition of England. . . . Though we have thwarted or helped to thwart each aspirant, we have destroyed none; and thus, in course of time, animosities, bred from the broken ambitions of each, have slowly accumulated against us."

Dr. Fitchett has written a work on the wars of the revolutionary and Napoleonic era (four volumes bound in red), which he styles 'How England Saved Europe.' Mr. Peel's one volume is bound in blue, but there is no real reason why it also should not have been called 'How England Saved Europe, 1066-1902.'

Before making any comments of our own upon Mr. Peel's thesis, we shall briefly describe the way in which he develops it. He does not for a moment deny that these pushful European states which have sought to wear the mantle of Rome deserved the reward of greatness. Each in turn rendered some service to humanity and gained thereby a legitimate prominence. Unfortunately, however, the love of leadership degenerated into the lust of tyranny. Thus, with the Hapsburgs, *primus inter pares* was not a sufficient motto, but Frederick III. must put forth the challenge, *Austriæ est imperare orbi universo.* Had the Hapsburgs been content with guarding the eastern frontier of Christendom, all might have been well, but in their pride they conspired against the balance of power and brought upon themselves the enmity of England.

One by one the states of Europe have had their imperial or their colonial aspirations. Mr. Peel, after defining and illustrating his general principle, takes up the sequence of ambition in successive chapters. The long series of England's enemies is made to begin with the Papacy and end with Germany, by which we simply mean that Germany leads the pack at the present day. We give the list, and leave the reader to supply in most cases the obvious chronology. The Papacy (from first to last, beginning with the Norman Conquest); France (in the Hundred Years' War); Spain, Holland, the Bourbons, the French Revolution, including Napoleon; Russia, Germany. The book closes with a notice of the proposal which has been made by Treitschke and Prince Uchtomsky, namely, that Germany and Russia should combine against England. Is it likely, asks Mr. Peel, that the Dual and Triple Alliance will join hands that they may crush the island state? We shall not describe at large the obstacles which he places in the way of such a league, but the last of them is worth quoting from its particular reference to America: "Besides, the relatives of England across the sea might insist upon an inquest; if she died intestate, they might claim her inheritance, so that her decease would be the signal for a contest indefinitely prolonged."

In offering a few words of criticism, we may begin with the remark that Mr. Peel's essay seems academic rather than practical. It makes an entertaining book for the historian, and, just as it stands, it was well

worth writing; but in our judgment its chief virtues are of an incidental nature, and do not spring from the merits of the main argument. While we should be the last to depreciate the value of the historical method, we doubt whether the causes of modern hostility towards England antedate the outbreak of the Seven Years' War. A truly practical book on this subject should begin, we think, not earlier than the time of the elder Pitt, and devote itself to the analysis of modern tendencies. The merest glance at the state of Europe in the middle years of the eighteenth century will show that the general feeling towards England was very different from the animosity which prevails to-day. Even during the war of the Austrian Succession, English was a fashionable language in Paris, and the spread of English ideas is always allowed some weight among the causes of the French Revolution. We need not dwell upon the fondness of the French liberals for England at this period, although they formed the élite of the nation, but we may recall the politeness of the officers towards each other during the Seven Years' War. When we reach the days of Nelson and Napoleon, the spirit has manifestly changed, and both nations are deeply embittered. France may be taken as an example, as she was the leading state of the Continent in 1750, and the most consistent opponent of England. Prussia, the rising power of central Europe, was, of course, an ally of England during the Seven Years' War.

When Mr. Peel asks us to plunge with him into the "dark backward and abysm of time," he gives us indeed some interesting facts about the relations of England with the Continent, but much of his pleading is beside the point. The line of argument which he follows out to prove that England has incurred the general enmity by opposing each of the greater states in turn, might with equal force be applied to France. Since the eleventh century no other state in Europe has passed through so many international complications as France or been so frequently embroiled. Every great state has stood in the way of every other great state, and helped, by pulling down its threatening neighbor, to preserve the balance of power. If England, protected by the sea, has often taken a notable part in these quarrels, she has, on the other hand, been implicated less often and less seriously than France. Nor can it be well contended that any strong antagonism between the Continental states as a unit and England sprang up before the Seven Years' War.

Speaking positively rather than negatively, we should be inclined to term the general enmity of the Continent towards England a modern sentiment, and one which is mainly due to the spectacle of an unwonted success. This view sounds commonplace, and we therefore advance it with a certain amount of shame. Still, there is one broad fact to which appeal can be made. States are seldom hated while they remain insignificant, and it would be hard to prove that England was generally hated before she achieved territory by the Seven Years' War, prestige by her part in the struggle against Napoleon, and wealth by the industrial revolution. The ways in which Englishmen show their consciousness of success may have added somewhat to the intensity of prejudice, but the root of the existing condition is not to be sought in a rich legacy of mediæval grudge, or in mere jealousy, but in the clash of modern rivalry. Were Great Britain "taken down a peg," we should hear much less about her from the press of Germany, France, and Russia.

A Canadian botanist spending a winter at Bonn was gravely informed in university circles that the Canadian contingents were driven by compulsion to serve in South Africa, and went thither with great reluctance. No doubt the growth of imperialism is disquieting to the Continent, and adds fuel to the flame. A larger item in the count against England is the prosperity of the United States, which, whether at peace or at war with the mother country, is none the less a state of English origin, and still remains actuated by many of the promptings which the English share in all parts of the globe. Continental *Schadenfreude* has grounds enough and to spare when it contemplates the spread and encroachments of the Saxon race. The idea that the grudges of to-day have been slowly accumulating since the eleventh century and are the fruit of ambitions successively thwarted, is much too archaic. The opportunism of politicians and of nations would be a sufficient bar to hatred of such long inheritance. England is hated not because she has thwarted the powerful, but because she is powerful herself.

This is our chief stricture upon Mr. Peel's book, which otherwise is the work of a scholarly and agreeable writer.

Kotto: Being Japanese Curios, with Sundry Cobwebs. By Lafcadio Hearn. New York: The Macmillan Co.

While Mr. Genjiro Yeto furnishes drawings in the body of the text and many a full-page picture, the frontispiece of this latest of Mr. Hearn's works is a photograph. It represents a graveyard, with the stone railing that simulates carpentry, and the Sanskrit monograms that lend literary glamour and holy mystery to the ignorant. Here we see the shaft capped with the image of Buddha in Nirvana on the lotus, the inscribed boulder, the symbolic monuments, including that which, by its various shapes, representing earth, air, water, fire, and ether, typifies the five elements of which man's body is composed, and, last but not least, the ever-fresh blooming flowers placed by loving hands *in memoriam.* All these fitly set forth the general character of the author's reveries, and in composite represent the one dominant thought underlying his score of sketches. Exquisite in fancy and rich in literary graces which clothe his thoughts, these seem for the most part to be as the exhalations of the graveyard. The dominant tone of all is not that of hope or cheer, nor is the outlook towards the future. It is rather that of melancholy, even of gloom. The main argument, contended for again and again, repeated almost with weariness, in Mr. Hearn's books, is that of involuntary memory, the organic memory of the race, the transmitted power that comes out of the great storehouse of ages of things remembered. This he finds not only in man and beast; even matter remembers. The dreamer thus (p. 169) confesses: "I cannot rid myself of the notion that Matter in some blind infallible way remembers." Later on the same page, this artist in words, who never loses his dogmatism even when most steeped in the spirit of beauty, utters further his creed: "In every unit of living substance, there slumber infinite potentialities simply because to every ultimate atom belongs the infinite and indestructible experience of billions of billions of vanished universes."

Armed with such a creed, Mr. Hearn revels in the delights that come from studying, in the land of little things, the minutiæ of Japanese poetic conceits, folklore, dreams, and reveries. Yet, lest the spectre of the brain should become too foul and disturbing, he happily, according to Japanese fashion, provides us at the end, in both text and picture, with Baku, or the eater of dreams. This creature, not least in the mythical zoölogy of Japan, has a double deck of eyes in his head and a triple array of eyes on either flank. The invisible brute is guaranteed to devour all nightmares and other creatures of darkness and evil digestion.

One would almost argue from Mr. Hearn's literary career in Japan that his intellect is taking on Japanese limitations. If we judge by the literature of Dai Nippon as the result of a thousand years of thinking, the delight of the natives is in little things. Works of sustained ability and noble proportions are few, though colossal mass, formidable continuity, and vast abundance of the fragmentary and ejaculatory, in numbers, chronicle, drama, fiction, and scripture, are not wanting. So in this latest of Mr. Hearn's volumes, daintily clothed as it is, we have only bits and chips—"curios and cobwebs." Nine little tales from old books illustrate strange beliefs. Some are ghost stories, others show how largely the islanders have made superstition the teacher of etiquette, appealing to fear, not only to deter from impropriety, but to hold immune and intact their system of social taboo, which shrinks with horror at the too much. This is notably illustrated in the case of a samurai who, instead of properly drinking tea out of a tiny cup, gulped it out of a large water cup. Seeing a face mirrored in the tea, he defiantly and repeatedly drank, ghost and all, only to suffer grief later. In the case of the hunter, expert with bow and arrow, on the one hand, and the priest seeing Buddhist visions on the other, common sense prevails over pious fancy. It is amusing to see how even the poor insects are saddled with superstitions and prejudices. The house fly, pestering the forgetful or dishonest man, is the unquiet spirit of the dead girl whose savings he did not invest, according to her request, in masses for her deceased mother. The youth, susceptible to his dream of a genuine Japanese Marjorie Daw, finds that she exists only in the breath of a frog. Even the crabs bear the image of the Heiké warriors who, after the great naval battle of extermination, were drowned off Shimonoséki over eight centuries ago. Most of the bugs of various sorts are associated with unlucky human beings or their wraiths, so that one can trace the outlines of history in popular entomology. The chapter on fireflies is an exquisite study of poetry, literature, folk lore, and science. The Japanese have always sung the praises of this living electric light, and have many dainty conceits concerning it. In these later days of the spectrum and photometer, Japanese university

graduates have with the last refinements of experimental skill studied its powers, finding it a "miracle of nature's machinery." By the firefly's infinitesimal dynamo, a pure cold light is produced at "one four-hundreth part of the cost of the energy expended in a candle flame."

Between the condensed stories from native sources and the author's own studies, comes another picture of a graveyard which is unusually rich in wooden text boards and stone Buddhas. The translation of a woman's diary, touching in its simple pathos and simplicity, and showing the real woman's life as it is lived by thousands of poor folk in Tokio, pictures reality better than any foreigner could possibly do it. It is the story of a shy and gentle woman suddenly becoming, by parental dictation, the wife of a total stranger, and bravely resolving to win affection by docility and by faultless performance of duty. The traits revealed are typical of the moral character of a woman of the people. Four or five other papers, as light in texture as the spider lines across the lens of a telescope, but as exactly true and as effective for correct measurement of things which to the Occidental mind are as far off and mysterious as the planets, close a book which is rich in manifold elements of fascination.

The Lightning Conductor: The Strange Adventures of a Motor-Car. Edited by C. N. and A. M. Williamson. Henry Holt & Co. 1902.

The ship, the saddle-horse, the four-in-hand, the railway, have all been amply celebrated in print—even the bicycle has had, these late years, no small share of attention; and now it is the turn of the automobile. 'The Lightning Conductor' is a travel-sketch threaded upon so much of a plot of love-making that it may almost be spoken of as a novel. At any given point the travelling preponderates, so that the hero and heroine may be spoken of as tourists that fall in love rather than lovers that make a tour. Molly Randolph is a rich and handsome American girl, with a doting papa—at home—an unlimited letter of credit, and, to play the proprieties, an entirely complacent Aunt Mary. She was intending some sort of pleasure journey on the Continent when an impressive-looking acquaintance they met in an English village induced her to make it in a motor-car, for the purpose of getting rid of one that he wanted to dispose of. It proved to be "a German monstrosity driven by a jockey-pulley, an apparatus fiendishly contrived for breaking belts quickly." The lesson inculcated is that one should have a gear-driven instead of a belt-driven machine, and preferably something like the "beautifully planned Napier" of the hero, who opportunely comes to the rescue.

Almost everything disagreeable happens to the "jockey-pulley" machine that could happen: belts, chains, and exhaust-valve springs snap, crank heads grow overheated, and finally the chauffeur absconds with a sum of money. At this moment arrives a distinguished young Englishman, John Winston, travelling in his own auto; he is smitten with the charms of Beauty in Distress—and the descriptions of her high-bred type of looks and personality make this fully intelligible—and, on a sudden inspiration, manages to pass himself off upon her as a chauffeur by profession and get taken into her service. His place is no sinecure: he is seen, in the throes of repairing, even lying down on his back under the car, while green oil drips into his hair, and occasionally he has to dine at the servants' table; but he carries it all off in knightly fashion, and, after the canons of good literature with regard to the hero, nothing really degrading to his dignity is allowed to happen to him. The odious car, too, burns up, and he contrives to have the party go on in his own, which he ingeniously affects to charter. He, of course, is the Lightning Conductor.

The story is told under the form of letters—not quite the best mode of telling; one series from Miss Randolph to her father, and another from Mr. Churchill to his friend, Lord Lane. The necessary amount of trouble for a complication is supplied chiefly by a blundering young Anglomaniac and amateur Sherlock Holmes, one Jimmy Payne. The plot, as has been implied, is slender, but we are not dependent upon plot in the case; we are only too well satisfied to go on with such delightful people, and especially through such delightful scenes, on any terms. If the leisurely, the luxurious, classes of society are really producing types like these to any great extent, they don't deserve the abuse they so often get; and, if not, here are pages to which they might turn for emulation with profit. Churchill, the pretended chauffeur, is a most gentlemanly fellow; there is nothing of the "Barnes of New York" about him, starving the girl into docility; he is uncommonly delicate in avoiding any abuse of the opportunities open to him, and no equivocal situation whatever arises. If he only were not always quite so successful, if he would occasionally make a mess of it, he would be a little nearer to real life.

The line of travel is among the châteaux of the Loire, to Bordeaux, a corner of Spain, Toulouse, Carcassonne, Marseilles, the French Riviera, the Italian Riviera, Pisa, Rome, Naples, Capri, and finally Taormina. This is old ground, but the unusual method of locomotion and a fresh touch give it a new and living interest. It is difficult to cover so much ground in a narrative and escape mere cataloguing, yet this is capitally done here, with a light, graceful, accurate mention devoted to some places and very satisfactory fulness to others. The book will foment the automobile movement; Miss Randolph is as enthusiastic about it now as we all were about the bicycle once. It should be a good practical guide, too, to those about to go over the same course, while its charming descriptions of travel afford an ample new fund of pleasure, tinged with envy here and there, to the stay-at-homes.

London before the Conquest. By W. R. Lethaby. The Macmillan Co. 1903. Pp. 217.

In a happy phrase, Mr. Lethaby speaks of London as "a great palimpsest." The older writings have been destroyed by time or are now hidden by the accumulations of ages of débris and rubbish. Roman pavements lie twenty feet below the present surface, and over them is piled the waste of centuries. The deep excavations for modern buildings now and again bring to light a word of the original manuscript, but it is at best only a little fragment here and there laid bare for a moment. Of pre-Roman London we know nothing. We do not know the limits of Roman London. After the Romans comes a great blank; then, gradually, we get glimpses, increasing in number and definiteness from the Conquest onwards till at the end of the sixteenth century we have Stow's monumental 'Survey,' and the wonderful view-map in Braun and Hagenberg's collection of views of the greatest cities of the world. It is, of course, the darkest period of London history and topography that Mr. Lethaby has undertaken to illustrate. The materials are scanty, uncertain, hard to read. "Antiquities," said Lord Bacon, "or remnants of history, are, as was said, 'tanquam tabula naufragii,' when industrious persons, by an exact and scrupulous diligence and observation, out of monuments, names, words, proverbs, traditions, private records and evidences, fragments of stories, passages of books that concern not story, and the like, do save and recover somewhat from the deluge of time."

Where our knowledge is so scant and broken there is naturally room for great divergence of opinion. Take, for instance, the following from Mr. Lethaby: "In the 'Conquest of England,' Mr. Green stated the view that Saxon London 'grew up on ground from which the Roman city had practically disappeared.' . . . My view of Alfred's London is that the Roman city to a large degree continued to exist." Research has, it is clear, left sufficient room for play of imagination. The intrepid explorer is not to be denied. He may draw courage from the assertion of Sir Thomas Browne that "what song the Sirens sang, or what name Achilles assumed when he hid himself among women, though puzzling questions, are not beyond all conjecture." Of a truth we hardly know which task would prove the more difficult—the recovery of the Sirens' song or the determination of the topography of Saxon London. We are not quite sure that all has been done that might be done towards coördinating our knowledge of, say, Roman London, by carefully mapping the sites of relics discovered at different times. London lore is scattered in endless books and transactions of various societies. Some day, perhaps, the man will arise who will weld our scraps of knowledge into some sort of a whole.

Mr. Lethaby's knowledge of his subject is great; he has studied documents at first hand; he is possessed by enthusiasm for old London. To the outside public, Billingsgate is a mere fishmarket, known, indeed, throughout the English-speaking world for its vocabulary, more vigorous than elegant. Mr. Lethaby tells us: "For me the old British solar God lights up the squalor of Billingsgate." "London," he says, "is rich in romantic lore. In her cathedral, Arthur was crowned and drew the sword from the stone. Here Iseult attended the council called by King Mark. From the quay, Ursula and her virgins embarked; Launcelot swam his horse over the river at Westminster, and from it Guinevere went a-maying." Mr. Lethaby's industry deserves our gratitude. But the impression left by his book is confused. In the several chapters on the Rivers, the Roads, and the Bridge, the Walls, Gates, and Quays, and others, we are hurried back-

wards and forwards till the brain reels. Only in the last chapter do we come to Roman London. But, though we could have wished for method, a better arrangement of matter, and the help of an index, we welcome Mr. Lethaby's contribution to an inexhaustible subject. There are many good illustrations of British, Roman, and Saxon antiquities.

In an appendix, Mr. Lethaby makes some remarks on the map to which we have referred, that in Braun and Hagenberg's 'Civitates Orbis Terrarum.' Its great value is fully recognized by Mr. Lethaby. He questions the contention that, as it shows the spire of St. Paul's (which was destroyed by lightning in 1561), the map (or, to be exact, the drawing from which the map was made) must be earlier than the date of that work (1572-3). He himself would date the map "about 1570." Examination of the names of houses shows, we think, that the map was drawn between 1553 and 1557. Nor can we accept what appears to be Mr. Lethaby's view that Braun's map is original. A publisher of that time would, no doubt, just as he would to-day, collect the best maps available, and reëngrave them. Mr. Lethaby is, perhaps, not aware that this was actually done in the case of one English map in the collection, that of Norwich. This was reëngraved with great exactness from the map given in William Cuningham's 'Cosmographical Glass,' published in 1559, the map itself bearing the date of the previous year. The detail of the map of London is so extraordinarily minute that it appears probable that the original map was on a scale considerably larger. Even as it is, the engraver has had to reduce the map to the required size by giving the Thames a severe bend at Charing Cross. The map is, in other respects, so accurately drawn that this seems the only reasonable explanation of the exaggerated bend.

The Primrose and Darwinism. By a Field Naturalist, M.A. (Cambridge). London: Grant Richards; New York: E. P. Dutton. 1902.

Every note of this work is struck in the wrong key. In the first place, the recorder of observations in themselves interesting has chosen to conceal his identity under a pseudonym, whereas he should have put it in the power of every inquirer to place himself in communication with him for further information, if need be. In the second place, the author has forgotten that his notes, as notes, so far as they contribute anything to the knowledge of the subject, would have pleased Mr. Darwin, an investigator who was always ready to check his observations by those of others. But, instead of making these notes a kindly commentary upon Mr. Darwin's study of the Primrose, the anonymous author forces them to do service in ungenerous polemic. Even this contentious tone would perhaps be pardonable if the author showed at any point in his work that he is familiar with modern methods of research. But there is no internal evidence that the author has prosecuted his studies under competent guidance since the days, long ago, when, as he says, he was a pupil of the lamented J. S. Henslow at Cambridge. Almost every modern teacher of repute would have urged the author to seek for "the calm and catholic judgment" which Huxley justly ascribed to Professor Henslow. At all events, the exercise of a calm and catholic judgment would have rendered these pages pleasanter reading, and would have lessened the unavoidable feeling of antagonism which they excite. Under the influence of calm and catholic judgment, the author would realize that even his imperfect observations and his comments upon them would have been welcomed by no one with more kindly interest than Mr. Darwin himself. But instead of taking this judicial attitude, the author places each alleged fact as a chip on the shoulder, and defies the reader to knock it off. Such is not the attitude of dignity or conciliation.

The main contention of the author appears to be that Mr. Darwin was an unskilled experimenter, and was not justified in drawing certain conclusions from his observations on the Primrose. The story is now very familiar, but it may bear repeating.

The common English primrose has two sorts of flowers, namely, those with a long style which brings the receptive stigma close to the top of the tube of the blossom, and a second kind in which the style is short, reaching about half-way up the tube. The first blossoms, with the long style, carry their anthers, the little sacs of fertilizing pollen, only half-way up the tube, while the short-styled blossoms bear their anthers at the very brim of the tube; or, in other words, just at the level of the stigma on the long style. There is, thus, a correspondence between the two sorts of flowers; they seem to have reciprocal relations. By long observation, and by what has been hitherto regarded as most careful experimenting, Mr. Darwin showed that these apparent reciprocal relations are truly reciprocal, and that the pollen of the long-styled blossom is more potent on the stigmas of the flowers of the short-styled sort, and vice-versa. Many other plants besides the primroses have this double reciprocity, and all such are collectively known as dimorphic. There are certain other plants which have a trimorphic character, and a few are polymorphic. Insects play a very important part in conveying the pollen from one form in a given species to the other form or forms of the same species; thus, from the short-styled, pollen is carried to the stigmas of the long-styled, and conversely. Upon these plants Mr. Darwin experimented.

In the experiments under review, Mr. Darwin excluded by means of fine gauze all insects which might have conveyed pollen from and to the plants. The author claims that the employment of such a net over the blossoms introduced unnatural conditions. These conditions are said by him to be, in part, (1) the diminution of the influence of the solar rays, in passing through a close-meshed net; (2) the prevention of radiation, and the consequent lessening of the amount of dew received by the flowers; (3) absence of wind, which might shake the blossoms and scatter pollen. These objections should be shown to be valid, and they can be so shown only by long-continued control experiments. Careful perusal of these pages fails to show that the author has made or reported such experiments. We have his assertion that these objections are valid, but nothing else to prove that they are valid. To claim at this stage in the development of the science of botany that it is disadvantageous to blossoms to deprive them of dew, or diminish its quantity, requires a good deal of nerve on the part of the claimant. To assert that the absence of wind, with its aid in shaking the blossoms, was a fatal element in Mr. Darwin's experiments, indicates that the author has not read Mr. Darwin's account with sufficient care. The anatomical features pointed out by Mr. Darwin are apparently not appreciated by this Field Naturalist, and they are too lightly passed over to justify us in thinking that the author is judicial in his treatment of the matter.

The position which our author takes with respect to experimentation is amusing and pathetic. It is hard to think that any observer or investigator should willingly cut himself off from the aid of one of the most trustworthy handmaids in research, namely, experiment. And yet, incredible as it may seem, the author gravely writes this:

"We consider that it was most unfortunate for Natural Science that Darwin relied almost so exclusively on artificial observation, or, in other terms, on experiment, for the investigation and interpretation of natural laws in facts connected with the fertilization of flowers." (Preface p. vii.)

"Darwin's use of the net and his method of investigation not only misled Darwin himself as to facts of Nature, but his conclusions drawn from such methods of investigation have misled for an entire generation those of his ablest followers, who without questioning accepted his method and conclusions." (P. 226.)

The author's definition of experimentation as artificial observation, and his strictures upon it because it is artificial, are interesting. His prediction as to the ultimate result of the use of experimenting is likewise interesting, not to say, entertaining:

"In this field of research we cannot suppose it possible that Darwin's conclusions from his net experiments, and his numerous theories founded upon them, will be abiding. In fact, it involves a decision between results obtained under a net, with sun, wind, and atmospheric influences generally minimized, and the results as seen in the fields; *i. e.* a decision between Net-ism and Naturalism. It needs very little prophetic insight to foretell that the results obtained by the former method will, in the course of another generation, be discarded in favor of the latter." (P. 226-227.)

Probably the author would say that he does not object to experimenting, as such, but only to Mr. Darwin's experiments. Since, however, no experimental proof is offered that Mr. Darwin did not experiment properly, we must look a little farther to see whether the author's objections do not lie against conclusions rather than against methods. On page 226, we read:

"If, however, Darwin's conclusions as to dimorphic and trimorphic flowers are unsubstantiated, and his experiments invalid on account of the invalidity of his method of experimenting, the boundary-line between species and varieties still remains unmoved."

Now, no one can doubt that changes are going on relative to some of Mr. Darwin's conclusions respecting the scope of cross and close-fertilization, but these changes have not as yet much disturbed any of the primary questions. Least of all do these slight changes make it easier to go back to the time, say sixty years since, when the author studied under Henslow of

Cambridge, when species were fixities and varieties never invaded their domain, to stay.

First-Hand Bits of Stable Lore. By Francis M. Ware. Little, Brown & Co. 1903.

In this little volume the author covers a wide range of subjects, from buying a horse to four-in-hand driving and the management of a pack of hounds. He starts out by crediting horsedealers with being reputable business men. This seems at first blush unnecessary, yet, upon further consideration, how seldom does one meet a friend who has the intention of investing in a horse without hearing him express a fear that he may be deceived. The author is quite right in advising that in such matters you put yourself in the hands of a reputable dealer unless you know what you want and are entirely able to select for yourself. Even with the price, quality, and general character agreed upon, a horse may or may not fit a rider. This may not count for much for an occasional ride, but for the habitual horseman a fit is essential to comfort. The advice that a horse once bought should be constantly used cannot be too often repeated. Many serious accidents have happened through allowing horses to stand without exercise, particularly when the weather is first turning cold. When one considers the careless disregard which obtains in this matter, it is a wonder that more accidents do not occur. A horse should never be regarded as perfectly safe unless you are entirely certain that nothing unexpected is going to happen in his vicinity.

The chapter on soundness, coming as it does from one of so great experience, deserves serious attention. It is true, as the author states, that many veterinarians are not "horsemen"; he might go further and say that very few veterinarians are good horsemen. This accounts to some extent for their frequent inability to judge just what allowance should be made in case of defects. The sharp criticism on governmental requirements is justified by the fact that, notwithstanding the careful specifications and scrupulous inspections, the service frequently finds itself possessed of numerous undesirable animals. It should be remembered, however, that the Government buys cavalry horses at from four to eight years of age, a period during which an animal is apt to develop most of the defects to which he is liable. The Government should devote more attention to educating inspectors in order that they may be depended upon to waive immaterial defects, for one seldom finds a perfect horse without blemish or disqualification of some kind. It is true that many horses which have developed unsoundness continue for many years to render good service; nevertheless, the enormous weight carried on cavalry horses, averaging more than 250 pounds, demands serviceable soundness and conformation.

The chapter on stables and stable management contains many valuable hints. Ventilation without draughts; cleanliness without the odor of disinfectants; clean food given at frequent intervals, comprise the basis of advice along these lines. Of all the ills to which the young horse is subject none is more exasperating than influenza, which is induced by change from country pastures to city stables. The disease is known under many names, and seems to extend with great rapidity among young horses in the same stable. It often leaves the horse in a very weak state for a prolonged period, and not infrequently ends in pneumonia. It requires the utmost care in nursing and feeding to put the colt on the road to recovery and keep him mending. All this seriously interferes with the horse's education, which should be commenced as soon as purchased. During the recent war with Spain the disease created much havoc in the large volunteer camp at Chickamauga Park, where nearly 50,000 men, including a considerable proportion of cavalry, were assembled at one time.

The author indulges in some very pointed remarks concerning the relative value of the gaited saddler and the walk-trot-canter animal more commonly used in the East and North. In the South and many parts of the West the single-foot or rack is regarded with much favor, and is considered as the most comfortable gait for the rider. That it is not so for the horse, is made evident by the constant tendency of the animal to change his gait unless ridden up to the bit. Some animals descended through several generations of saddle horses perform at a single-foot much more easily than others, and are quite generally spoken of in the South as "born saddle-horses" in contradistinction to animals which always show the artificial nature of their gaits, particularly "the rack." Nevertheless, gaited saddlers continue to bring remunerative prices in country districts, although they are no longer salable in Eastern cities or for army use. There is nothing more exasperating in a cavalry command than an officer or sergeant leading a column at a single-foot or rack, for the animals trotting in the ranks can never properly regulate their gaits under such leadership. The best physical results from horseback riding are undoubtedly obtained at a trot, although some animals are entirely too rough for pleasant riding.

On the hunter and the steeple-chasers the author has some very practical hints. The discussion of the relative merits of the "flying" jump and the deliberate or bucking-over style of taking a fence is of more than ordinary interest. Owing to the big, lumbering character of many hunters, the flying jump is not so common as might be the case if lighter and smaller horses were used. If no accident occurs, it is easier to retain a close seat on the fast flying jumper, but rushing at obstacles is not the safest thing in the world. The picture of a "good form" jump opposite page 160 is pleasing to the eye at first glance, but is one more proof of the seeming impossibility of obtaining just the photograph desired for illustrating a book on the horse. The position of the heel of the rider is such that a spur, if worn, would rip the side of the horse in a cruel manner. The rider appears to be supporting himself by the curb reins in a way which does not accord with the author's advice.

Four-in-hand driving and coaching are treated of in two chapters in a manner to give the amateur the correct impression that if he wishes to be accomplished in either he must take to the box and "do things." Many books and essays have been published which convey the idea that one's appointments are the real thing, but as a matter of fact it is the coolness, experience, and ability to really drive four horses in a mix-up that make the lasting reputation.

Chapters on showing horses and the management of a pack of hounds close this interesting volume.

BOOKS OF THE WEEK.

Baedeker, Karl. Southern Italy. Leipzig: Baedeker; New York: Scribners. $1.80.

The Path of Evolution

Through Ancient Thought and Modern Science

By HENRY PEMBERTON

Member of American Philosophical Society, Academy of Natural Sciences, Historical Society of Pennsylvania, etc.

A comprehensive survey of philosophy and learning, illumined by a wonderfully lucid and simple style; a treatment of the evolution of knowledge and the evolution of life, establishing a connected historical relation and applying the deductions of science to the problems of life. A thoughtful book that gives easy grasp of a difficult study.

The author has sketched the story of the progress of human knowledge in many different lines. . . . He has read widely and thought wisely.—*Outlook*, New York.

One of the most successful attempts ever made to popularize the conclusions reached by scientists and philosophers in the various fields of human inquiry. . . . Singular clearness of exposition. . . . Studious avoidance of technical language.—*New York Sun.*

It admirably supplements the writings of Herbert Spencer, John Fiske and others, with masterful grasp and intelligence The style is clear, concise and dignified, as befits so grave a subject.—*Public Ledger*, Philadelphia.

The subject is phrased in such a simple style that the large class of people outside the circle of scientists can comprehend it.—*Post*, Washington.

The book impresses one as being thoroughly comprehensive . . . lucid and pleasant to read.—*New York Commercial-Advertiser.*

Mr. Pemberton throws light on the things which are intangible and remote, but which all classes of mankind are interested in.—*Globe-Democrat*, St. Louis.

His purpose is to enable us to steer clear of positivism, agnosticism and materialism, and to discern amid all . . . a wise, intelligent volition.—*Free Press*, Detroit, Mich.

His work contains an immense amount of information, but more important are the conclusions he comes to. . . . His view is broad, hopeful, helpful and attractive in style.—*Evening Telegraph*, Philadelphia.

In many respects the most important book of many months. . . . Those who want to know what scientists claim at present will find it better set forth here than in any other work of which we have knowledge. . . . All will find it a work of intense interest.—*Philadelphia Inquirer.*

Cloth, 12mo, xxiv+374 pages, $1.50 net. Postage 15 cents. At all booksellers, or from the publisher,

NO. 66 SPARKS ST., CAMBRIDGE.

The Residence of the Late HENRY W. PAINE, Esq.

The property consists of a framed-roof dwelling-house and lot of land on one of the best residential streets in Cambridge. The Huron Avenue electric cars pass one end of the street and the Mt. Auburn and Watertown cars pass the other, at frequent intervals. The lot faces south and has unobstructed sun. It is about 108 feet in frontage and 133 feet in depth, containing nearly 14,400 square feet of land.

The house is well placed in the center of the lot; has, on the ground floor, drawing-room, library, dining-room, kitchen, and small laundry, on second floor, four large bedrooms, with large and sunny hall, and bath room; and in the attic two large and two smaller bedrooms.

There is a caretaker in the house, and it can be seen at any time. For terms apply to Room 1002, Exchange Building, 53 State Street, Boston.

Charles Scribner's Sons' New Books of Importance

THE PRINCIPLES OF MONEY

By J. Laurence Laughlin, Professor of Political Economy in the University of Chicago. 8vo, $3.00 *net* (postage 21 cents).

An elaborately organized treatment of the principles of money and an original and novel contribution to the science of political economy.

DEVELOPMENT OF MUSLIM THEOLOGY, JURISPRUDENCE, AND CONSTITUTIONAL THEORY

By Duncan B. Macdonald, Professor in Hartford Theological Seminary.

To the general reader it will open a new world of interest and information, and to the specialist it will give the latest data on its complicated and difficult theme. $1.25 *net* (postage 11 cents)

OLD TESTAMENT CRITICISM AND THE CHRISTIAN CHURCH

By John E. McFadyen, M.A., Professor in Knox College, Toronto.

A popular, complete, and truly constructive work. It is the Higher Criticism controversy in a nutshell and for lay as well as clerical readers. $1.50 *net* (postage 16 cents)

AGNOSTICISM

By Robert Flint, D.D., LL.D., Professor of Divinity in the University of Edinburgh. 8vo, $2.00 *net* (postage 20 cents).

"Dr. Flint's eminence among representative writers upon Theism commands attention to his treatment of Agnosticism. No writer that we are aware of has treated it so amply and thoroughly as here."—*The Outlook.*

SHAKESPEARE AND VOLTAIRE

By T. R. Lounsbury, Litt.D., LL.D., Professor of English in Yale University. 8vo, $2.00 *net* (postage 16 cents.)

"Presents for the first time a complete story of the relations held by Voltaire to Shakespeare."—*Boston Transcript.*

SHAKESPEARE'S PORTRAYAL OF THE MORAL LIFE

By Frank Chapman Sharp, Assistant Professor of Philosophy in the University of Wisconsin. 12mo, $1.25 *net* (postage 10 cents).

"An American Classic."

MOUNTAINEERING IN THE SIERRA NEVADA

By Clarence King. $1.50

"It is literature of a rare and distinguished quality. Though a man of science, King looked at nature through the eyes of a poet, and he knew, as few of his calling have known, how to share her magic with his readers."—*New York Tribune.*

NEW SCRIBNER FICTION.

To Be Published This Saturday

A GIRL OF IDEAS

By Annie Flint. $1.50

This very unusual novel details the business career of a girl whose imagination is her only capital. Publisher after publisher rejects Elinor Day's manuscripts. Her money runs low. Refusing to accept defeat, she opens an office for the selling of ideas to established writers. The scheme meets with instant success. She becomes a distinguished author—by proxy. Many complex situations develop, the solution of the most embarrassing of which constitutes the climax of the book.

THE HOUSE ON THE HUDSON

By Frances Powell. $1.50.

A very remarkable first novel, by a new writer who tells a strikingly unconventional story. From the moment Miss Athena Derohan arrives at Highgrove Hall, young, beautiful and unprotected, the chivalrous interest of the reader is awakened, only to be still more potently stimulated by the mysterious developments which follow. The whole romance, blending the characteristics of a detective story with those of a passionate and forceful drama of love, is one of peculiar originality.

Published During the Last Few Weeks

THE BETTER SORT. *2d Edition.*

SPRING IS COMING

ZOLA'S New Novel

FINISHED JUST BEFORE HIS DEATH

Truth Truth Truth

TRANSLATED BY E. A. VIZETELLY

12mo, $1.50. Just Out

Second Edition. Eleventh Thousand

This novel is the third of the group called "The Four Evangelists." Its plot is virtually a resetting of the celebrated Dreyfus case. The story sustains from cover to cover the reader's excitement and interest in a vivid dramatic situation.

The *Baltimore Sun* says: "A strong book; a fearfully strong book; the strongest novel Zola produced."

New Letters and Memorials of Jane Welsh Carlyle

A COLLECTION OF HITHERTO UNPUBLISHED LETTERS. EDITED, WITH AN INTRODUCTION BY

SIR JAMES CRICHTON BROWNE

Profusely illustrated in photogravure and lithography from hitherto unreproduced originals. In two volumes. Buckram.

8vo. $6.00, net. Ready shortly. Order at once

Mrs. Carlyle's letters are introduced and annotated with Thomas Carlyle's own characteristic tender comments, and entirely subvert James Anthony Froude's theories of their domestic relations.

A New Novel by

MRS. WILFRID WARD

The Light Behind

12mo. $1.50. Just Out

Mrs. Ward's previous novel, "One Poor Scruple," was a deft handling of one of the problems presented by Roman Catholic influence on modern society.

AN INTERESTING STUDY BY

EDMUND J. CARPENTER

The American Advance

A Study in Territorial Expansion, with a map showing the growth of the United States of America from the beginning to the present day.

Illustrated by MAURICE GREIFFENHAGEN

By the author of "Beatrix Infelix," "Rupert, by the Grace of God," etc., etc.

A New Nature-book by

CHARLES GOODRICH WHITING

Walks in New England

With 24 Full-page Illustrations from Photographs

Large 12mo. $1.50, net. Ready shortly. Order at once

The same author's charming volume, "The Saunterer," together with the well-known columns in the *Springfield Republican*, makes Mr. Whiting familiar to readers as a poet and essayist drawing his inspiration from Nature.

A New Novel by

VANDA WATHEN-BARTLETT

The Gap in the Garden

Decorative Boards. *12mo. $1.50. Just Out*

By the author of "Heart's Desire."

N. Y. Times Saturday Review: "A story which deals with supposed mental atavism. The occult is developed unknown to the *dramatis personæ*, but perfectly visible to the reader. When a certain baleful influence is withdrawn, the characters seek their natural partners—like masqueraders at a ball when the disguises are thrown aside."

A New Series of OUT-DOOR Books is being published by John Lane, called

The Country Handbooks

Edited by HARRY ROBERTS, Editor of "Hand-books of Practical Gardening," etc., etc.

The record of a journey taken during the spring of 1902 over this first great enterprise of the Twentieth Century. The writer has endeavored to place himself in the position of the Russians and to give their ideas upon their greatest work.

G. P. PUTNAM'S SONS, New York and London

The Nation.

NEW YORK, THURSDAY, APRIL 2, 1903.

The Week.

The *Evening Post* prints, from a trustworthy correspondent in Manila, an account of the brutalities practised upon Filipinos by a regular army officer, Capt. R. L. Howze. In this case the protests have come, not from any Anti-Imperialists or "calumniators of the army," but from army officers themselves, who are unwilling that the service shall bear the disgrace of Capt. Howze's acts without some effort to punish him. Graduates of West Point and veterans of many years have preferred the charges, and to Gen. Miles is due the credit for the careful probing of the matter. So far, the War Department has taken no action in the matter, and Capt. Howze still holds advanced rank in the Porto Rico Regiment, just as he received the grade of brigadier-general of volunteers for his alleged "brilliant services" in the Philippines. His case and others have been treated at length in Gen. Miles's report of his trip to the Philippines. But this report is the very one the War Department has suppressed, on the ground that it partakes of the nature of an inspection and is, therefore, confidential. Neither the public nor the service is thus to have an opportunity to learn the views of the Lieutenant-General and to judge of their correctness. We are informed that Gen. Miles does not confine himself merely to these cases, but that his opinions of the condition of the troops and their state of discipline would make extremely interesting if not sensational reading.

Gen. Wood has departed for the Philippines, but the scandal of the *jai alai* gambling establishment in Havana continues. It appears now that its franchise was granted for ten years, and that the interpretation given to it by the attorneys of the proprietors was confirmed by Gen. Wood in the *Official Gazette* of May 9, 1902. In Secretary Root's mind there seems to be no doubt that this concession was rightly bestowed because of the harmlessness of the game itself and its national character. But, as the game is played in Havana, it is merely a means to an end—to enable the syndicate to make enormous sums out of the open betting carried on. It is as if Messrs. Farrell and Canfield should start a handball court in this city, and take 10 per cent. of the bets placed upon the professional players employed by them. The game may be "national," but it is by no means so much so as cockfighting. Yet the latter has been stopped both in the Philippines and in Cuba. What would have been thought if Gen. Wood had licensed bullfighters in Havana and given them an exclusive ten years' privilege?

In commenting upon the formation of a general staff for the army, we expressed the opinion that it might become either a great benefit or a great injury to the service, according to the manner of its administration. Its protection from the blight of politics is so absolutely essential to its efficiency that it is gratifying to record Secretary Root's action in appointing a board of generals to select the officers who shall constitute it when it begins work in August. This is undoubtedly the fairest way in which the choice could be made, particularly as it has been feared in army circles that the officers nearest to the Secretary might be able to influence the selections in favor of themselves or their friends. Gen. Young's board has, moreover, given a striking proof of its desire to do its work on the basis of merit only, by inducing Mr. Root to rule that only such applications and endorsements of officers shall be considered as are forwarded through the regular military channels. This should prevent endless wire-pulling, and preserve the board from being overrun by the wives and sisters and Congressional friends of aspirants. The composition of the board—a remarkably strong one—is in itself sufficient guarantee that every officer of merit will be considered, even if now absent in the Philippines. If this policy is consistently pursued, these positions should be the greatest prizes in the army, and selection for them should, alone, attest the exceptionally high professional standing of the officers so honored.

At last both houses of the New York Legislature have been permitted to vote squarely on the question of submitting to the people a broad scheme of canal improvements. The result is the passage of the referendum bill by large majorities. This outcome is all the more striking from the fact that practically the entire legislative machinery was in the hands of men from the anti-canal counties, ready to do all in their power to delay and, if possible, defeat the bill. The Republicans in the Senate, when they act together, have a working majority, but of the thirty-two votes cast for the bill in that body only eleven came from the dominant party. Likewise, in the Assembly, but thirty-two of the eighty-nine Republicans favored the improvements. This circumstance is easily explained, since the Republican majority comes chiefly from the rural districts. That the Canal bill was able to make its way against opposition of this sort is, however, a remarkable proof of the vitality of its support. Of course, this is really due to the fact that the commercial supremacy of the State, as well as of the port of New York, is involved in the canal question. The passage of grain for export through New York has steadily fallen off from year to year as the Erie Canal has become a less and less efficient carrier in comparison with modern transportation facilities. Railroad improvements have progressed without interruption, but the canal has remained practically stationary since the sixties; the wasted expenditure of 1897 representing the only attempt at substantial betterment. But railway development has not enhanced the relative advantage of this port as a point of departure for foreign freights. Its tendency has, in fact, been exactly the contrary. With the water route practically abandoned, New York has been obliged to take its chances in railroad competition with Portland, Boston, Philadelphia, Baltimore, Newport News, and even with Savannah.

These are the considerations which have induced the Legislature to propose to the people a bond issue of $101,000,000 for the purpose of improving the Erie and Champlain Canals so as to enable them to accommodate canal barges of 1,000-ton capacity, operated in fleets. Even in these days of great enterprises, the expenditure involved appears to be enormous. And so it is, but the project is surely no more stupendous than that of 1817, when, with a population of little over 1,000,000 persons, the State undertook to "open communication between the Hudson River, Mohawk River, Seneca River, and Lake Erie," and actually completed, by the autumn of 1825, a four-foot canal 363 miles long, with eighty-four locks, capable of passing boats of eighty tons capacity. "It is not to be supposed," said Mr. Carnegie not long ago, "that the city and State of New York will fail to protect their position by improving the weapon which New York State, alone of all the States, has in her waterway from the lakes to the port of New York." The action of the Legislature indicates that Mr. Carnegie was right.

If organized labor has ever gone into a more idiotic strike than that of the structural ironworkers on the subway, in this city, we cannot at the moment recall it. There is absolutely no local grievance. The men were at work under an agreement with the contractor, made last November, but this they have trampled upon, as if their word were no better than the mud in the gutters—and all for what? Why, the American Bridge Company, which furnishes material for

the subway, is employing a few non-union men in Pittsburgh! That renders the iron "scab," of course, and the unionists here cannot consent to defile their hands by touching it. Hence the strike, in flat violation of their agreement, and hence the threat to call out 45,000 workmen to fight the American Bridge Company, the Steel Trust, and all creation. Two things are to be observed in connection with this senseless strike. One is that it comes hard upon the report of the Strike Commission, which spoke out so emphatically for the rights of the non-union laborer and called upon the unions to cease discriminating against him. We were told that this would have a great effect in diminishing the intolerance of labor unions; they would be more considerate of the free workman. Let the attitude of the ironworkers provide the fit comment on that prophecy. They are filled with hatred of the non-union man, and care not how much they inconvenience the public. This is the second thing to note about this strike: it sets the good of the city at open defiance. What do we care how long you have to wait for your subway? It used to be the selfish capitalist who said, "The public be d—d!" Organized labor has changed all that, and is now the great disregarder and curser of the public.

The State of Indiana seems to be a centre of disturbance in the field of organized labor. Dispatches from Indianapolis a few days since announced that the non-union men in the town of Anderson had formed an organization to protect themselves against the tyranny of the unions. This movement among independent workers seems to be spreading. Its declared objects are to oppose boycotts and blacklists; to improve the condition of wage workers by harmonious coöperation with employers; to compel public officers to enforce the law for the protection of all citizens; to provide an employment bureau for members, and in general to build up rather than break down American industry. A later dispatch tells us that the business men of Evansville, Ind., to the number of one hundred or more, have formed an anti-boycott league, to save themselves from the torments of organized labor. It is said that three boycotts are raging there now. The latest has been proclaimed against the Evansville Gas Company. In order to compel this company to accede to certain demands, the boycotters have ordered other employers of labor to stop using gas, under penalty of having their own employees "called out," although the latter have no complaints to make.

This is the sympathetic strike and the boycott combined. It proceeds on the hypothesis that the interests of the original strikers (the gas stokers), who must be a relatively small part of the inhabitants of Evansville, are of such transcendent importance that all other persons and things should give way to them; that all others should take up their fight without knowing its merits or even inquiring what it is about. The theory is, that if a sympathetic strike or a boycott depends upon reason or argument, you might as well abandon the system at once, because debate might go on forever. Therefore, if A makes a demand on B which is refused, C, D, and E must drop their own tools and join A in coercing B. If they refuse to do so, then all the rest of the alphabet must withhold patronage from A, C, D, and E. It is plain that if the rest of the alphabet assert their right to buy and sell where they please, to ride in street cars, to keep their gas meters, and to draw their breath in their accustomed way, boycotting will soon come to an end. We shall watch the outcome of the Evansville experiment as that of a new declaration of independence.

The burning question of the Chicago municipal campaign is the renewal of the street railway franchises, which are about expiring, and the granting of franchises for extensions. The north and west divisions of the city were under the firm control of Mr. Yerkes until he kindly removed the sphere of his influence to London. His Chicago belongings have fallen into the hands of the Elkins and Widener school of Philadelphians, of which Yerkes himself was a former head-master. Mayor Carter Harrison is understood to favor, in a mild way, municipal ownership of street railways and other public utilities, but the issue between himself and his Republican competitor in this particular is not sharply drawn. In fact, this question is not to be decided by the Mayor, but by the Common Council, and here the great Voters' League holds the commanding position. Astonishing as it may seem, the citizens of Chicago actually control the city government. No rings of capitalists, or of gamblers, no bosses, no syndicates have any power worth mentioning as against the great Voters' League. Neither Yerkes nor his successors, neither the Gas Trust nor the electric lighting people, neither city railways nor other railways, can buy a franchise in Chicago or procure one on terms that will not bear public investigation. The question is often asked how it happens that Chicago holds this unique position among the greater American cities. The reason is that for twenty years she has had an organized body of citizens, composed of both Republicans and Democrats, who have made municipal politics their chief concern, who have given their time and money and personal service without stint to civic duties. They have shown the same zeal in the purification of public life that the thieves and the thugs have displayed in its defilement. When they took up this work, the condition of city affairs was as bad as bad could be. Tammany Hall under Croker was no worse. The decent people are now so securely in the saddle that they have no fear of the result of any city election. Whether Harrison or Stewart shall be elected on the 7th of April, the Common Council will be the power behind the throne and above the throne, and it will be the representative of the great Voters' League.

Even such limited ballot reform as was provided in a bill drawn up by the Republican Committee of Pennsylvania has proved too much for the Legislature of that State, and the measure has been amended out of all resemblance to its original form. The grouping of candidates with the name of each appearing only once has been preserved thus far, however. Straight party voting is, of course, provided for. No restriction is placed on the use of voters' assistants—an evil as prevalent in Pennsylvania as in Delaware. In short, the promise of ballot reform, if carried out at all, is evidently to be fulfilled only in form, not in spirit. No mention whatever is now made of a personal registration law, without which it is quite certain the ballot in Pennsylvania can never be permanently purified. Meanwhile, nothing at all is heard of Quay, whose personal prowess has been so often described by his new friends, the reformers. No one who reads descriptions of Quay given by Gov. Pennypacker and other admirers, would doubt that the Pennsylvania Senator could pass a personal registration law as quickly as a franchise grab or a bill raiding the State treasury. The Philadelphia *Press* remarks sadly of the ballot bill that it is not what those who contended for ballot reform wanted, though it may furnish a "starting-point for the future." But it does not call on Quay for assistance. We wonder why not?

The football rules committee has adopted the principle of open play, and, as a guarantee of effective action at the next meeting, prohibits the use of sole-leather helmets by players. Heads are not hard enough for mass play as at present conducted, and, having deprived the player of his defensive casque, which was also a battering ram at need, they are bound to go further and release him from the obligation of knocking down a compact group of opponents with his head. All lovers of sport will commend this attitude of the rules committee, but will feel that the matter cannot rest at the point of good intentions. Two very simple changes in the rules will bring back the open game—first, the keeping of seven men in the line; sec-

ond, the increase of the distance to be gained in four downs from five to ten yards. This is the irreducible minimum of reform; and faculty committees and others in authority should spend the next fortnight in impressing the fact upon the rules committee.

Who could have expected to live to see protectionists chuckling over a great increase in the imports of those very goods which their tariff was designed to keep out? Yet it is "A Gratifying Showing," they now gleefully tell us, when the figures for the past eight months show large gains in the amount of hides, and wool, and iron, and steel brought into this country. The increases are, respectively, $9,000,000, $5,600,000, and $22,300,000. Ah! but these are all "manufacturers' materials," and the more of them that come to us the better. Then why did you clap on extra duties for the express purpose of excluding them? This protectionist joy is as belated as it is suspicious. In actual effect, under the present circumstances, these enlarged importations have at least three bad consequences. They raise the price to the consumer by the amount of the tariff tax; they make manufacturing just so much the more expensive, thus further disabling the American exporter from competing in the world market; and they throw needless millions more of customs revenue into the Treasury at the very moment when the banks and the general commercial situation can worst spare the money. All told, a "showing" indeed; but of a kind not flattering to the capacity of our tariff-makers.

The fall in British consols to the price of 90 may fairly be called a sensational event in finance. Consols, like other securities, have had their ups and downs. In 1870, for example, when the Franco-Prussian war aroused fear of English entanglement, consols went down to 88½, and they touched 84⅝ in 1866, the year of the Overend-Gurney panic. But no such price as 90 has been reached since 1870. Reasons for this decline are so well known as hardly to need recapitulation. Boer war expenses made necessary the issue, in the three past years, of $610,000,000 new Government stock by England. Supply had therefore increased heavily in the consols market at the hour when demand was reduced by suspension of purchases for the sinking fund. A Transvaal loan of $150,000,000, with a British Government guarantee, is about to issue, and will have to find lodgment in the very quarters where older supplies of consols are at present held. This situation coincides rather unluckily with the date fixed by Mr. Goschen, at the debt conversion of 1888, for automatic reduction, in the annual interest paid on consols, from 2¾ to 2½ per cent. There is nothing illogical in a fall in price, under such conditions, and perhaps nothing surprising even in the drop from 113, in the year before the Transvaal war, to the present 90. A peculiar interest is attached to present developments, however, because they are in a sense the sequel to a novel experiment in British finance. Never before 1901, we believe, did the British Government openly seek the aid of foreign syndicates in placing its public loans. Of the $300,000,000 consols issue of that year, it privately placed half with a New York and Continental syndicate, under whose auspices $50,000,000 to $100,000,000 was sold in the United States, and nearly as much in France. It adopted the same expedient, on a smaller scale, a year ago.

Sir Michael Hicks-Beach was unfavorably criticised for this policy at the time. He answered that such foreign support was requisite to avoid a very low issue price. The rejoinder of his critics was, that the consols market would be injured, later on, precisely as much as it had been helped at the time of issue. It was assumed that consols taken outside of England would presently be sold back; first, because English investors would naturally bid more for them; second, because the British Government charges the 6 per cent. British income tax against all holders of consols, home and foreign, and deducts that percentage from its interest remittances; third, because other markets, when in need of money, would undoubtedly resort first of all to consols as a means of raising it. All this has happened, as Sir Michael's critics said it would. It is not conclusive proof, however, that sales abroad were wrong; nor, for that matter, does it prove present valuations to be permanent. One striking aspect of the case is that while British 2½ per cents—they will bear that rate this week—sell now at 90, the law which authorizes $130,000,000 United States bonds to build the Isthmian Canal, stipulates that those bonds shall be 2 per cents, and shall not be sold for less than par.

Dispatches from Bloemfontein say that the representatives of the South African colonies have signed a convention providing for a 10 per cent. preference in customs duties in favor of Great Britain and of reciprocating British colonies. This is, very likely, a part of the arrangement made by Mr. Chamberlaln—a *quid pro quo* for the British guarantee of the £15,000,000 loan for setting up the Boer provinces. It is not without significance to our trade with South Africa, which has grown largely in recent years, especially in agricultural and mining machinery. The preference shown to Great Britain is not to be complained of, however, since it is our own way of treating colonial trade; *vide* the discriminating export duty on Manila hemp, and our proposal that Cuba, which is nobody's colony as yet, shall bind herself to give us a preference in her tariff for five years.

The safe return of the *Morning*, with important news from the British exploring ship *Discovery*, illustrates once more the comparative safety of Antarctic exploration, hitherto unaccompanied by such tragedies as have taken place in the north polar seas. The *Morning* left London in July of last year, and, after taking on supplies at New Zealand, entered the ice regions in December. She seems to have had comparatively little trouble in reaching the *Discovery* and then returning with the tidings of Capt. Scott's great contribution to the world's knowledge. Sir Clements Markham, the highest authority, now agrees with him in believing that the greater part of the Antarctic region consists of a vast continent, for the exploration of which ships are useless. Besides the *Discovery*, there are two other ships at work in the Antarctic regions, the *Gauss*, carrying the German expedition under Erik von Drygalski, and Dr. Otto Nordenskiöld's *Antarctica*. The British success shows what may be accomplished when such expeditions are undertaken by trained explorers and scientists.

A fortnight ago the preaching monks of France were declared outlaws by the Chamber of Deputies, and now M. Combes's proscription is complete with a refusal to authorize the Carthusians, who follow the contemplative life and manufacture a famous cordial. Many associations gather about the mountain establishment of the Grande Chartreuse. The prosperity of the order is shared by all the surrounding country; it maintains, besides its main factory, many beneficent charities; finally, it seemed clear that, unlike other aristocratic orders, the Carthusians have no political animus, and have not been perniciously active against the republic. On such and on more sentimental grounds it was hoped that the Ministry might make an exception in the case of these monks, and grant their petition for authorization. Yet, in fact, M. Combes increased his majority on the vote to deny the petition, from about fifty to ninety. The total result, to date, of his application of the Associations Law is the suppression of all monastic congregations, except a few that originally applied for authorization; and the denial of the right to teach to all the religious orders, except a portion of the female orders conducting schools for girls. Waldeck-Rousseau probably meant to hold the Associations Law as a club over two or three notoriously disloyal orders; his successor is endeavoring to make France an impossible residence for the monastic clergy.

THE REFUNDING SCHEME.

A circular has been issued by the Secretary of the Treasury for converting $100,000,000 of the 4 per cent. bonds which mature in 1907, and of the 3s of 1908, into new bonds running for thirty years at 2 per cent. interest. In a newspaper interview the Secretary explains that one great reason for taking this step is that it will provide a new lot of bonds as a basis for banknote circulation. The whole amount of bonds outstanding is not increased by this step, but the $100,000,000 thus extended will become, in one sense, permanent—that is, they will not be redeemable until 1933.

This operation was authorized by Congress three years ago. The act of March 14, 1900, reversed the fiscal policy of the Government, which had heretofore aimed at the shortest possible term of the interest-bearing debt. Anybody who examines the record of our war financiering and of the subsequent refunding operations, will perceive that both Congress and the Executive had invariably sought to keep the outstanding bonds within reach in order to redeem them and stop annual payments of interest. A conspicuous example of this policy was the refunding operation conducted by Secretary Windom in the Administration of President Garfield, when the 5 and 4½ per cents issued by Secretary Sherman under the refunding act of 1870 were about maturing. The Government did not have the money to pay them off, but the Secretary refused to extend them for any definite period. He made an arrangement with a syndicate of bankers by which he was enabled to offer the bondholders the option of being paid in cash, or having the bonds extended and made "redeemable at the pleasure of the United States," the rate of interest during the remaining years to be either 3 or 3½ per cent., according to a certain classification named. No new bonds were issued, but the old ones were stamped with the terms of the new agreement. Nearly all of these bonds were turned in by the holders and stamped in this way. Thus, when the Government had more money than it needed, it was not obliged to buy bonds in the market at a premium, or to deposit it in banks without interest. It was only necessary to call for a certain amount of bonds, and then redeem them and stop the interest.

There never was a valid reason why this plan should not have been followed through the entire term of the national debt; nor would anybody ever have conceived of a different policy but for the exigency of the national bank circulation. Nor would public opinion have tolerated any change of attitude in this regard had not other important events driven the money question out of politics. Mr. Bryan was beaten in the campaign of 1896, and the Democratic party, which had previously been very keen in criticising all financial measures, was divided, beaten, and cowed. Then the Spanish war came, and the questions relating to the acquisition of new territory superseded the old issues. Thus the Republican leaders felt that they had a free hand, and that they might deal with the bonded debt as they pleased. They did not want to keep the debt alive for the sake of the debt, but for the sake of the banks—and not for the sake of the banks *per se*, but for their note issues. They saw the penumbra of a declining circulation, and they were not prepared to deal with it in a scientific way. They did not take a favorable view of "assets currency." They thought that a solution of the currency problem might be staved off by extending the maturing bonds instead of redeeming them. Hence the refunding clause in the gold standard act of 1900. Under that act Secretary Gage refunded about $445,000,000 of 5s, 4s, and 3s maturing in 1904, 1907, and 1908 respectively, into 2s, running thirty years, and paid about $40,000,000 in premiums to the holders for the privilege of doing so. He discontinued the refunding operation on the last day of December, 1900; one of the reasons assigned for it being that the discontinuance would put the Government in better condition, either for purchase, or for payment of the remaining debt when due.

Looking at the present operation from the point of view of Government finance solely, it is quite indefensible, since it puts upon the taxpayers a burden of thirty years' interest at 2 per cent., which is 60 per cent., in place of, say, three years' interest at 4 per cent., which is 12 per cent. The 4 per cent. bonds maturing in 1907 amount to $233,000,000. If $100,000,000 of these are now refunded at 2 per cent., the interest for thirty years will be $60,000,000, as against $12,000,000 by the original plan of issue—a difference of $48,000,000 against the taxpayers, or of $46,000,000 after allowing for the 2 per cent. premium which Secretary Shaw says he will require the bondholders to pay. It is hardly necessary to say that, considered by itself, this is bad financiering, and that, apart from the national banknote question, it would be unthinkable. It is open to serious doubt, however, whether this attempt to eke out the present hidebound currency system will have the desired effect. At all events, it will not dispense Congress from the necessity of overhauling and amending that system at an early day.

FEDERAL BOARDS OF INQUIRY.

Among the recommendations of the Anthracite Strike Commission is a suggestion that the State and Federal Governments should provide machinery for the making of a compulsory investigation of difficulties similar to the one which the members were then pursuing. The object of such investigation is, of course, to obtain the facts in each case, so that public opinion may be enlightened and enabled to exercise an influence in settling the controversy. Most of the States already have some kind of apparatus for making these inquiries, but their labor commissions are generally composed of needy politicians, or of men so little known that their opinions carry no weight. In order to give any effect to an *enquête* of the kind, it must be committed to the hands of men of wide repute for intelligence, justice, and responsibility.

The first objection likely to be made to this method of dealing with strikes is the Constitutional one. What kind of labor troubles can the Federal Government deal with? The Commission refers to the "compulsory investigation of difficulties similar to the investigation which this Commission has made." This inquiry was not of a Federal or interstate character. In a secondary sense, the coal strike affected nearly all the people of the United States—that is, it curtailed their supply of one of the necessaries of life—but primarily it was a Pennsylvania affair exclusively. If the Federal Government might investigate it in such a way as to compel the attendance of witnesses, then it might do so in case of a strike among the cotton spinners at Fall River or the shoemakers of Lynn. The investigation of the anthracite coal strike was not made in pursuance of any law. There was no element of compulsion in it. Both sides came in voluntarily and agreed not only to supply the information called for, but to accept the decision of the investigators as binding upon them for three years. Of course, no objection could be raised by third parties to a commission thus called into being.

The Commission points to the act of Congress of October 1, 1888, and expresses the opinion that, with a few modifications, it might be made the basis of a law for such investigations. The purpose of the act in question is set forth in its title. It is limited to controversies and differences between railroad corporations and other common carriers engaged in interstate and Territorial transportation, and their employees. While limited to common carriers, it is certainly capable of extension, if Congress so chooses, to persons and corporations engaged in any kind of interstate or Territorial commerce. It is open to serious doubt whether it could be extended to the business of a single State.

The act of 1888 provides for two methods of procedure in cases of labor troubles of the specified kind. The first is arbitration, where both disputants agree to submit to a decision of that kind. The second is investigation, and is compulsory as against both parties to the controversy, though the finding of the Com-

missioners is merely advisory. It is to be filed in the office of the Commissioner of Labor, who is directed to send a copy of it to the Secretary of the State or Territory in which the controversy exists. Whether Congress can clothe commissioners with power to investigate local disputes and compel the parties to give testimony and show their books, is perhaps not the most important question, however. If the dispute were one of great magnitude, if it were one "affected with a public interest" in a very wide sense, like the recent coal strike, the example before us shows pretty clearly that neither party to the contest would refuse the information sought. If either should refuse, the public would conclude that its case was a bad one, that it shunned the light of day, and the popular verdict would be cast against it for that reason. We think, therefore, that the suggestion of the Commission might properly and wisely be carried into effect, even without conferring compulsory powers on the investigators.

If such a commission could have been brought into existence last June, the report says, "we believe that the coal famine might have been averted—certainly the suffering and deprivation might have been greatly mitigated." Then, an estimate is given of the losses incurred by the various parties concerned. Those of the mine owners are estimated at $46,000,000; those of the mine employees at $25,000,000; and those of the transportation companies at $28,000,000. The losses of the mine owners are probably overestimated. Although their coal was not mined and sold, it is still in the ground, and is available for future sales. Their losses are simply the amount they had to pay for expenses, interest, and depreciation during the strike. The loss to the employees, was, however, total. The wages lost to-day cannot be made good to-morrow. The losses to the transportation companies were probably as much as $28,000,000, and this sum can never be recovered. The losses to the public were great but indeterminate. They reinforce the argument of the Commission for a Federal Board to take cognizance of labor difficulties of unusual magnitude. The act of 1888 designates the President of the United States as the person who shall tender the services of the Federal Board contemplated therein. He is, therefore, the one to determine the dimensions and character of the controversy calling for such treatment.

THE IRISH LAND BILL.

One can but sympathize with the high hopes expressed, both in England and in Ireland, that the new Irish Land bill may at last heal the open sore of turmoil and discontent in that country. Yet we have seen the Irish question "settled" too many times before to indulge in over-confidence now. One vitiating element in every former apparent solution certainly remains to-day to vex the situation. We refer, of course, to the malign influence of party politics. This it was which brought to nought Mr. Gladstone's heroic labors for the peace of Ireland, in his old age; and this, it may easily prove, will confuse and baffle Secretary Wyndham and Mr. Balfour. It is the verdict of a former Prime Minister that "the Irish question has never passed into history because it has never passed out of politics."

The political shoe is, to be sure, on the other party foot to-day. If there was any truth in the charge, so often flung in Mr. Gladstone's teeth, that he never woke to the need of doing something for Ireland until he also woke to the need of winning the Irish vote in the House of Commons, it surely could be retorted with tenfold force upon the Conservatives of the present day. The Nationalists may well boast that only because they have shown themselves to hold the balance of power in Parliament have they at last won a hearing from the man whose political reputation was made by harrying them as Irish Secretary. It is unfortunately true that the historic attitude of the English people has been, as Cobbett expressed it, to say to their own rulers, "Do what you please with the Irish, so long as you don't let them trouble our ease." There has always been, too, a strange and, as it were, congenital incapacity on the part of the English to so much as understand what Irish grievances are. This was once humorously stated by Sheridan, who said that the attitude of England towards Ireland was like that of a sergeant flogging an Irish soldier. First he cut the man across the back, and then, when the fellow protested at that, struck him across the legs, crying out, "Will nothing please you?" It is such a lack of racial sympathy, leading to misunderstandings on both sides and to the failure of so many attempts at conciliation, which was doubtless in Lord Rosebery's mind when he wrote:

> "It is difficult to avoid the impression that there has been throughout the past history of England and Ireland a malignant fate waving away every auspicious chance and blighting every opportunity of beneficence as it arises."

But the Balfour Government has chosen to believe that the ailment of Ireland is mainly economic, and that the conversion of some half-million tenant farmers into peasant landowners will gradually remove the racial and political incompatibility that keeps the two nations constantly at odds. Accordingly, Mr. Wyndham, encouraged by many of the prominent Irish Nationalists, has brought in a bill for voluntary land purchase more liberal and more sweeping than any previous relief measure. Mr. Gladstone's land acts of the early seventies, the Liberal act of 1881, the Tory bill carried through by Lord Ashbourne in 1885, the land-purchase clause of Mr. Gladstone's Home Rule bill in 1886, were all based on a common principle. The State advanced cash or credit (land stock) with which the tenants paid their landlords. The money for this advance it borrowed at a low rate of interest. It repaid itself by charging the tenant a higher rate of interest for a term of years, thus providing for the regular payment of its interest charges and for the gradual extinction of the principal under the familiar workings of a sinking fund. No previous Ministry has gone beyond this principle of loan and repayment, and, subject indeed to vexatious delays in adjusting prior mortgage liens and in searching titles, the earlier land-purchase plans have slowly increased the number of small holdings in fee simple.

While our information is still too scanty to admit of any detailed criticism of the financial features of Mr. Wyndham's bill, it is patent that it differs from all earlier ones in waiving full repayment, and offering a free grant of £12,000,000 to be applied towards reducing the cost of purchase to the tenants. This grant is directly traceable to Capt. Shawe-Taylor's conference between landlords and tenants. At that informal but memorable gathering the landlords stated what they were willing to take, the tenants what they were able to offer; and, finding a considerable discrepancy between the figures, they jointly petitioned the Government to make up the difference. One may assume the good faith and the general competence of the conference, and yet find that its recommendations lacked all the qualities of a compromise or bargain. X who asks 5 and Y who bids 3, can easily strike hands if Z will supply the missing 2. This friendly rôle of Z Mr. Balfour's Government has taken upon itself, and even should Mr. Wyndham's estimates of the economies of administration to be effected indirectly by the bill prove excessive, nobody can doubt that peace at £12,000,000 is cheap at the price.

Opposition will undoubtedly fix upon the very high valuation of the land and the excessively long period of repayment—sixty-eight and one-half years—as weak features of the bill. To the old adherents of Mr. Gladstone it will seem that the Government has borne too heavily upon an important but, after all, single element in a complicated situation, for which the real remedy is home rule. On the principle of not interfering with a notable deed of charity, such doubts may be suppressed. Partisan interests, however, are likely to supply Mr. Wyndham's candidacy for the succession of Saint Patrick with the requisite number of devil's advocates; and many who applaud the boldness and the generosity with which the Govern-

ment has staked its life upon this measure, will doubt if anything short of home rule will permanently content that sturdy group of Irish Nationalists who, as Mr. Bryce once wrote admiringly, "vote as one man, though capable of speaking enough for a thousand."

Extreme caution, not to say coldness, marks the attitude of the Irish press and leaders towards the Conservatives bearing gifts. The most they will say is that Secretary Wyndham means well, and that far be it from them to reject this friendly overture from an hereditary foe; but they would like, before committing themselves in the least, to see it "put in writing," as Alice in Wonderland has it. We suspect, also, that there is more in the Irish hesitation than this natural desire to study at leisure the bewildering details of an intricate measure. It was said that only two men in Great Britain really understood Mr. Gladstone's Land Bill—himself and Timothy Healy. Time may properly be asked now to master the new bill; but we think that the Nationalists are also waiting to see what is to go along with it. Are they to get the Catholic University for Ireland which Mr. Balfour has long favored personally, and which the Royal Commission on Education approved in its recent report? Are they also to have a further extension of local government—that is, home rule under some name intended to make it smell sweeter in Tory nostrils? All these matters, and more, are thought to be lying behind the first of the Government's Irish measures; and there is certainly enough in them to give the Irish people pause.

"PARSIFAL" IN AMERICA.

It was to be expected that the announcement of Mr. Conried's intention to produce "Parsifal" in this city next winter should cause a commotion at Bayreuth, and induce Mme. Cosima Wagner to denounce the project as "irreverent and illegal." Monopolists are apt to be tenacious of their claims, and "Parsifal" is at once the most extraordinary and the most profitable monopoly the world of music has ever seen. The last and, in some respects, the most interesting work of the greatest of all opera composers, it has been a Bayreuth specialty for two decades. Large sums have been repeatedly offered for permission to produce it in other cities, but Wagner's widow has always declined them emphatically, nay, indignantly. She even objects to having the opera produced in concert or oratorio form, without scenery, costume, and action; and when, last December, an Amsterdam society brought it out in this manner, a formal protest, signed by Karl Klindworth, Hans Richter, Felix Mottl, Engelbert Humperdinck, and others, was printed in the newspapers of Germany. On the other hand, the late Anton Seidl, second to none in his reverence for Wagner, saw nothing improper in such partial performances of "Parsifal," which he gave here repeatedly; nor did this prevent Mme. Wagner from inviting him to conduct this opera at Bayreuth.

Is it desirable to perpetuate the Bayreuth monopoly of "Parsifal"? To answer this question we must inquire, "Why was it ever created?" Why was the Wagner Theatre built in the small, inaccessible Bavarian town of Bayreuth? As everybody knows, this theatre was erected, before "Parsifal" was written, for the four dramas constituting the "Ring of the Nibelung." Long and painful experience had convinced Wagner that if he was ever to teach singers and players how to interpret correctly these music-dramas, so original in style, so utterly different from what had theretofore been known as opera, it could be done only in a theatre absolutely under his own control. The German opera houses, half a century ago, were in a deplorable condition. Wagner speaks of "the almost grotesque incorrectness" of the performances given in them, and this remark applied particularly to his own operas—to "The Flying Dutchman," "Tannhäuser," and "Lohengrin." In 1852, when he had already printed his Nibelung poems, "Lohengrin" was declared, at Leipsic, to contain insuperable difficulties; "and from most of the theatres," Wagner wrote to a friend, "the same complaints come in." It was one of his consolations, during his exile in Switzerland, that he was not obliged to listen to "the wretched performances" of his operas in Germany, which, he wrote, "would probably only break my heart."

Eight years later, when he received his amnesty, he would have been glad to give the managers of the German opera houses the advantages of his personal cooperation at rehearsals; but they declined it, without thanks. "They seemed to be," as he wrote, "particularly anxious to keep me from all contact with my works." In Berlin the intendant even refused to see him. Most of the conductors were hostile, while good and willing singers were few and scattered. Under such circumstances, a theatre of his own, at some place like Bayreuth, was practically a necessity. But—and here we reach the kernel of the question—Bayreuth was originally intended merely as a means to an end. There Wagner intended personally to train singers from all parts of the empire to interpret his works correctly, so that they might be able to do justice to them subsequently in their respective opera houses. Logically, therefore, Bayreuth, having done this work, had lost its reason to exist. But Wagner was somewhat inconsistent. Having built his theatre, he planned to reserve the Nibelung operas for it alone, and it was only because of the financial deficit of the first festival (1876) that he was induced to sell the performing rights to other theatres. He still distrusted those theatres, and rightly, for they were even then little disposed to listen to his counsels. But since that time there has been a complete change of front, and the German opera houses vie with one another in their efforts to perform his operas in exact accordance with his intentions. Had they shown the same disposition thirty years ago, he would promptly and gladly have given up his Bayreuth plan, which involved an endless amount of labor, anxiety, and expense.

If he had clung to his plan of reserving the Nibelung Tetralogy for Bayreuth, what a calamity it would have been for the musical world! Within the last quarter of a century those masterworks have been enjoyed by millions who would never have been able to go to Bayreuth. Yet "Parsifal" is in that predicament. It would be a shame to keep it always in a remote place where only rich tourists can see it. It cannot be denied that Wagner expressed the wish that "Parsifal" should be reserved for Bayreuth; but he also wrote, less than a year before his death, that if only the wealthy could enjoy the festival performances they must be pronounced a failure ("zur Unfruchtbarkeit verurtheilt"). His plans concerning the distribution of free tickets are being carried out in a very limited fashion. His widow is also ignoring his wishes in other respects. Whereas his main object was that the Bayreuth theatre should serve as a model for other opera houses, she gets angry if others follow its example, and two years ago she even threatened suit against Munich for building a theatre and arranging for performances exactly *à la* Bayreuth!

One of Wagner's objects in wishing to reserve "Parsifal" for Bayreuth was, as he wrote to the King of Bavaria, to have a sure source of income for his family. But, at the present day, the income of his heirs is, apart from Bayreuth, at least $100,000 a year, so that friends and admirers need not worry if Mr. Conried does break the "Parsifal" monopoly. The number of American visitors to Bayreuth will not be greatly decreased thereby, and in most European countries "Parsifal" is protected by copyright until 1913. The Bayreuth festivals are unique in many ways and will always attract tourists. At present they are even fashionable, and Mr Conried cannot change European fashions. The only remaining question as to the desirableness and propriety of producing "Parsifal" in New York concerns the ethics of copyright. Even if Mr. Conried refused to pay the usual royalties, the case would be different from the ordinary piracy of books or music. A parallel case would be a book that hundreds of thousands were anxious to read, but that was kept in manuscript in a remote town. But

Mr. Conried is willing to pay the royalty, and more cannot be asked of him except that he should, as he doubtless will, follow the example of Bayreuth in staging Wagner's last work in such a way that its scenes will resemble paintings by the great masters.

THE SMALL PUBLISHER.

One of the more enterprising of our younger publishers, having recently allied himself with an older house, explains his action as follows:

"The tendency of modern business has convinced me that it is only a question of time when a publisher doing a limited business, with an organization necessarily small, and without the advantage of periodicals under his direction, will be unable to compete successfully with a larger house having these accessories."

If this be a correct analysis of the situation—and the speaker, Mr. R. H. Russell, had staked the prospects of an agreeable and distinctive business upon its correctness—the small publisher will soon be extinct. Certainly the publishing trade has not escaped the common lot of consolidation. At present we see massed in, say, a couple of houses the traditions of some dozen older firms. Most of the latter, according to present standards, would be called small publishers. Furthermore, the recent joint action to maintain the market prices of books is a step towards the wider consolidation of the publishing interests. It is the "gentlemen's agreement" which precedes a formal merger. As to the general tendency there is no doubt; the question is, only, Will the trade become completely centralized, and the small publisher eventually disappear?

Before giving a definite answer, it should be recalled that publishing is more and more submitting itself to what may be described as the department-store idea. Since books are various and appeal to divers classes of readers, something of this sort of organization lies in the very nature of the business. But besides the classification according to subjects of books, and besides magazine and subscription-book departments and the retail book store, certain houses are adding, with considerable success, departments of fine and limited issues or of art reproductions. Here it is that the real conflict between the small and great publisher lies. So far as merely the making of the average marketable book is concerned, the small publisher is already an anachronism. He can hardly command the capital to take the risks of widely scattered ventures, and he no longer stands in intimate relations of good will, on the one hand, to a small group of authors, and, on the other, to a select body of book-buyers. The modern publisher has in his pay a score of authors where his predecessor had one; but none to-day could show to the casual visitor to his establishment such a group of lions as frequented the offices of Tonson, Bodley, and the elder Murray. Neither public dinners, nor royalties, nor profits of a kind these antediluvian bookmakers never dreamed of, can disguise the fact that publishing has become far less personal and far more of a business. Accordingly, it would be as foolish for a small company to embark upon the routine course of bookmaking as it would be for any of us to engage in the steel business with only the facilities of our own back yards.

The small publisher must, like the small merchant generally, make good his position by offering fine, or at least distinctive, products, and thus attracting a select clientèle. There will always be people who will forego something per cent. of discount for the comfort of buying books from a carefully chosen stock and in a well-ordered shop. And there are many bookbuyers who are on the lookout for beautifully made books, and for all new works that combine with novelty a certain distinction of tone. It would be easy to instance, both in England and America, many publishers who, starting in the most modest way, have, through care in the choice and manufacture of books, made a very enviable success. And this is said not so much of the private presses, which appeals to bibliophiles in the narrower sense, but of regular publishers, in the smaller as well as in the larger cities.

We cannot believe that the great houses will ever wholly occupy these pleasanter fields of the trade, or that the more personal kind of business will, when intelligently conducted, ever lack reasonable support. It is probable, indeed, that in the long run the small publisher will gain the most desirable kind of patronage. One often forgets that the great consolidations of all kinds depend very largely upon the creation of new classes of purchasers. Do, for example, Messrs. Durand-Ruel or Mr. Macbeth lose customers because prosperous "art departments" have been added to department stores? The case of the small publisher is simply that of all businesses which prefer a distinctive product, and a small but constant and remunerative patronage, to competing in the general market.

But this is certainly true: a new and previously unexampled publishing is arising, which adopts the methods of other great manufacturing enterprises. It employs the skill of thousands of specialists and littérateurs, but it cares no more for science or literature as such than the Smelting Trust, which keeps scores of scientists in pay, cares for pure science. In either case, it is volume of business, command of capital, knowledge of markets, and aggressive administrative capacity that count. Sales and profits loom necessarily higher than niceties of production. Unquestionably, a young publisher must to-day choose one road or the other; he must either ally himself with the great bookmakers, and pursue the roads of wholesale advertising that lead to their kind of success, or he must limit his monetary ambitions and trust his own ability gradually to assemble, often to educate, a public for his finer wares. This will, we hope, continue to seem an adequate reward. In the past, before the creation of a reading proletariat, such was the regular condition of success in publishing. We think that the trade itself, and readers least of all, could ill spare the small publisher.

A SIGN OF THE TIMES.

LONDON, March 20, 1903.

The recent elections in England, especially the elections at Woolwich and at Rye, have a twofold importance, the one transitory, the other permanent. Their momentary significance lies in the evidence they afford of the waning popularity and declining strength of Mr. Balfour's Cabinet. It is easy enough to make too much of bye-elections, but it is also easy to underrate their import. The safe rule for an observer who wishes merely to ascertain the truth, is to pay no attention to the minor considerations, such as the character or adroitness of particular candidates, local circumstances, and the like. These things, of course, influence every election, and tell for more than their intrinsic worth upon bye-elections. But since these special circumstances must, from the nature of things, favor now the Government and now the Opposition, and on the average favor each pretty equally, they may be set aside. The rejection of a candidate must be counted as a substantial defeat, or his success as a substantial victory, for the party to which he belongs. Attention, extending now over twenty years, to the result of electoral contests, has convinced me that this is the safe rule, and that when a set of bye-elections tend in one direction, they afford a fair index to the trend of public opinion. Personally, I do not see how it is possible to doubt that, at the present moment, the popularity of the Ministry and of the party which the Ministers lead, is on the decline. It is, however, possible that their popularity may be renewed either by the exercise of statesmanlike skill, or by occurrences which it is now impossible to foresee. What makes this state of things the more serious for the Unionists is that the Irish Land bill will, whatever its merits or its demerits, assuredly not add to the strength of the Cabinet. The proposed Land act will certainly impose additional pecuniary liabilities on England, and this at a moment when Englishmen feel that the burden of taxation is already heavy.

Let me add, before quitting the immediate and transitory aspect of the recent elections, that no one can be sure what will be the exact result of a loss of credit on the part of the Cabinet. We must put it side by side with the prestige acquired, at any rate for the moment, by Mr. Chamberlain. He has become the most prominent member of his party; his rise to a leading position has been, if you take his whole career, slow, but it has been uniform. He has all but passed from the position of

a distinguished party leader into the position of a national statesman. This transition, or transformation, which is traceable in the life of every man who has come to the first rank in English politics, is hard to define, but easy to perceive. Men past middle life, whose memory carries them back, say, to 1848, and who, pondering over the career of Lord Palmerston, and remembering how a man who was at one time the hero in foreign politics of a certain type of English Radicals, became, in his later days, the favorite of the nation, will note points of resemblance between the political fortunes of Palmerston and of Chamberlain. From these matters, however, which, after all, refer mainly to the ups and downs of party conflicts, and, while they excite much attention for the moment, are soon absolutely forgotten, it is well to turn to the permanent importance of electoral contests which appear at first sight to be determined simply by the chances of party warfare.

How great may be the essential importance of even a single election, may be seen from a careful consideration of the victory achieved by Mr. Crooks at Woolwich. His triumph, we are told, and probably with truth, was due in part to personal qualities; he was the sort of man, it is intimated, whom the electors liked. But this explanation of Mr. Crooks's success sends us back to the question, what was there in Mr. Crooks that pleased the electors? The reasonable answer, as far as an outside critic may venture on a conjecture, is that the confidence of the artisans was gained by their being convinced that Mr. Crooks was a man of vigor and character, who would perform the part of a genuine labor candidate, and support the policy and the legislation which the large class of wage-earners are, whether rightly or not, convinced will contribute to their prosperity. Mr. Crooks apparently was returned to Parliament just because he is, to use the language of fifty years ago, a Socialist, or, to use the political slang of to-day, a Collectivist. It is very probable that he holds no cut-and-dried economical or political doctrine, but it is certain that he will support all measures by which the power and the wealth of the State are used for the supposed benefit of artisans or laborers, and which will give them comforts, in the way of high wages or of cheap houses, that wage-earners could not, they conceive, obtain without some sort of State help.

That the Woolwich election marks the increasing influence of Collectivism, and that it is the sign that English politicians may at no distant date have to take account of the power exercised by an organized labor party, is made probable by several considerations. Mr. Crooks's Unionist opponent was not the most judicious or tactful of candidates; if common report speaks the truth, he tried to gain the vote of the working classes by promises or prophecies that a Unionist Ministry would give more employment to workingmen in the dockyards and in other Government establishments than would a Liberal Government. If such hopes were really held out, a patriotic critic may, whatever his politics, feel some satisfaction at their failure to attain their end. In any case, it is noteworthy that the Socialism of Mr. Crooks seems to have been met by appeals to the class interest of artisans, and this is surely a tribute of an ominous kind to the political power of workingmen, who are influenced, if not by theories, yet by ideas, akin to Socialism.

Consider, again, the effect of a bill which, almost at the very date of the election at Woolwich, passed through the House of Commons. It is termed the Outdoor Relief (Friendly Societies) Act, 1903, and extends the Outdoor Relief Friendly Societies Act, 1894. Take both together, and they constitute a serious and even a portentous inroad upon the attempt which lies at the very foundation of the New Poor Law of 1834 to restrict within the narrowest limits the use of outdoor relief. Under the act of 1894, as extended by the bill of 1903, persons who receive relief from any friendly society as sick pay will, unless the relief received is more than five shillings a week, be absolutely entitled to retain this pension though receiving outdoor relief. There will be at once created a body of privileged persons entitled in virtue of their status to the advantages, without the burden or the discredit, of recognized pauperism. Can any one doubt that such privileged classes will soon be increased? Can any one wonder that the representative of the great Charity Organization Society and any reformer who still believes in the economical principles of 1834 should protest against an attack on principles of poor relief, the application whereof some seventy years ago saved England from ruin? There surely is reason for alarm. Note, too, that the relaxation of the rules regulating poor relief is, whether justifiable or not, merely part of a widely spread movement. On every side may be seen legislation, the intended effect of which is to provide for the class of wage earners at the expense of the State —that is, of the taxpayers—benefits which workingmen could not, it is presumed, obtain for themselves by their own exertions. Of the wisdom or the folly of this policy it is not my object to say anything at this moment. My wish is only to note its existence. It flows, in part at any rate, from the increased political influence of artisans and laborers; it is due in part to a real and honest change in the convictions or sentiment of the public. It is the sign that a distinct party which pursues more or less socialistic aims is coming to the fore.

Assume that such a party obtains parliamentary representatives enough to turn by their votes critical parliamentary divisions; then, even though the labor party be small in numbers, its very existence will, we may conjecture, produce two important results. In the first place, the existing parliamentary leaders, to whatever party they may nominally belong, will assuredly bid against one another for the labor vote. That they will pursue this course is the more certain because it will be dictated, not only by self-interest and partisanship, but also by motives of a more creditable character. A Liberal who believes that modern Toryism is leading England to destruction, or a Unionist who is convinced that Home Rule in Ireland will be a deathblow to the strength of England and to the unity of the British Empire, may well think that it is right to make some concessions to Socialism in order to avert a public calamity. In the second place, the old Liberal party, in so far as it represents the individualism of the philosophic Radicals, of the Whigs, and of the Peelites, will gradually lose such hold on the nation as it still retains. Between Liberalism of the old type and Socialism there can be no permanent alliance. AN OBSERVER.

MADAME DE STAËL AND NAPOLEON.—I.

PARIS, March 11, 1903.

Napoleon's hostility to Madame de Staël has done as much for her reputation, or more, than her works ever did. The very title of a recent book, 'Madame de Staël et Napoléon,' by M. Paul Gautier, shows that public opinion views them almost as rivals in the great struggle for glory. Though Madame de Staël's life is in hardly any part unknown, M. Gautier has found means to write a large volume on her life, using, for this purpose, the archives of the Château de Broglie, those of Coppet (the residence of Madame de Staël on Lake Geneva), the national archives, and those of the Foreign Office. The late Duc de Broglie gave him access to a large number of interesting letters addressed to Madame de Staël, among others, by Joseph Bonaparte, Chateaubriand, and Talleyrand. He was allowed to see at Coppet the inedited letters of Necker to his daughter during the period of the Consulate.

When Gen. Bonaparte arrived in Paris on the 5th of December, 1797, with the Treaty of Campo Formio, which he was to present to the Directory, he sent an aide-de-camp to Talleyrand to ask him when he could be received. Talleyrand answered at once that he would receive him the next day, and immediately advised Madame de Staël, his friend, to be at the rendezvous.

"She burned with impatience," writes M. Gautier, "to view the features of the young General-in-Chief of the Army of Italy. He came back covered with the laurels of victory; he was, at the age of twenty-eight, the first warrior of Europe; people praised his courage, his disinterestedness, his love of liberty. He liked the philosophers and the poets; Garat said of him that he was 'a philosopher at the head of armies.' He read Ossian, which pleased his dreamy nature. . . . He detested luxury, lived simply, avoided ovations, which offended his modesty. In short, he seemed like one of Plutarch's heroes who was to give to modern times an example of antique virtues."

Gen. Bonaparte's reputation had inflamed the romantic imagination of Madame de Staël; as insects are attracted by light, she was attracted by all that was new and brilliant. Of an active and restless disposition, she liked men of action, whether they were legislators, diplomats, or soldiers; she threw herself into the midst of the intrigues, the agitations, the struggles of the time, and her violent interest in public affairs took easily the form of a romantic attachment for public men. Before Bonaparte had returned to Paris and while he was in Italy, Madame de Staël wrote several letters to him, full of admiration—so it is said, at least, in the 'Memorial of St. Helena,' and confirmed by a letter written after the death of Napoleon by Gen. Bertrand to King Joseph. These letters were never published, and have probably been destroyed. Bonaparte was in love with Josephine, his wife (the only woman, in fact, for whom he ever felt a real and lasting passion), and Madame de Staël, if we may believe the 'Memorial of St. Helena,' wrote to him that "it was a monstrous thing, this union of genius with an insignificant little

Creole, incapable of appreciating him." Bourrienne, in his Memoirs (which, it must be said, are not considered a very trustworthy document) speaks of these enthusiastic letters. Bonaparte, he says, read fragments of them to him, and said laughingly: "Bourrienne, can you conceive such extravagance? This woman is mad! Just imagine, a *bel esprit*, a *faiseuse de sentiment*, comparing herself to Josephine. Bourrienne, I can't answer such letters."

At the meeting of Bonaparte with Talleyrand, the latter introduced Madame de Staël to him. "He paid little attention to her," says Talleyrand. "He had, however, an amiable word for her; told her that, on his way through Switzerland, he had called on her father Necker, and regretted not having found him." This short conversation took place in a large drawing-room, before the Minister's cabinet, filled with people anxious to see Bonaparte. A few days afterwards, Madame de Staël invited the General to a ball, but he did not go; he was instinctively afraid of the inconsiderate, imprudent character of Madame de Staël. He felt that she wished to find in him an instrument for her political aims, her ambition, the ambition of Benjamin Constant, the young Swiss who had linked his fortunes to those of Madame de Staël.

At a feast given by Talleyrand in honor of Bonaparte, Madame de Staël asked the General, in the midst of a large circle of people, who was, in his opinion, the first woman in the world, dead or living. Bonaparte answered with a smile: "The woman who has had most children." Another time Madame de Staël asked him (that was already after the 18th Brumaire), before many people, if he liked women. "Madame," answered Bonaparte, "I like my own"—upon which Madame herself exclaimed, before Lucien, "This answer was simply sublime; Epaminondas would not have answered differently." In reality, their two natures were not congenial. Madame de Staël was domineering, and Bonaparte was not the man to accept any domination. During the campaign in Egypt, distance added much to the halo with which the imagination of Madame de Staël had surrounded Bonaparte, and prevented direct contact, which had never been very happy. After Bonaparte's return, when a *coup d'état* against the Directory became imminent, Madame de Staël saw all her friends, Talleyrand, Sieyès, Daunou, Cabanis, Chénier, engaged in the plot. On the great day, the 18th Brumaire, Benjamin Constant, at Saint Cloud, sent her news from hour to hour. She soon persuaded herself that the triumph of Bonaparte was the triumph of liberty. She wrote enthusiastic letters to her father: a new era was beginning. She obtained for Benjamin Constant a place in the newly formed Tribunate.

Madame de Staël, however, was not long in perceiving that the new régime was not the era of perfect liberty which was her dream; and she entered the ranks of the opposition to the First Consul, who was assuming by degrees a dictatorial power. The Tribunate was the centre of this opposition, and Benjamin Constant was one of its most gifted members. He was one of three whom Bonaparte liked to qualify as *idéologues*. A speech made by him in the Tribunate, in which he denounced "an uneasy and boundless impatience" and the desire of the Government "to go through the examination of the Tribunate as through a foreign army," made Bonaparte very angry, and he turned his wrath against Madame de Staël as well as against Constant. From that date, all was over between the First Consul and Madame de Staël. In vain did she try to see him; he avoided her. He spoke very severely of her in his letters to his brother Joseph; he had shut his house to many of the friends of his wife Josephine; he considered scandalous the contempt shown by Madame de Staël for the common ways of the bourgeoisie, and the publicity which she gave to her relations with Benjamin Constant.

In April, 1800, Madame de Staël published a book entitled 'De la Littérature, considérée dans ses Rapports avec les Institutions Sociales.' As M. Paul Gautier justly says, every book of Madame de Staël's is an act. The volume, written apparently as a philosophical defence of the doctrine of human perfectibility, was, if you look beneath its phraseology, a protest against the First Consul made in the name of the Revolution. Bonaparte had not yet fought the battle of Marengo; he remained silent, but his hostility to Madame de Staël became deeper.

When Bonaparte was on his way to Italy, Madame de Staël's sentiments may be guessed from what she wrote afterwards: "The good of France required that she should suffer at that moment some reverses." However, when Bonaparte comes back, after Marengo, she writes to Madame Récamier: "This man has a will which uplifts the world." She soon saw Bonaparte acclaimed, almost deified; the hero became a peacemaker, and made the treaty of Lunéville. In reality, she had never ceased to feel great enthusiasm for him, and could not console herself for his indifference to her. She says to Lucien, almost with tears: "I become stupid before your brother, so much do I desire to please him. . . . I want to force him to occupy himself with me." Bonaparte, to whom Lucien reports these words, laughs, and says: "I see:

'Son génie étonné tremble devant le mien.' "

The year 1801 was, for Madame de Staël, a series of festivals and amusements. She stayed some time in Switzerland with her father, described to him the dangers which threatened liberty in France, and induced him to write his "latest views of politics and finance." Napoleon made peace with England in October, 1801, and his popularity was for a time as great in England as it was in France. In January, 1802, he eliminated from the Tribunate twenty members who made opposition to him, among them Benjamin Constant. Madame de Staël began against him an open war of epigrams. Bonaparte sent her some advice by Talleyrand, by his brothers Lucien and Joseph: "Tell this woman, Her Illustration, that I am neither a Louis XVI., nor a Larévellière-Lépeaux, nor a Barras. Tell her not to stand in my way, wherever I want to go; otherwise, *je la briserai*." He added: "I will never do her any harm needlessly."

Three weeks after the signing of the Peace of Amiens, on Easter Day, April 18, 1802, Paris heard the news of the Concordat signed between France and the Pope. Madame de Staël was greatly incensed at the official reconciliation of France with the Papacy. She shut her windows while Bonaparte went in great state to Notre Dame amid the acclamations of the people. She speaks, in her 'Considerations on the French Revolution,' of the "ancient coaches of the monarchy used on that day, the same coachmen, the same footmen," of the army of the Republic forming the escort; and she recalls the words of Milton: "We are to become the opprobrium of free nations." Madame de Staël was not an enemy of religion, but during the Directory she had hoped to establish Protestantism as the State religion. She was a good Calvinist. She told the republicans that "Protestantism was the only means of destroying the influence of the Catholic religion, and that, as a state religion, it would inherit the influence possessed by Catholicism."

Correspondence.

THE CERTIFICATE SYSTEM.

To the Editor of The Nation:

Sir: As Regent of Radcliffe College, I was often asked to permit candidates to enter on certificate. It is unnecessary to say that it was impossible to do this, because Harvard College does not admit on certificate. To the question why a candidate wished to enter on certificate, the usual reply was, "Because it is easier"—a reason that I could easily show was unworthy of a really earnest student.

I once asked a teacher of high rank about two boys who had been sent to college by his institution, second to none in America. "John took examination and entered with credit," he said. He went to a college that recognized no certificates. "Will—well, he was the sort of a boy that you could give a certificate to, and we sent him to —— College"—one that receives without examination.

"If they do these things in the green tree, what shall be done in the dry?"

Arthur Gilman.

Cambridge, Mass., March 27, 1903.

THE PROS AND CONS OF CO-EDUCATION.

To the Editor of The Nation:

Sir: Owing to the action of Chicago University, there has arisen in the last few months a lively discussion of the problem of co-education. Such a discussion naturally calls forth the opinions of persons who at least know what they think. I fancy, however, that there are many vitally interested in educational matters who, like myself, do not know what they think about this important subject.

Nevertheless, I have had many opportunities to observe and form opinions. My undergraduate course was taken in a co-educational college. My graduate studies were carried on in Europe. I have taught for twenty years; ten of these years were spent in three different co-educational institutions, ten in a college for men only. This college has, however, an annex after the manner of Barnard, in which I have usually taught one class. Further, I have had a consuming interest in the subject ever since my own years as an undergraduate, have observed much and read much, and have asked countless questions of others about this theme. Now, after more than twenty years of experience, observa-

tion, and reflection, I should be delighted if I were only in the position of those who know so decidedly what they think.

As it is, I am "on the fence." I climbed up there when I was professor at one of the best known co-educational colleges in the whole country. My transfer to a college for men did not enable me to get down on either side, and I am still "on the fence" because I believe the problem incapable of complete and final solution in this generation.

We must draw a strict line of demarcation between the common schools (including private of the same grade) and secondary schools on the one side and the college on the other. The arguments for or against co-education in the one kind of school have no validity applied to the other. The fundamental difference is that in the lower and secondary schools the pupil is still under the direct care and charge of his parents. Home life and discipline are still the main factors in his life. Even in the last years of the grammar grades and the whole of the high school, where the problem of sex begins to play a rôle with the coming of adolescence, the situation is not essentially altered. In the college, however, the whole state of affairs changes. Home life and discipline are only memories. Except in grosser breaches of decorum, where the state or the college steps in to punish, the student is left for the practical conduct of life to the guidance of his own judgment and conscience, though aided, it is true, to a greater or less extent, by the influence of the church and the conventions of society. In the co-educational question as applied to the college, therefore, the problem of sex is all important. It goes without saying that my uncertainty applies only to collegiate co-education.

Now, while I am "on the fence" as regards the whole question, there are certain things which I do know as the result of these years of observation.

In the first place, the charge that co-education means greater moral risk for the young women is arrant nonsense. Cases of moral lapse doubtless occur in co-educational colleges, but so they do among young people from the same classes of society who do not go to college, and relatively far more frequently. It isn't the co-educational girl who is given to doing risky things. It is true that the college is occasionally obliged to administer quietly severe discipline, even expulsion; but personally I never aided in the administration of discipline in a case where there was evidence of any actual moral delinquency, although such cases are said to arise at long intervals. Man is usually the tempter and woman the sufferer in all affairs of this kind. Society lets the man go scot free and punishes the woman. The co-educational college, for the protection of the girls, must punish where society would hardly begin to gossip, but it is also juster in that it punishes both sexes alike.

On the other hand, the alleged improvement in the manners and morals of the boys in the co-educational college is equally mythical. It is an argument based upon the supposed refined and gentle influence of the fair sex, of which we have heard much from the days of chivalry on. It was a sham then, and is a sham now.

Another wholly groundless charge is the early and improvident co-educational marriage. Here again the contrary is rather true, if comparison be made with marriages in ordinary life. Co-education means considerable acquaintance with the faults and failings of the other sex, and that does not of itself accelerate marriage.

Equally groundless is the statement that the co-educational college spoils the manners of the girls, making them coarse, mannish, and boisterous, while the separate college for women refines and polishes. On this latter point I shall have something to say farther on. Before you can pass judgment upon the manners of the students of the co-educational college, you must first observe the homes and communities from which they come. This is the only fair test. That is, you must compare the co-educational girl, or, for that matter, the finishing-school girl, not with some ideal and perhaps impossible standard, but with the other girls from the same classes of society and the same communities who remain at home. Having done that, no fair-minded person who uses his own eyes and ears can fail to acquit the co-educational college of the charge.

The attendance of young women does not lower the scholarly tone of the college. My own experience goes to show that the average young woman does the work in most subjects of the college curriculum rather better than the average young man. Other teachers have made the same statement to me. As the college, whether co-educational or not, really conducts its undergraduate work on the plane of the average, or less than average, student, it follows that the girls rather tend to force up the average work of a class. This is true, at least, in such subjects as language, history, etc. In certain of the sciences which seem not to appeal to the feminine mind, a contrary statement is possibly true. And here comes one of the paradoxes: I have never had a mixed class in which the most capable member was not a young man. It will be observed that I am speaking of the scholarship of the undergraduate college, not of more advanced study. In the latter, the world over, the presence of woman is so recent that the data are wholly insufficient for proper judgment.

As my foregoing *ex-cathedra* statements, with the exception of one, all confirm the stock argument of the co-educationalist, it may seem strange that I am "on the fence." The mere fact that the manners and morals of the boys are not helped by co-education is certainly no argument against it. If neither boys nor girls are hurt by co-education, why not educate them together? And then I fall back on my three negatives.

In the first place, co-education requires machinery for the proper control of the two sexes. The larger the proportion of girls, the more is machinery necessary. It is probable that increased restrictions will be demanded by public sentiment as our civilization grows more complicated and artificial. In some co-educational institutions, perhaps the most successful, the creak of the machinery is already pretty loud. Is it worth while?

And then the second query. Is the relation of man and woman in the co-educational college a natural one? There is nothing like it in after life. Nowhere else do men and women associate with so many of the other sex with anything like so much of sexless equality, competition, or comradeship, if you will. And if it is a relation that exists neither before nor afterwards, is it natural and wise?

The last consideration is the "eternal-feminine." I do not mean thereby that woman, as prospective wife and mother, needs definite training in certain lines which do not concern man. That may be true and nevertheless affect in nowise the problem of co-education. There are, however, two phases of the "eternal-feminine" which certainly do concern the problem. In the first place, the presence of woman in the class room may very seriously hamper the teacher. In many departments there are important subjects which cannot be discussed in a mixed class. Literature and history, to mention no more of the departments of study which particularly appeal to women, are full of them. This is, of course, only a minor consideration. The other phase is more serious, or less, as you take it. Are men and women so alike that they need the same education? Is the intellect sexless? Is there no essential difference between man and woman save that the one begets and the other bears children?

And now for the comment about wholly separate colleges for women. This talk of girls being brought to the heights of gentleness and good breeding by women teachers who are the flower of their kind sounds very nice, but it has one practical difficulty: at present those gifted teachers are not to be had in sufficient numbers. Everybody who has had experience in the matter knows how difficult it is to find women teachers with adequate intellectual training who are not more or less caricatures of their sex. Time will, of course, remedy the difficulty, if the separate college is to become an increasingly large factor; but at present the average woman teacher of collegiate rank is much farther from being a woman among women than her male colleague from being a man among men.

Undoubtedly co-education has done and is doing a great and needed work. The same statement is true of separate education. Is it not the part of wisdom to cease to be dogmatic about either, to recognize the fact that there are elements in the problem which are not yet worked out, and to let the future settle what belongs to the future?

R. O.

FOREIGN STUDENTS IN ITALY.

To the Editor of The Nation:

Sir: It may be of interest to many of your readers who are likely to travel and study in Italy, to have attention called to the fact that new and much stricter regulations are now in force in this kingdom regarding the granting of *permessi* for free admission to museums, picture galleries, and other national institutions and monuments. Students and professors in the various foreign archæological and art schools established in Italy can still secure such *permessi* upon application by the heads of the respective schools; but other foreign artists or professors of archæology, history, literature, or art must present to the Ministry of Public Instruction, with a formal request for the *permesso*, some "academic document" to prove their status; and furthermore this document must have affixed the *visé* of the Italian diplomatic representative, or of some Italian consul in the country of which the applicant is a

citizen, or else must be certified by the diplomatic representative of that country at the court of Italy. But students of the history or criticism of art (presumably archæology is included) may submit in place of this certified "academic document" a copy of some article on the subject that they have published. Students of foreign universities must present a document showing that they are duly enrolled as students of their respective universities during the (presumably calendar) year in which they make application for the *permesso*, and this document must be certified in one of the ways just mentioned.

All applications for *permessi* available for the whole of Italy must be made to the Ministry of Public Instruction at Rome upon official stamped paper *(carta bollata)* at one lira and twenty centesimi the sheet. This can be bought in Italy at post-offices and at shops for stationery or tobacco. With the application must be sent an unmounted photograph of the applicant not more than five by eight centimetres (two by three and one-eighth inches) in size. But if the *permesso* desired is for only one particular city, the application may be made to the head of one of the local institutions on stamped paper of sixty centesimi per sheet, and unless the *permesso* is to be valid for more than a month the application need not be accompanied by a photograph.

These somewhat troublesome regulations have now taken the place of the very liberal provisions that have been in force since 1885. E. T. M.

Pompeii, March 7, 1903.

THE GERMANIC MUSEUM.

To the Editor of The Nation:

Sir: According to the *New-Yorker Staats-Zeitung* of March 24, present, Prof. Kuno Francke of Harvard, in telling the German Society of Columbia University, the evening before, about the Germanic Museum at Cambridge, Massachusetts, while admitting the advantage it would have had in New York as its residence, because it would there reach a larger public, found this profit in Cambridge:

"Cambridge was the capital of Puritanism. The Germanic Museum at Cambridge would be the sentry-box for the outposts in the war against that Puritanism. The making a citadel of this sentry-box would depend on the coöperation of all friends of historic Germanism, German industrial activity, and German art."

Will Professor Francke allow me to venture upon the liberty of asking him to define in the columns of the *Nation* this present-day Puritanism, centring in Cambridge, which he wishes to see exterminated? The question is asked not out of loyalty to Puritanism (I was born and bred in the South), but out of lively curiosity.

A. D. Savage.

New York, March 24, 1903.

To the Editor of The Nation:

Sir: I am very much indebted to Mr. Savage for having called my attention to the unfortunate distortion, by a reporter of the *Staats-Zeitung*, of certain remarks made by me before a Columbia audience. It is true that I called our Germanic Museum a sentry-box, and that I expressed the hope of seeing it develop into a citadel. But it never occurred to me that this figure of speech could be misunderstood as implying so absurd a thing as aggression against Puritanism. What I meant to express by that metaphor was that the local surroundings of this museum, its separation from a large German-speaking community, its intimate connection with a university of distinctively Puritan inheritances, could not help giving added emphasis to the mission which, in my opinion, this museum has to perform—the mission of uniting Americans of English and of German stock in the cultivation of their common Germanic traditions, and in the warfare, not against Puritanism, but against racial misunderstandings. Kuno Francke.

Cambridge, March 26, 1903.

DR. MARTINEAU'S AMERICAN CORRESPONDENCE.

To the Editor of The Nation:

Sir: In your review of Drummond's 'Martineau,' the reviewer says that "we should have had here his [Martineau's] letters to Dr. Furness and Dr. J. H. Allen." It may interest your readers to know that all of Dr. Martineau's letters to Dr. Allen, which he had preserved, were communicated by me to the Colonial Society of Massachusetts, and will appear in the forthcoming volume of the Society's Transactions, which is in the hands of the indexer. The correspondence ranges in date from 1853 to 1897, and includes some interesting letters, written during the civil war, which reflect the opinions of a large and intelligent class of Englishmen.

Henry H. Edes.

Boston, March 27, 1903.

ORANGE EATING.

To the Editor of The Nation:

Sir: Many years ago our Minister to Paraguay and Uruguay taught me the right way to eat an orange—the way they do it in South America. You pare it, except a bit at the two poles, you cut it in two in the diameter, and then (first adding sugar if you like) you eat the two cups thus formed, or a good part of them. It is the only way to get the full flavor and the delicious coolness of the fruit at its best. To eat an orange with a silver spoon is most unscientific: silver is a good conductor of heat, and the modicum of juice that is thus obtained has been rendered nauseatingly warm, and also lacks taste on account of its small amount. I have been waiting impatiently to see the South American fashion become the common one in this country, and now that it has been described in the *Nation* (or what is practically the same thing) by Professor Lanman, in the course of his interesting letter from Jamaica, I have good hope that the custom will spread. C. L. F.

Notes.

"The gratitude of Orientals" is a quality handsomely illustrated, on its positive side, towards Americans who have been pioneers of education in China and Japan. The Japanese friends and former pupils of the late Mr. Edward H. House, the unselfish champion of the rights of Japan before the world, for many years a teacher of English literature in Tokio, who organized the first orchestra and gave the first orchestral concerts in Japan, propose to rear some memorial to commemorate his work and personality. A House Memorial Lectureship in English Literature and Music is to be established in order to promote the study and appreciation of these subjects in Japan. The funds will be under the direction of the Imperial University, or, if large enough, be divided with the Academy of Music in Tokio. Literary men or musicians living in Japan or visiting the country may thus be induced to give lectures or concerts from time to time. Some of the men prominent in public life, formerly pupils of Mr. House, have already made subscriptions, but the list is open to all his friends, as to all who favor the enterprise. Professor N. Kojima of the First High School (Koto Grakko), or Dr. K. Mitsukuri of the Imperial University, both of Tokio, will receive subscriptions.

Charles Scribner's Sons are about issuing (in connection with Duckworth & Co., London) 'Michael Angelo Buonarroti,' by Charles Holroyd, keeper of the National Gallery of British Art; and 'Middle-Aged Love Stories,' by Josephine Dodge Daskam.

Frederick A. Stokes Co. have in press Bismarck's correspondence with the Emperor William I., and 'Ordered to China,' private letters from the late Wilbur J. Chamberlin, the New York *Sun's* correspondent during the Boxer troubles.

'Wreaths of Song,' announced by the Abbey Press, is from the pen of the Rev. T. J. O'Mahony, D.D., All Hallows College, Dublin, a nephew of Father Prout.

We hardly knew what to expect of Professor Royce's introduction to Fiske's Cosmic Philosophy in the new four-volume edition (Houghton, Mifflin & Co.), for surely if anything is foreign to Royce's thought, it is Fiske's. It proves to be, without exception, the best introduction to a nineteenth-century philosophy that we have seen. In skill, the comment is a good match to the text. It renders Fiske's work much more useful than it has been, by pointing out just what there is in it and where its originality comes in. It fills about a hundred and fifty pages easily read, easily referred to. As compared to Spencer's own encyclopædic instrument of torture, Fiske's lively treatise always had a vast advantage as a way of making acquaintance with the fundamental philosophical doctrines of the evolutionary pioneer; and this advantage is now increased by the attractiveness of the new edition, which we were almost tempted to pronounce the most pleasing dress in which any American book of philosophy has ever been arrayed. That, however, would be forbidden, if by nothing else, by one volume from the same Riverside Press: we mean the elder James's 'Substance and Shadow'—a book not to be forgotten on any account.

We have received through Charles Scribner's Sons 'Volcanic Studies in Many Lands,' by Tempest Anderson, an investigator well known by his researches in volcanic phenomena, especially in the Neapolitan field, and latterly appointed one of the representatives of the Royal Society of London to report upon the eruptions of La Soufrière and Mont Pelée. Mr. Anderson's work, as heretofore, is mainly of a photographic

nature, and consists primarily of a large number of photographic reproductions—hardly up to the best standard of process-work—of more or less interesting phases of volcanic activity which were personally observed, and whose characteristics were noted. In so far, the collection is an interesting one, and will doubtless be frequently consulted for reference. The text is brief, and hardly more than explanatory of the plates. The observations or illustrated studies, with many of which geologists have long been familiar, range from the Mediterranean region through the Auvergne, Canary Islands, Iceland, Germany, and Ireland to Arizona and the Yellowstone National Park. Some interesting views of the recent eruptions in St. Vincent and Martinique are added. The volume is handsomely got up.

It is difficult to realize how even the necessities of an "Expansion of the Republic" series should have warranted the publication of so garbled, half-baked, and thoroughly unsatisfactory a piece of work as Van Middeldyk's 'History of Puerto Rico' (Appletons). The editorial commendation given it by Dr. Brumbaugh, than whom no one is better qualified to speak, is intelligible (though not pardonable) upon the theory that a sincere friend of the island may have thought any book on Porto Rico better than no book at all. Judged by any less relative standard, the volume is a wasteful, irritating piece of bookmaking. A full translation of Fra Inigo would have served a far more useful purpose, even though we should have lacked the "new arms of Puerto Rico" of the titlepage woodcut, and the stale San Juan shop photographs that serve as illustrations of the present work.

In her 'Survey of Russian Literature, with Selections' (The Chautauqua Press), Miss Isabel F. Hapgood aims to give an epitome of the views of Russian critics on the history of their literature. (In the later pages, for instance, we note the influence of Skabitchevsky.) By this method she has produced a manual which will be more useful to the general reader than Waliszewski's more individual and more whimsical volume. Miss Hapgood seems nearly always accurate in her statements of fact. She has also observed a good proportion, although a fuller statement of Russian social conditions would not have swelled unduly the size of the volume. Her selections are in general well chosen; those from Turgeneff and Tolstoy, however, may be thought superfluous, and not to be preferred to more thorough criticism of the two men. Exception may also be taken to the interesting personal reminiscences which appear in the later chapters, as out of place in a work of this character. The book may be commended to all who wish to form some general idea of the development of Russian literature, and will serve as an introduction to Professor Wiener's more elaborate 'Anthology,' of which the second volume, just published, now demands attention.

Mr. E. T. Cook's 'A Popular Handbook to the Greek and Roman Antiquities in the British Museum' (Macmillan) is, thanks to India paper, of a size for the pocket, and, with a flexible leather cover, friendly to the hand. The author finds space for extracts from what critics have said about the more famous pieces, and in the articles on vases, engraved gems, and figurines, for example, gives sufficient information as to technical processes—an important matter usually slurred by ciceroni. The compilation gives an impression of thoroughness, and we believe the book can confidently be commended to visitors of the foremost museum of classical antiquities.

M. Bolot spent his whole life in the French army, in the commissary department. He saw many things which he thought to be wrong, and about which he could say nothing because he belonged to "La Grande Muette." Now he is retired, and he unbosoms himself in a work full of bitterness and rancor, 'La Grande Muette' (Paris: Ernest Flammarion). He explains how the war of 1870 could have been won if he had managed things; he expatiates on the many blunders of the General Staff, on the lavish expenditures for useless fortifications, on the vices of mobilization, the waste of money in the commissary department, etc., etc. The book, written in a loose and rather common style, contains, no doubt, some useful criticisms, but they are expressed in such a spirit as to lose much of their force in the mind of the impartial reader.

Victor Bérard, whose work on 'England and Imperialism' was so successful, has republished, under the title 'Questions Extérieures (1901-1902)', his papers contributed to the *Revue de Paris* from month to month (Paris: Armand Colin). The main difficulty with the book is, that the rush of events has already in a few months deprived most of the subjects of their immediate interest. But, for foreign readers, there are other difficulties. Frenchmen seldom know much of what is going on in other countries, and to this rule even the majority of those who write about foreign affairs for the press are no exception. We should put M. Bérard down as one of the exceptions, but one of the exceptions who have gone to the opposite extreme: he knows too much. This is almost as great a fault as knowing too little, and leads M. Bérard to conclusions and generalizations that are often startling, *e. g.*, that Australia is a community "de mains blanches, de spéculateurs, et de nobles fainéants." And is it true that the English radicals, or any one else, have taught us that the world "belongs only" to the "mains noires"? A curious instance of excessive intelligence is when M. Bérard reaches the conclusion, from the *silence* on the subject of the terms of the Anglo-Boer peace, that there exists a secret article making England proprietor or "surintendant" of the Rand mines. The author's speculations about foreign affairs are always readable, but the field in which he works is full of pitfalls.

German-American Annals, the successor of *Americana Germanica*, offers in the March number an interesting article which is to form part of the proposed Ethnographical Survey of America. Prof. G. D. Leutscher tabulates very minutely the industries of York and Lancaster Counties, Pennsylvania, immediately after the formation of the United States. The most important general result of this investigation is the proof that the census of 1810, which has usually been the basis of economic statistics for this period, is hopelessly inaccurate. A comparison of its figures with those drawn from the assessors' books of these two counties brings out startling discrepancies, and shows the need of consulting the county and city records. This investigation is a promising earnest for the ethnographical survey of the State of Pennsylvania for which the German-American Historical Society properly hopes to enlist legislative aid. An old German midwife's record is of some genealogical importance for those who can read its orthography aright. It is summarized with business-like succinctness in a yearly tally, thus:

1801—23 buben
23 med. [mädchen] } 46

"Why Museum of *Comparative* Zoölogy?" the late Asa Gray used to ask; "why not simply Zoölogy?" In this sense, Benedetto Croce discusses the title of Messrs. Woodberry, Fletcher and Spingarn's new *Journal of Comparative Literature* in the first number of his *La Critica* (Naples; New York: Lemcke & Buechner). The article is but one example of many in this number from the same hand, which combine clear thinking with the most agreeable reading, conspicuously the opening paper of a series of "Notes on Italian Literature in the Second Half of the Nineteenth Century," with Carducci for its theme, which we have already signalized. We remark in a footnote to Giovanni Gentile's elaborate review of Varisco's 'Scienza e Opinioni' that warning is given of this journal's intention to make a definitive choice between the two allowable spellings, Aristotile and Aristotele, in favor of the former as representing the elder and secular Italian usage.

In the *Theologische Literaturzeitung*, No. 2, Professor Harnack, of Berlin, publishes some new data on an old vexed question which go to prove that Peter was actually in Rome at one time. It is a quotation from the writings of Macarius Magnes, in which this writer defends Christianity against gentile critics, especially the philosopher Porphyry, the passage reading ('Apocritica,' III. 22), "It is really surprising that Jesus entrusted the keys of the kingdom of heaven to such a man as Peter, and that he could say to him, 'Feed my lambs!' And yet it is reported that Peter, after he had fed the lambs for only a few months (in Rome), was crucified." Harnack declares that this passage agrees with the conclusions of fair historical research, which admits that Peter did live in Rome, but that the story of a stay of twenty-five years is legendary.

The political degeneracy of Austria is accompanied by a retrogression of its universities that has reached the acute stage. Only recently the Academic Senate of the time-honored University of Vienna addressed an official appeal to the Government and to the two houses of Parliament, asking for assistance to avert the threatened decay of the higher institutions of learning in the empire. This singular document says: "Austria is losing its importance in the world of scholarship, and, as a consequence, the glory and the influence of the Austrian universities are threatened." The *Neue Freie Presse*, the most influential paper in Vienna, echoes this complaint, and declares that "the condition of affairs cannot be painted in too sombre colors." The trouble seems largely to be a matter of money, funds being lacking to keep the universities up to the demands of the time, especially in the case of laboratories, clinics, etc. Again, it seems impossible, on account of the small salaries paid, to keep a good man in an Austrian

university; as a rule he is promptly called to some German university, and just as promptly accepts. The memorial to the Vienna Senate emphasizes the fact that things have gone from bad to worse since, by the law of 1898, the professors were deprived of lecture fees.

Dr. Sven Hedin's account of his three years' explorations in Central Asia occupies the principal place in the *Geographical Journal* for March. He tells in a frank and entertaining way of his experiences in his boat-ride of 1,300 miles down the Tarim, in his journey across the desert in the dead of winter, and in his unsuccessful attempt to reach Lhasa. Notwithstanding he sought to disguise himself as a genuine Mongol by shaving his head and smearing his face with grease, he was discovered and turned back by an armed force when within about 150 miles of the sacred city. His principal geographical achievement has been, by his careful levelling in the Lob-nor desert, to throw new light on the changes which have been going on in the basin of this great Central Asian lake. His discovery of Chinese manuscripts of the second and third centuries A. D., many of them apparently receipts for corn, in a buried town on its border, opens a new chapter in Chinese history. The geographical effects of the recent volcanic eruptions in St. Vincent and Martinique are described by Dr. T. Anderson, whose work is mentioned above.

In Mr. Cutter's latest Librarian's report to the trustees of the Forbes Library, Northampton, Mass., along with other statistics showing the remarkable circulation of books in that college town, he notes that "over 2 per cent. of the inhabitants take out music scores." Smith College, for the first time, we believe, appears as a donor of money to the Forbes Library in acknowledgment of its indispensable serviceableness to the students. Yet, curiously enough, in one direction, "though the college has special art and music departments," corresponding sections of the Forbes Library "are little used by the students; their large circulation is almost entirely among the citizens."

The Justin Winsor prize of $100 offered by the American Historical Association for the encouragement of historical research will be awarded for the current year to the best unpublished monograph in the field of American history. It must be in the hands of the Committee of Award on or before October 1. Conditions may be learned by addressing the acting chairman of the committee, Prof. Charles H. Hull, Cornell University, Ithaca, N. Y. No woman has yet obtained this prize, though two have received honorable mention.

—The article of commanding interest in the April *Scribner's* is the description of the working of the Treasury Department, written by Frank A. Vanderlip, formerly Assistant Secretary of the Treasury. It was hardly necessary, however, that Mr. Vanderlip should mar a valuable paper with a flimsy attack upon the merit system for alleged failure to secure a highly competent working staff. He really answers his own assault by his almost unbounded eulogy of the Treasury Department as a working financial and commercial institution. It is too late in the day of civil-service reform to allege that the applicants for examination are largely incompetents, unable to make a place for themselves in the ordinary world of business. The point of absurdity is wellnigh reached when we are gravely told it is not politics, but sympathy and charity, that moves the average Congressman to visit the departments and plead for places. "In nine cases out of ten their requests may be debited to pure kindheartedness rather than to political machinations." When further told that the best-known political leaders are not likely to make requests that ought not to be granted, and are quick to appreciate good reasons why they may not have what they want, we instinctively think of the Platts and Quays and Gormans of the past twenty-five years, and wonder if Mr. Vanderlip has ever heard of them. But then Mr. Vanderlip himself, in another paragraph, informs us that, notwithstanding the recommendations of various Secretaries of the Treasury, Congress has persistently refused to abolish useless customs districts, twelve of them yielding only $275.26 in a single year, and one yielding but 20 cents and costing $1,800, merely "to give the Senator or Congressman most concerned an opportunity to recommend a Presidential appointment." Clarence Cary describes, with illustrations from photographs, the city of Dalny, which has so rapidly sprung into existence at the fiat of the Emperor of Russia, to provide terminal facilities for the great Trans-Siberian Railway system.

—The April *Century* opens with a detailed exposition of the restoration of the White House, at Washington, by the Clerk of the Senate Committee on the District of Columbia, Charles Moore. It is a rare piece of national good fortune that, thanks to Mr. McKim's reverence, the structure escaped the peril of losing its architectural identity under the plans for "improvement" proposed during the Harrison Administration. Ray Stannard Baker focalizes his study of the Great Northwest upon Butte City, a frontier mining camp of fifty thousand inhabitants, which produces each year more than a million dollars' worth of mineral wealth for each thousand of its population, and is too busy mining and smelting even to print illustrated circulars. The late Director of the Census contributes an interesting study of the methods of census-taking, as they have developed in our own practice. He is not happy, however, in referring to our census as "a decennial snapshot of the nation." The German census might fairly be so described, but our own authorities have gone rather to the extreme in their preference for the time exposure. Commander J. D. J. Kelley of the navy writes of the great Steamship Combine. His attitude is distinctly favorable, on the ground of the various economies which combination makes possible, more rational dates and intervals of sailing, etc. His arguments as to the impossibility of monopoly in the ocean trade lead one to wish for a good working definition of monopoly for use in such discussions. As the "monopoly" known to the strait-laced etymologist is always proved to be an impossibility, and as something really exists which the masses persist in calling monopoly, some practical understanding seems necessary to rational progress in debate.

—Mr. Thomas Willing Balch, whose contributions to the literature of the Alaskan boundary question our readers will remember, has published, through Allan, Lane & Scott, Philadelphia, a thin but handsome volume entitled 'The Alaska Frontier.' The object of this monograph is to state clearly and briefly the facts which entitle the United States to their unbroken strip of coast line between Mt. St. Elias and Portland Canal in southeastern Alaska. The fluctuating and nebulous claims which Canada has made from time to time have never been supported by any serious or tangible proof, and, perhaps for this very reason, have cultivated a Canadian public opinion which is not the less to be reckoned with because it has no sound foundation. It is on all accounts most desirable that a clear statement, divested of technicality, should be available for those interested in the controversy and who have been led into a state of uncertainty by Canadian quibblers. Except for her desire to reach tidewater on her own territory, it is doubtful whether Canada would ever have taken up the speculative theories raised by private essayists. It should be understood that there are two questions involved in the dispute. The first is, whether the *lisière* to which the United States is entitled by the treaty of 1825 is an unbroken strip, including all the marine coast line, or not. The second is as to the manner in which the boundary shall run if our rights to an unbroken *lisière* are acknowledged. The first is the essential point; the second, relatively unimportant. It is important that the agents of the United States, in representing our case before the Commission, should avoid confusing them. The obvious Canadian policy is to mix them together, and to reckon on the main point being lost sight of in the mass of verbiage which may be brought to bear on the secondary question.

—Mr. Balch gives a clear and sufficient account of the negotiations leading to the treaty, an official copy in French and English of the instrument itself, and a convincing argument from its provisions as to the continuity of the *lisière*. To this is added a wealth of illustration by photographic reproduction of twenty-eight important maps, from the earliest times to 1900, showing the uniform view taken on this point by officials and geographers of Russia, Great Britain, and Canada; thus establishing by prescription the rights near the southern boundary which have been called in question by critics, through some vagueness in the definition by the treaty of the line near Dixon Entrance. It is understood that an enormous mass of testimony has been gathered by the State Department bearing on the questions of occupation and jurisdiction. This is precisely the sort of thing which leads to unending and inconclusive argument. If the main question is correctly decided, the rest follows in its train, for the most part without argument. In Mr. Balch's book, the main threads of evidence are woven into a conclusive whole, which should be in the hands of all interested, and the publication of which is of general importance at the present time.

—"Certain Aboriginal Remains of the Northwest Florida Coast," Part II., by Clarence B. Moore, forms the latest number of the Journal of the Academy of Natural Sciences of Philadelphia. It describes the results of the exploration of nearly sev-

enty mounds along the shores of St. Andrew's, St. Joseph's, Apalachicola, Ocklockonee, Apalachee, and Deadman's Bays, St. Andrew's, St. Vincent's, and St. George's Sounds, Alligator Harbor, and the rivers and Gulf Coast to Cedar Keys. As during the previous investigation, the work resolved itself into a study of the aboriginal earthenware of the district visited. It was noted during progress eastward that the influence of Alabama and the middle Mississippi district as to the composition of ware gradually disappeared, no admixture of shell having been found east of Choctawhatchee Bay, the limit of the polished, black ware of Mississippi. On the other hand, the influence of Georgia, as shown in the complicated stamp decoration, became noticeable. In material and decoration the ware is superior, as a rule, to that of such mounds of peninsular Florida as contain earthenware, although it does not excel a few of the best specimens found in the mounds of the St. John's River. A dark vessel from near the mouth of that stream, sherds of excellent paste and superior decoration from near Dunn's Creek, and part of a vessel beautifully incised and showing the yellow of the paste alternating with the crimson pigment, from a mound near Lake Monroe, are described as fully equal to the finest earthenware of the northwest coast of Florida. It is surmised that the aborigines of the peninsula possessed fine ware, but did not, as a rule, inter it with their dead, and that their best vessels were importations, probably got through barter. Specimens of mortuary vessels, of flimsy material and fantastic form, the bases of which had been perforated previous to the baking of the clay, were found in increasing numbers. Individual vessels were often much larger than any met with on the coast to the westward or in peninsular Florida. Vessels of a new type were discovered in the neighborhood of St. Andrew's Bay. They were life-forms, but were inferior to others of the kind as to material and workmanship, and had various perforations made before baking in the body of the vessel, as well as the customary one at the base. It is interesting to note that the general deposits of earthenware were nearly always in the eastern part of the mound. Cremation appears to have been practised only occasionally in northwestern Florida. This memoir is copiously illustrated.

—'The Red Miriok,' by Anna M. Barnes (Philadelphia: American Baptist Publication Society), is a story of the life of an American missionary family in Korea, the basis of which is the account of a boating trip up the River Han, with interesting glimpses into the minds of the people of white robes and big hats. The author may have lived in Korea and probably did, though, in a story picturing so strange a land and people, one would gladly have less American and more native local color. The title word "Miriok" has reference not to the colossal stone structures known to travellers, but to a little image of Buddha stolen from a monastery, which the boatman Kitze kept on his person as an amulet, the adventures of which form the chief subject of the story. The illustrator has certainly not been in the peninsula, for his Koreans are all Chinamen, in dress, even to the pigtail, in pose and in manner. Nevertheless, this story for young people is a good one, wholesome in tone and full of movement. Bound with the volume, making nearly equal bulk, is a collection of "Shan Folk-lore Stories," from the hill and water countries, by William C. Griggs, M.D. The nine illustrations are by native artists in true Burmese style. In Shan land the hare is the same brainy and nimble creature as his brother in Korea and Japan and among the negroes of the South; only, the Shan "Brer Rabbit" deceives not the monkey, or the badger, or the fox, but the noble tiger. The Shan tortoise also has wonderful powers of transformation, and the sparrow is as remarkable for his accomplishments as in Japan. The Shan world was created because "the Great Spirit Spider felt weary with carrying round her heavy burden of eggs." Weaving her web upon the waters, the winds blew, and the solid matter, caught in the meshes of the web, became earth, which kept the spider-eggs warm, and in due time the first man and woman were hatched out. Instead of the Japanese *oni* or the Burman *nat*, the semi-celestial busy-body and wonder-worker is the *hpea*, who is universally feared and propitiated. He lives in the forest, watches over wells, tanks, and lakes, and often neither honey nor firewood can be got out of the tree in which he lives, even though men starve or shiver. In this folk-lore, the hero does not marry and live happy ever after, but becomes the king of the country, not "governing," but "eating" it—a suggestive expression, reminding us of the "bosses" in New York and Pennsylvania.

THE "UNKNOWN" AND THE KNOWABLE.—I.

Unknown Mexico: A Record of Five Years' Exploration among the Tribes of the Western Sierra Madre; . . . Tepic and Jalisco; and among the Tarascos, etc. By Carl Lumholtz, M.A. 2 vols., illustrations and maps. 8vo, pp. xxxii, 530, 496. Scribners.

So long ago as 1887, Mr. Carl Lumholtz (who had already with some seriousness explored "Among the Cannibals" of Australia) came to harbor a hopeful dubiety whether the dead but still alluring "Cliff-Dwellers" of our Southwest might not have their fellows still quick amid the abutting wilds of northwestern Mexico. In that "little-explored" desolation there could be almost anything—and surely nothing better worth discovery by the new school of discoverers. Coming to the United States in 1890, he found sundry and illustrious patrons to share the like pious suspicion of buried treasures next door; and very presently he was duly sinewed to go forth and see. The outcome, thus far, of this worthy if inexpert wonderment has been four several invasions of Mexico, interrupted by some fallings back upon the financial base of supplies, but in fact fulfilling five round years of patient burrowing in regions it already pleases us (who are so soon willing to let bygones be bygones, as to history) to reckon "unknown"; a number of magazine articles; a large monograph on the Huicholes; and now two big, handsome, and truly respectable "popular" volumes on 'Unknown Mexico.'

There will be—there can be—no fuller and no more ready appreciation of Mr. Lumholtz's growth in grace of science and the expeditionary art than from precisely such as with most misgiving beheld his maiden descent upon Mexico, unhampered by a single preparation, linguistic, geographical, or documentary. He had not a word of the language which is the universal *picaporte* from Arizona to Patagonia; nor of any other tongue maternal to any person within the area to be studied; nor a shred of those documentary alleviations of the beginner which have been compiling for much better than three centuries. All unconsciously, this work is a record of growth. Even from the frontier side, the expedition began "Tenderfoot"—with thirty men, counting cooks, scientists, and mule-drivers, and "nearly 100 animals." But Mr. Lumholtz learned—if at first, perhaps, by constriction of resources, later by native wit. Approximately four-fifths of his exploration was by himself, sole—save only for the few Indian or Mexican packers and guides, and the small "train" needful to transport his outfit and collections.

Neither prepared nor inspired, he has, nevertheless, and by sheer dint of painstaking, made a worthy contribution to the literature of popular-scientific travel. Earnest but sane, eager but patient; of a certain homely good nature and cheerfulness which is the first qualification for any travel; handsomely endowed in the tolerance without which whatsoever ethnologist were better cast into the sea, he has so admirable individual equipment that one is the more regretful for his almost utter lack of the sharp tools whetted by the pioneers.

"It seems to me," he writes, "after my long experience with the Mexican Indians, that in their natural state they are in certain points superior . . . to the common run of whites. . . . We are brought up to look upon primitive people as synonyms of all that is crude, evil and vicious. Nothing could be more erroneous. . . . People who live in close touch with nature are in fact not capable of being as perverted as civilized criminals are in mind and body. . . . It is a very common mistake to look upon a barbarian as a third-rate white man. The Indian's physique is better developed, and his senses are better trained, than the white man's; his intellect and clearness of thought average higher than the common people's of Europe and America. . . . Beyond comparison, both men and women know the flora of their country better than even the cultivated classes among ourselves. . . . Monogamy is the recognized foundation of the family, and the social standing of the woman is that of a junior partner. In their behavior toward one another, these Indians never become beastly, as low-class whites will. . . . Personal modesty is innate in the race. . . . Justice with them is inexorable. . . . In his behavior toward his tribesmen as well as toward strangers, . . . though dressed in rags he is a born gentleman, and as polite and considerate of other persons' feelings as any one adorned in purple and fine linen. . . . In their religious fervor the aborigines of Mexico have no equals, certainly not among Christians. . . . I cannot help thinking that, as long as Mexico was to be made subject to European powers, it was well for her to fall among members of a Latin race rather than those of Germanic or Teutonic descent. For the Spanish character and temperament resemble in a degree those of the Indians. . . . Modern civilization is even more intolerant in contact with people of lower culture than were the Spanish conquerors of Mexico and Peru. . . . The Spanish, after subduing a people, did not crush out their virility."

And so on, in many refreshing touches. To this tolerant spirit, add a style unaffected, ordinarily agreeable, generally

lucid, and frank to the verge of naïveté. The upwards of 1,000 pages of the book furnish much more than the "good reading" they certainly are. Judged as "travel," here is far better than the wonted share of information, digestible to the layman, but perhaps worth most to the student who can supply the historical context the author lacks. No one else of modern times has besieged the tribes of the Sierra Madre with so dogged particularity, nor any one of any time for so long a term in the general light of to-day. Here we have corroboration and detail of facts recorded centuries ago, indeed, but in no danger of being too often or too deeply studied.

The half-decade of this honest, earnest, and important field-work was unequally but impartially (and somewhat fortuitously) divided between the Tarahumares, the northern and southern Tepehuanes, the Huicholes, the Tepecanos, the "Tubars," certain centrifugal Nahuatl, and the tribe celebrate in a cherished *dicho* (of more than trivial worth to the folklorist) by that erudite Mexicanist, Father Fischer:

> "India que nacistes en Tasco,
> Sin tenedor ni partera—
> Tu madre una tamalera,
> Tu padre un indio Tarasco."

The longest sojourn was the year and a half with the Tarahumares; next in importance, ten months among the Coras and Huicholes; the rest of the term, "scattering." "Of most of these tribes," says Mr. Lumholtz (xiv.), "little more than their names were [*sic*] known, and I brought back large collections illustrating their ethnical status, besides extensive information in regard to their customs, religion, traditions, and myths."

The latter member of this statement is true. If it had had no other fruits—and, besides his collections, his sixty graphophone records, his twenty-seven new plants, and one new mammal, there is much other and admirable harvest—Mr. Lumholtz's exploration would be justified of all its cost by its contribution to our knowledge of the remarkable cult of the Peyote. Significantly kin to other vegetal fetishisms familiar in anthropology—and notably to that of the Cuca in Peru and Bolivia, of which, however, we have as yet no equal modern synthesis—the complex esoterism that has grown up around this echinocactus of ecstatic properties has been historic for above 300 years, and among far more tribes than the author seems to dream. But, in the elder days, these superstitions, so palpably of the devil, were apt to be set down in the record without indecent lingering. Mr. Lumholtz has secured, and presents, a large and valuable mass of detail as to this curious devotional drunkenness—for we cannot too sharply remember that the intoxications which so ubiquitously and so bitterly grieved the apostolic pioneers of Mexico were almost exclusively of ceremonial character.

For reasons doubtless known to himself, Mr. Lumholtz prefers to call the Peyote by a name which is not historic, if, indeed, it has before been printed—"Hikuli." Whatever sound is intended to be conveyed, it is rather safe to say that this does not spell it. In all human probability what he means would be, in this region, written Jiculi. As to this, by odds the most important theme between the covers of these sumptuous volumes, there is neither comparison nor etymology vouchsafed. For the latter, a glance at the pictured plant is enough to show its strong resemblance to a navel; and the guess is neither far nor hazardous from the nondescript new word to an Aztec *Xiquilitl*, compound of *Xictli* (umbilicus) and *Quilitl* (vegetable; source of the now familiar Southwestern provincialism *quelites*, for "greens" and garden-stuff). The conjecture is sound etymologically, while from the point of aptness and "Indianness" it leaves nothing to desire.

We have here, also, our fullest up-to-date detail of the deer-cult, the ceremonial races, the esoteric etiquette of birth, marriage, death and the sequent ghost-scaring, and many other ethnologic data as to the tribes in question. All these contributions are interesting; practically all of them seem sound—and we have a long array of record by which to check them. The tribes of the Sierra Madre were well described before 1550. It is, perhaps, surprising that almost every author who between 1550 and 1800 wrote of these Indians, mentions in at least generic terms the very facts of ethnologic importance with which these new-century volumes chiefly deal. Perhaps it is no less surprising that the modern author seems hardly to have heard of any of these predecessors, and in no wise to have benefited by them—if we except trivial allusion (without date) to Father Fonte, who described the Tarahumares almost three centuries ago, and a few other as loose and unscientific references.

Two cardinal defects seriously afflict a work of whose many admirable qualities a hint has been given. It is not unreasonable to hold a twelve-dollar book—widely heralded as relating "remarkable discoveries," and as "one of the most important records of successful scientific explorations in recent years"—to rather stricter accountability than we need demand of the cheap and confessed mere beguiler of an hour. "Popular" in a proper sense such a work fitly may be; but there is an implied contract that it shall be also "prepared" and ripe. Interesting it must be; but it is not destined to be read exclusively for amusement. Aside from entertaining details, it is expected to give the lay reader some fair general concept of the themes it deals in. Certainly, in the scientific aspect, it is now late for too much and too Columbian "discovery." The New Worlds are mostly found, though our monthlies still do seriously incline in their quest. On the first page of his preface, Mr. Lumholtz avows that his first attraction to Mexico was hope of finding there still-extant "Cliff-Dwellers." This has rather persisted as a keynote, in so far as the hum of his remote activities has reached the popular ear. In this deliberate work, printed thirteen years after his actual launching upon the quest, there appears a certain disingenuousness as to this rather important head. No blazed tree at its side, nor sensible jog in its continuity, warns us when we are wiled off the trail to a new path. "What went ye out for to see?" Why, Cliff-dwellings—something comparable to the astounding, enormous, and architecturally triumphant monuments of the prehistoric Pueblos, whose castled communal towns still beetle upon and in the cliffs of New Mexico, Arizona, and their northern adjacencies. And what do we emerge with seeing—and even that as through a glass, darkly? Why, a second-hand sort of cave-dwellings. When or how we left the right-hand path, and why we fetch up as we do, we are left to guess. For there is neither premonishment nor explication. How came we here? *Quien sabe?* Here we are.

"Although it may be said that houses are their main habitations, still the Tarahumares live in caves to such an extent that they may be fitly called the American cave-dwellers of the present age" (I., 160). "Although thus far [up to April, 1891, a few months in the field] the question regarding surviving cliff-dwellers was answered negatively, the field southward in the Sierra was so promising that I felt eager to extend my explorations" (xi.). "Still, the fact of there being cave-dwellers to-day in Mexico was until recently known only to the Mexicans living in their neighborhood" (I., 161). "The largest inhabited cave I have seen was nearly 100 feet in width. . . . I heard of one arroyo where six inhabited caves . . . can be seen at one time; but this is a rare case. In one place I saw a cave, or rather a shelter under a big boulder, utilized as a dwelling" (I., 167).

And so on, in several variants of the off-hand, too-familiar-to-mention style. It requires tedious back-searching through the 1,000-page record—for the alleged index is "*mocks*" *et prœterea nihil*—to count up that Mr. Lumholtz says he has really seen, in his five years of pursuit, certainly two (and it may be four, for the case is not clear) inhabited caves. He pictures apparently four, but without hint if these be identical with the Terrible Examples of the text. There is one Sierra Madre (in northern Mexico, that is; there are many otherwhere), and Æsop was its prophet. No reminder here of a tolerable difference between even such "cave-dwellers" as habitually live in houses part of the time, but semi-occasionally shelter under the natural concavities with which the ravines of their land innumerably abound, and "cave-dwellers" of the variety of the New Mexican Shu-finné, the Pu-yé, and the incomparable Rito de los Frijoles, who made caves to dwell in, and in them sempiternally and uninterruptedly dwelt. If all that incidentally and occasionally linger under protective rocks, or even build partitions where nature furnishes ready-made three of the six sides of a room, are to be included, then Mr. Lumholtz can find still in New Mexico, Arizona, Colorado, Utah, and California some few English-speaking persons as "fitly to be called American cave-dwellers of the present age"—and more of them than he specifies having discovered in the Sierra Madre of Mexico. It is not too much to say that this general indirectness is at least unscientific. Let us hope that it is not even up to the magazine traditions.

There is some prognosis of a like inflammation of the popular chords in the unretracted statement (ix., x.): "The northernmost portion of the Sierra Madre del Norte has from time immemorial [which is not exactly true] been under the dominion of the wild Apache tribes. . . . Not until Gen. Crook, in 1883, reduced these dangerous nomads to submission [to the which they were not even approximately reduced, save by gasps, until some four years later] did it become possible to make scientific investigations there; indeed, small bands of the 'Men of the Woods' were still left, and my party had to be strong enough to cope with any difficulty from them. Inasmuch as my expedition was the first to take advantage of the comparative security prevailing in that district"—and so on for quantity.

The pinch of the humor of this is that precisely in the last of 1883, and through most of 1884 (six years before "the first to take advantage"), Bandelier trudged, on foot, unarmed and solitary, over this same territory. It *was* dangerous. It was a higher rate of hazard than San Juan Hill. But perhaps only the grave Crook, or Bourke, or Crawford, could have done justice in a single smile to the party Mr. Lumholtz elected as "strong enough to cope" with the Chihuicahui tigers. In justice it must be added that this is far outside the average tone of the book. Its normal air is unbraggart and uncomplaining—even unmagnifying and cheerful under deprivations very real and deplorable to almost any person habituated to the inconveniences of civilization.

ASSOS.

Investigations at Assos: Expedition of the Archæological Institute of America. Drawings and photographs of the buildings and objects discovered during the excavations of 1881, 1882, 1883, by Joseph T. Clarke, Francis H. Bacon, and Robert Koldewey. Edited with explanatory notes by Francis H. Bacon. Part I., 74 pp. Folio. Cambridge, Mass.: The Archæological Institute of America. 1902.

The site of Assos is an isolated volcanic hill more than 750 feet in height, lying on a narrow strip of land only about a mile wide, between the river Satnioïs and the Gulf of Adramyttium, opposite Lesbos, on the southern shore of the Troad, about thirty miles from Troy. The small summit of the hill, on which are seen no indications of any ancient building except a temple, was the crater of the volcano, choked by a second flow of andesite which has well covered the limestone at the foot of the hill. The temple was as conspicuous as that of Sunium—"Colonna's marbled steep"—rising as it did far above the city, and the position of the city was marked and commanding. Before the foundation of Alexandria Troas, about twenty miles distant, near the close of the fourth century B. C., Assos seems to have been the chief city of the Troad after the fall of Ilium. Its harbor was artificial, being formed only by a mole, of which a large part has now nearly or entirely disappeared; but for a thousand years the place has had no importance except for this slight shelter of ships. The Apostle Paul went on foot from Troas to Assos, and there joined his companions, who had journeyed by sea. At present the Turkish village of Behram on the slope of the hill is made up of a hundred miserable huts; but fifteen or twenty boats are generally at the mole receiving their lading, which consists chiefly of the husks of the acorns of the valonia oak, which are brought to the port on the backs of camels and are exported for use in tanning. The wheat for which the region was so famous that it was used for the bread of the Persian king's table, two thousand miles away, is not now raised in sufficient quantity to supply local needs; the Turkish inhabitants are not fond of tilling the soil.

Assos was noted for its "flesh-eating" *(sarcophagus)* stone, which gave its name to the whole class of stone coffins found here more abundantly than anywhere else. Many of these great monolithic sarcophagi, eight feet in height and large in proportion, are described as still standing in the cemetery. All which were exposed to view were broken open long ago for the sake of the ornaments and other treasures buried with the dead. Early travellers write of seeing kids and lambs take shelter in them, and many others are used as water troughs in the neighboring villages. One hundred and twenty-four of these, however, were found unopened by the American expedition. This "flesh-eating" stone is the ordinary andesite of the hill. Of it the walls and other structures of the city were built, except that volcanic tufa was chosen for certain ornaments, gargoyles and acroteria, of the temple. The stone, being quarried in blocks by the simple process of wedging—with planes of cleavage approximately horizontal and vertical—afforded excellent material for city walls and buildings, but was too coarse-grained and intractable for use in ornamentation, and certain usual decorative features of the temple were omitted. In an early report Mr. Clarke promised to speak of the chemical properties of this stone, but he has not done so.

A good argument is made to prove that Assos stood on the site of the Homeric Pedasus, which was the early home of one of Priam's wives (Iliad, xxi. 87). Pedasus was a "lofty town on the banks of the Satnioïs," and no other lofty site is found on the banks of that river, which, though it is within a mile of the sea at Assos, does not reach the Ægean until it has had a further course of about twenty miles. In the fourth century B. C., Assos was for three years the abode of the philosopher Aristotle, who there visited his friend and connection by marriage, the "tyrant" Hermeias; and a little later it was the birthplace of Cleanthes, who succeeded Zeno as the head of the Stoic School.

The site of Assos was deserted early enough to leave the buildings and walls in fairly good condition, so that Colonel Leake, the admirable traveller and topographer, who visited it in 1800, wrote that the theatre was in very perfect preservation, that remains of several temples were lying on the ground, that on the western side of the city the walls and towers with a gate were "in complete preservation," and that "the whole gives perhaps the most perfect idea of a Greek city that anywhere exists." A year later, in 1801, Dr. Hunt, who accompanied the Earl of Elgin's embassy to the Ottoman Porte, wrote of the temple on the citadel that "parts of the shafts remain on their original site, so that a person conversant with ancient architecture might easily trace the plan and different details." Neither Leake nor Hunt, however, mentions marble remains, and the American explorations showed that no scrap of this stone was left above ground, and very little below. Clearly, limeburners pillaged the site with care some centuries ago. Since so much lime could not have been needed for such an insignificant settlement as seems to have existed there for a thousand years, the suggestion is not unreasonable that lime may have been exported thence as an article of commerce, although the unsubstantial modern huts, needing renewal every few years, and requiring much mortar because of the difficulty in reducing the hard stone to the exact shape desired, use a vast amount of lime.

The change in the condition of the ruins in the course of the nineteenth century was very great, and the observation of it emphasizes the truth that the archæological renaissance came in the very nick of time. Just as the irreparable loss of ancient manuscripts of the works of classical literature would have been vastly greater if the literary renaissance had been delayed for two centuries, so a like delay of archæological interest in ancient structures would have resulted in great damage. In each case the destruction seems to have become more rapid in the later centuries before the revival of interest.

After the visits of Leake and Hunt, the Turkish authorities in the first third of the nineteenth century built extensive fortifications on the citadel, probably under the influence of the Greek war for independence, in view of the proximity of the island of Lesbos and its large Greek population; and the American explorers found no stone of the temple upon another. In 1838, the reliefs of the epistyle and the metopes of the temple, so far as they lay above ground, were removed to Paris and placed in the Louvre. In 1864, the buildings and walls of the city, and particularly the theatre, served as a quarry for the Turkish Government, which had the largest and best blocks of stone removed to Constantinople for its public works there. The Turks even demolished the chief entrance gate of the city, an admirable monument of military architecture. The theatre, which had been more perfectly preserved than any other in Asia, was "transformed into an enormous quarry," and became "little more than a hollow in the deep hillside." With this procedure may be compared the action of another Turkish official, who, during the excavations on the site of ancient Troy, sent a squad of men to Dr. Dörpfeld with a requisition for the finest blocks of stone uncovered in the course of his work.

In June, 1879, the site of Assos was visited by J. Thacher Clarke and Francis H. Bacon, young architects of Boston, and chiefly on their recommendation it was selected as its first field of explorations in classical archæology by the recently established Archæological Institute of America. Although the sculptures which remained on the surface of the ground had been carried to Paris, the earth had not been overturned either by authorized excavators or by peasants in search of plunder. The work of surveying was begun in April, 1881, and that of excavation, after many delays in obtaining the promised necessary *irade* from the Turkish Government, in August of the same year. The number of laborers employed, some of whom had been trained by Humann in the excavations at Pergamon, was about thirty-five, and the work continued until the termination of the permit in May, 1883, interrupted not by the heat of summer, as in Olympia, but by the inclemency of the winters. The work was so completed as to win praise from those who have seen it. Of the portable objects uncovered, two-thirds were taken by the Turkish Government and the other third was given by the Institute to the Boston Museum of Fine Arts, the cost of the expedition having been borne chiefly by those who were interested in that museum. The explorers declared their satisfaction with the division, and when we remember that theirs was the last expedition to be allowed a share in such discoveries in Turkish lands,

we may be grateful that so valuable archæological monuments came to America.

The preliminary report of the American explorations at Assos was published promptly in 1882, as the first volume of Papers of the Archæological Institute, Classical Series. Brief summaries of the investigations in the second and third years were presented in the annual reports of the Institute, but the fuller account was delayed. Mr. Clarke became so engaged in other work that he was unable to prepare such a complete and scientific statement as he desired to make. A portion of his final report was published in 1898 as the second volume of the Papers of the Institute, Classical Series, devoted chiefly to the architecture and sculpture of the temple on the acropolis, giving much attention to the elucidation of the processes of construction, and considerable space to a discussion of the date of the erection of the temple. The completion of this final report is now not considered probable, and the Council of the Institute wisely determined to publish the plans, which had been made with great skill and care, with brief explanatory notes by Mr. Bacon, and an introduction made up from Mr. Clarke's reports. This publication is the more important, since that by Texier, in 1849, of the French explorations at Assos in 1835 has been shown to be extremely inaccurate, and covered only part of the ground.

The 'Investigations at Assos' is to be published in five parts, of which the first is before us, containing Kiepert's excellent map of northwestern Asia Minor, sixteen pages of text, including seven plates; seven pages of inscriptions, with their elucidations by Professor Sterrett of Cornell University; seven pages of photographs, and twenty-one plans—all relating to the Agora, the Stoa, and the Bouleuterion. Some of these plans, naturally, are of interest only to architects and archæologists, but not a few are of more general interest. For example, Mr. Bacon's plan of the Agora, showing the relative positions of the public buildings—the Bouleuterion or Hall of Deliberation, the Gymnasium, the baths, the Stoa, the theatre, and the like—and marking the paved streets, gives a more lively view than might have been anticipated of the public life of the city; and his restoration of the Agora is full of spirit. The Stoa, where the men gathered in a social way, protected from rain or from sun, stood on the slope of the hill, and had two stories, which made it unusual if not unique. The illustration of the ancient processes of architectural construction is interesting, also. Most of the plans in this part of the publication were drawn by Mr. Robert Koldewey, a Prussian architect and archæologist, at present in charge of the Babylonian excavations of the German Oriental Society, and who was at first a volunteer and then a regular member of the exploring expedition, and to whom the Agora and the buildings about it were assigned in the division of the work. We regret that, from lack of the archæological discussions which Mr. Clarke was best qualified to give, the investigations at Assos will not throw so much light on ancient Greek public life as was at one time anticipated, but these photographs and plans do more than they could fairly be expected to do in presenting a view of the ancient city.

MORE NOVELS.

John Percyfield. By C. Hanford Henderson. Houghton, Mifflin & Co.

The Blue Goose. By F. L. Nason. McClure, Phillips & Co.

Calvert of Strathore. By Carter Goodloe. Charles Scribner's Sons.

The Deeps of Deliverance. By Frederik van Eeden. Translated from the Dutch by Margaret Robinson. G. P. Putnam's Sons.

A Daughter of the Pit. By Margaret Doyle Jackson. Houghton, Mifflin & Co.

Six Trees. By Mary E. Wilkins Freeman. Harper & Brothers.

From a Thatched Cottage. By Eleanor G. Hayden. Thomas Y. Crowell & Co.

From the Unvarying Star. By Elsworth Lawson. The Macmillan Co.

Lees and Leaven. By Edward W. Townsend. McClure, Phillips & Co.

The Pit. By Frank Norris. Doubleday, Page & Co.

Mr. Henderson calls his book an "Anatomy of Cheerfulness"; it is rather a study in self-complacency and egotism, in which the hero indulges in some four hundred pages of sentimental monologue with an average of a dozen I's to a page. "John Percyfield" belongs to one of the first families of Philadelphia, and the reader is not allowed to forget it. The punctiliousness of the Percyfields, their lineage "that has come down unspotted from that first Mr. Percyfield of whom we have any knowledge, the one who was esquire to William the Conqueror," their fastidiousness as expressed by the hero of the present work when travelling in the West, "I found a very shabby car, with cane seats and bare floor, and 'second-class' written very large all over it. It was not the sort of an affair that the Percyfields commonly travel in"—of all this one soon grows weary. But the book has its surprises: Percyfield is a seer of visions, and accepts his nocturnal visitations as the most natural thing in the world. It is here, if anywhere, that one is expected to detect the resemblance to 'John Inglesant' pointed out in the publishers' notice. But Mr. Shorthouse never ventured on such a flight as the following:

"Quite without warning or preface of any kind, I suddenly found myself, that is, my thinking self, entirely outside of my body and entirely detached from it save by a slender bond on the left side. I saw my body sitting there in the armchair, complete from head to foot, sharp and distinct. . . . And then I saw around the body, projecting from it six or eight inches, I should say, a slightly luminous gray cloud. It had the enlarged form of the body and enveloped it completely."

The precision of this reminds one of Professor Sidgwick's serious exhortation to his friends to lose no opportunity that might occur for photographing a ghost. Mr. Henderson, too, evidently intends us to believe in the objectivity of such appearances. "'Look,' she whispered, . . . and I saw a faint gray cloud detach itself from the quiet body, like a symbol of the spirit that was passing, and ascend into the void space above us. Had it not been for the Châtelaine, I should have counted it an illusion." The climax is reached when a whole family of ghosts call on the hero in a house in Broad Street, Philadelphia.

We do not dwell upon the plot of this romance, for there is none. The scene is laid chiefly in Switzerland, and in parts it reads like a guide-book. A fair specimen of the style, which is high-pitched, emotional, and intimate, is the following:

"I got up, and in the moonlight took my cold, refreshing bath. Everything was so white and unreal that I seemed to be bathing a marble statue, but I knew that under the white limbs the blood was running hot and red, and under the marble chest a heart was beating high with hope."

'The Blue Goose' is one of those tales of commercial enterprise in the West which threaten to rival the colonial romance. Given a precise and lavish use of the technical details of some business, a determined manager for hero, a gang of mutinous workmen with a socialistic agitator, and the rest is stereotyped. In the present instance, the scene is laid in a gold-mining settlement whose evil genius is the owner of "Blue Goose," a gambling and drinking-saloon, which, in the inevitable strike and wholesale destruction of property, is hoist with its own petard. The heroine, as usual, plays a slight but undaunted part in the business troubles of the hero, whom we leave triumphant, sitting like Marius amid the ruins of the company's machinery, after promiscuous shooting has relieved him of all the undesirable characters. This is not a type of fiction to which one looks for the effects of art. But the moral tone is high, the amount of technical information conveyed is really amazing, and the whole reminds us of certain serial tales in the 'Boy's Own Paper,' in which the youthful reader is encouraged to skate over a column of instructive facts by the certainty of finding his hero landed at the end of the chapter in some blood-curdling *impasse* from which he will not be extricated till the next number.

It does not appear in the Gouverneur Morris Journals and Correspondence that a young man named Edward Calvert was constantly at his side, dining, driving, plotting, rescuing, ear-witness of his bonmots, his society verse, his interviews with statesmen and royalties. But Calvert of Strathore was there, according to Mr. Goodloe's novel, Morris's trusted and beloved young friend, Jefferson's secretary and pet, Gilbert Stuart's admiration, Marie Antoinette's best-believed-in hope of rescue. Such is historical fiction. We thank Mr. Calvert for being in the third person; it softens his perfections; and when all is said, although the novel opens in a rather dull and stilted way, it proves extremely interesting as it proceeds. The story of the French Revolution from the American Legation's point of observation is none too hackneyed. It is well for novel readers to be reminded of the underlying influence of the American idea, to recall that the bloody culmination came from a slow-growing political root. The French Revolution of fiction and stage to-day is mere brutal situation. The more measured pace of this little book affords a useful complement to the usual story-teller's version. It is no dispraise, rather the contrary, to say that the Morris diary has furnished most of the facts, while the young hero's love story is quite pretty enough to justify itself for going hand in hand with the weightier matters of state and for occupying the attention of statesmen.

The publishers' word upon 'The Deeps of Deliverance' runs in part as follows:

"The most distinguished living Dutch writer, Frederik van Eeden, like Tolstoy and like Gorki, is an artist who concerns himself with the more intimate truths of life. The present work, which is inspired by a profound if unconventional feeling, tells the life-history of Hedwig Marga de Fontayne. It traces the evolution of the soul of a woman with a singularly daring realism, but a realism marked by a moral significance."

To this we will add that Hedwig's soul was developed exclusively through her body, and that a thorough review of the book would be a medical treatise, and as inappropriate general reading as is the book itself.

Mrs. Jackson's novel is about the coal-pits of Middleford, otherwise Manchester. The story itself is naïve, even amateurish, but it amply suffices as vehicle for impressions of life among English miners, conveyed with exceptional clearness and fidelity. We have the usual coal-mine tragic episodes—strikes and fires and treachery; but we have an added picture, not often exhibited, of the daily comings and goings in the underground city, where beside the horrors walk the figures of kindliness, daily loyalties, and amazing sense of duty—grim and gaunt, it is true, but with hope and home at the end of the day's work. Mrs. Jackson's description is the more impressive in that she herself lived in the suburbs of Manchester in her girlhood. The simple force of her story comes directly from her having seen what she writes about.

Mrs. Freeman's old men and old women of all ages maintain their peculiar charm; her incidents in most cases their agreeable prick. The trees, all things considered, bear less mark of having been lugged in by the roots than one would have expected on finding the accomplished author converting her New England figures into an arboretum where one might dread to see men as trees walking. In fact, it is interesting to find that, except for the titles and a trifle more of description, there is little more about trees than heretofore in her stories—for the seasons and the living, growing green things make life for such farm and village folk as Mrs. Freeman has immortalized; and, behold! she has always made it so without weaving the fact into her title. If the snowball bush and the syringa tell her world that spring has come, no less do the trees mark for them the longer periods, and set them to dreaming of the lives that have risen and set while yet the tree has been completing its protracted childhood and faithfully blooming on in green longevity. When her subject draws the writer into description more elaborate than her wont, it is of a fine and feeling sort. There is a poem in the page that tells of the dreamer to whom the great pine spoke in summer of winter and in winter of summer.

'From a Thatched Cottage' is worth reading if only for the delicious dialect, the dialect of English downs, of shepherds and poachers, of village housewives and village "layers-out." "Ter'ble middlin'" is, in the language of Selwood, "powerful soothin'"; "illcomevanient" shows what improvement common sense can make upon mere philology; "innerism" for "incendiarism" ought to be equipment for a detective; "a bit yea-nay" of a hesitating wooed one breathes of yielding and orange blossoms; "sponder" for "ponder" has a kindly air of throwing light on the difficulty. But there is more to recommend the book. First, some capital characterization. The old shepherd, queer and lovable; Keziah, "just a nice comfer'ble woman"; Patty Puddledock, a very uncomfortable woman, and her meek husband, are effective sidelights; while the principals, if drawn on more conventional lines, are satisfactory. Finally, there is a good story, somewhat repetitious, but nowhere dull, the groundwork, over which lesser interests throw their tracery, being a hot-headed murder, its effect for the rest of his life on the unconvicted murderer, and his final self-sacrifice, bringing peace to his half-mad brain. The workmanship is excellent throughout, and the air of the downs makes the book like one read at an open window.

'From the Unvarying Star' tells the story of a liberal preacher who came to a small Northumbrian parish, and met there his fates of various sorts. The book is really a sermon, broad and charitable, not on the hackneyed, loosely defined lines of breadth and charity, but fresh, sane, genuine. The vehicular fiction is somewhat crude and self-conscious. The Northumbrian landscape, as well as the religious utterance, is plainly, in the words of an old English author, "written out of experience."

There used to be in olden times a type of novel called the Industrious and Idle Apprentice story. It had a strong man and a weakling; a sweet, hard-working girl and a frivolous, pleasure-loving one; a railroad or stage-coach accident, a lost deed, and a wedding at the end. The type survives, *mutatis mutandis*—in book-binder's phrase, "old calf rebacked." Mr. Townsend's book is of this class, enlarged and modernized. It has several strong men and several weak ones, several sweet girls and weddings; many eccentric, even burlesque characters—all more or less original and bespeaking kindly attention. The author has made a good plot, and held up a vivid picture of a temptation to dishonesty arising from mere opportunity. The scene lies mainly in New York—that shady New York which Mr. Townsend depicts so well; its prominent revelations relating to the inner conduct of "live journalism." He contrives to keep his shady places as free as possible from mud, so that the book remains readable, unlike some cautionary literature.

If Mr. Wister is the Novelist Laureate of the Cowboy, the late Mr. Norris should have held the same title as to Wheat, whose epic he has sung with magnificent force and stir. 'The Pit' offers a wondrously vivid representation of the swirl and pull of the "undiked Ocean of the Wheat" as it surges round the Chicago Board of Trade. Reading, one seems to be at the mercy of an appalling whirlpool, and to see one's maddened fellow-beings wheeling, whirling, sinking, then hurled from the maelstrom to fall back and begin again the horrid circuit. Hideously real is the deal in the wheat pit, with all its side issues, its demoralizations and tragedies. The vociferous note of Chicago's works and ways is ever at the reader's ear. The rushing interest of the story holds his attention like a vise, while he seems to be fixed in the heart of a factory with all harsh sounds clanging and all machinery roaring, not only in respect of the pages given to the business life of the Great Gray City, but in the scenes of so-called domestic quiet. The portraits are good, in a style of ultra-detail. The development of the two-souled heroine makes a strong study and companion-piece to that of her husband, the great speculator. A Titan he, fighting Titans, beaten only, as his arch-enemy says, by Wheat itself. For the novel reader who looks for poetic justice, the sword of judgment falls too lightly on him, the "Great Unknown Bull," who wrecked so many lives in wantonness. One would like to see him at least repentant. For poetry, we must look farther—to the flow of the great stream of the wheat from the seed to the hungry markets of Europe—a sight made finely visible by the writer's imaginative yet direct way of seeing and saying. And there is a powerful moral in the spectacle of commercial gambling and its victims. But how unlovely a world is even the better part of a world where Bigness is the deity! In vain do music, art, books, nature, put in their pleas. The fingerprints of the great gods Size and Noise are on every page.

Chinese Porcelain. By W. G. Gulland. With notes by T. J. Larkin, and four hundred and eleven illustrations, arranged chronologically. Vol. II. Pp. xxxviii, 506. London: Chapman & Hall; New York: Charles Scribner's Sons.

The book published in 1898 under this title and reviewed in these columns at considerable length has just been followed by a second volume, in which the subject is taken up where it was dropped; that is to say, the general account of porcelain in China is succeeded by an historical inquiry, and, after a brief introduction, we pass without break—without mark of chapter, book, or section—into the chronological treatment, beginning with the epoch from 1506 to 1522, and going regularly on to 1875, at which date the book closes. Each separate epoch is denoted by the emperor whose name represents it in common chronologies. Of the great times of the Ming dynasty little is said; largely, we may assume, from lack of material. There are but few pieces of porcelain within the reach of an Englishman living at home that can be accepted by him and criticised as "real Ming" vases or plates. It appears, however, that the author does not respect the porcelain of the Ming times as much as do most collectors and writers on the subject. The old theory, very commonly accepted, is that the Tartar conquest by which the Ming dynasty was brought to a close, brought with it decadence in the decorative arts of China, and that these were long in regaining their strength, and never regained quite their refinement and their significance. To the princes of this older dynasty but two pages apiece, or sometimes less than a page, is allowed.

With the reign of the conquering Emperor Kang-hi, or Kang-he, the subject assumes more interest for Mr. Gulland, and to this reign alone is given nearly ten times as much space as is allowed to all the preceding reigns together. It is at this point in the chronological sequence that the attempted analysis of the decorated porcelains is given. Here comes in the division between *famille verte*, blue and white, *aubergine*, and the rest; and here is the mention of "foreign influence" and of Kakiyemon, who is considered to have

been an early Japanese maker of porcelain, and to have given his name to a whole class of objects, many of which are now known to be Chinese. It is evident that with our author the historical examination of his subject begins with the Mongol dynasty, and that the present volume is an attempt at the history of Chinese porcelain from 1661, with a few unconnected remarks about the earlier times.

The book is not systematic. One piece after another is taken up and described with some reference to the photographic representation of it. It is like the talk of a collector showing his own treasures to a sympathetic listener. And this impression is made stronger by the absence of any clear statement as to the place of any piece. Are they all in the South Kensington Museum? Not so; for at least one is located for us, "Mr. G. R. Davies's celebrated black vase" (p. 370), which the owner himself has described for the author. Like the paging, the numbering of the illustrations is continued from the first volume. The first in the new book is No. 486, and the highest number reached is 896, so that the two volumes taken together give certainly an enormous number of examples. It cannot be said, however, that the half-tone process is well adapted to such illustration as this. Curvature of surface and delicacy of painted adornment are alike beyond the reach of the coarse gradation producible by the mesh. Nor are these the best half-tones conceivable, though they are of good average merit.

Trees and Shrubs for English Gardens. By E. T. Cook. New York: Charles Scribner's Sons. 1902.

"The word 'English,'" we are told in the preface, "of course stands for the British Isles." The range of climate in the British Isles is so much greater than that of England alone that a treatise covering the former must be more likely to contain matter of interest to horticulturists in Eastern North America than if it were restricted to England alone.

The book possesses, among other excellent qualities, an attractive typography, fine illustrations, and an earnest style. It is easy for a writer on amateur gardening to drawl along in an empty manner, uttering the most familiar things in an oracular way, much as suburbanites compare notes about their astonishing crops. There is nothing of this dry and vain pomposity in the work before us. The writer is a lover of plants and of groups of plants, and has a horror of the results which follow thoughtless planting.

Of course, all such books are likely to cross somebody's prejudices at some unexpected point. Few persons are so intolerant of the views of others as are the enthusiastic owners of small urban or suburban plots of ground devoted to decorative planting. In no occupation does a very little experience count for so much; a single success or a single failure controls the whole subsequent course. Now, as a matter of fact, in no vocation or avocation should a single unrepeated experiment count for so little. Soils, exposures, and the other factors of plant life are so diverse and so difficult to determine for a given case that the beginner is apt to overlook even the most important considerations. The average householder who essays to try his hand at planting around his dwelling, provides himself, first, with half a score of convenient horticultural books, and, finding these somewhat conflicting in their advice, he abandons them, and turns helplessly to the few lines of counsel furnished by the seedmen's catalogues. The brief directions in the latter have the encouraging optimism of patent-medicine almanacs; they are simple, direct, and convincing. Armed with directions designed for the latitude, say, of Boston, the amateur applies to the latitude of Washington the rules as to selection and care, and if his patient plants do not rebel against such unwise treatment, the experiment is reported as a success, and the right to pose ever after as an adviser in horticultural matters is gained. The neighbors of such amateur horticulturists are affected variously by these alleged successes. Some of them weakly copy the arrangements, while others seek to produce effects precisely unlike them. Hence result the kaleidoscopic effects which dazzle us in the environs of our cities. Charles Eliot, in his too brief career, preached the gospel of beauty to the dwellers in our cities and the suburbs. He accomplished much towards replacing formal beds of mismated colors by effective shrubs and commanding trees. No doubt he would have found in the present treatise just the material to recommend to the owners of small places in the vicinity of our cities.

It would not be a difficult task for a resident of our Eastern States to draw from the present work hints for useful combinations, provided due regard be had to the differences in climate. Selection of the more hardy would ensure safety and success. This treatise is, however, something more than a handbook of hints for beginners. It is replete with sound advice in relation to larger subjects, and could judiciously be used by the landscape architect in his interesting work. It may be commended, further, to those who care for such things as winter gardens, pleached alleys, and similar old-fashioned affairs. Matters like the following also find a place: weeping-trees and their uses, trees and shrubs for the sea-coast and for windswept places, for the water-side, and for streets. Many practical matters are touched in a fresh way; for instance, young trees and sunstroke (*i. e.*, of the trees themselves), hardy shrubs in the greenhouse, and the worthy use of roses. In short, all who are interested in the picturesqueness or in the quiet beauty of individual and clustered shrubs and trees, will find in these charming pages much of profit and interest. Moreover, a large part of the information is tabulated in a convenient manner for reference and for comparison.

The unprejudiced reader, after studying these chapters, will agree with the modest and truthful statement of the preface:

"It cannot be urged against this work that it travels along a path already well worn, for the subject of trees and shrubs for English gardens, though almost inexhaustible, has never been so fully treated and illustrated as it deserves. The book may have many defects, but its pages will show that an honest effort has been made to offer helpful and instructive information to the many who wish to know more of the beauty of trees and shrubs."

Daniel Ricketson and his Friends: Letters, Poems, Sketches, etc. Edited by his Daughter and Son, Anna and Walter Ricketson. With illustrations. Boston: Houghton, Mifflin & Co. 1902.

With much commending them to the reader, these memoirs have the prime defect of nowhere giving us in sequence the main facts and incidents of Mr. Ricketson's life. Mr. Sanborn's introductory sketch was written at the time of Mr. Ricketson's death and is dated July 18, 1898, but the day of his friend's death is not given, nor the day of his birth—the year of which, however (1813), can be inferred from various references to his age in Mr. Ricketson's journal and letters. On the other hand, we have his own careful and minute description of his person and character. He concludes that he "never could have passed for aught but an ordinary person," his modest stature, five feet three inches, being in harmony with such a view. Though quickly moved to sympathy with human or brute suffering, he did not consider himself "a particularly liberal or open-handed man." Many aspects of his mind and character, as revealed by his letters and journals, are interesting. He was a diligent reader and writer, in love with the world out of doors, observant, but in no wide or penetrating manner; Cowper his favorite author. He aspired to live the simple life, but with some qualifications: he liked the best English editions of his favorite books in fine bindings. Aspiring to the stoicism of Emerson, he fell far short of it, complaining of his health to a degree that Emerson would have thought felonious, and being very easily put out of mental equilibrium. He wrote a great deal of verse, but not much poetry. The concluding section of the book has numerous examples, several of them long drawn out. They have much sincerity contending with the artificiality of the literary amateur.

The best use of this book should be to encourage the average man to live more with nature and with books, but its main effect will probably be to add something to that stock of impressions of the Concord coterie which is in little need of further aggregation. Mr. Ricketson's sketches of Emerson, Alcott, Channing, Thoreau are better than many we have had heretofore, yet not equal to the best. He is no fulsome flatterer, finding Emerson's quality "less great and strong than good," and him "a recipient of the divine cordial in doses rather homœopathic." His relation to Thoreau, also, seems to have been less abject than that of some others. He accounted himself a less docile disciple than Blake and Brown.

But Thoreau is the hero of these pages who crowds all the others from their seats. First we have a sketch of him by Mr. Ricketson, then the correspondence of these two, then Sophie Thoreau's correspondence with Mr. Ricketson about her brother, then several other sets of letters to and from Thoreau's friends and admirers, including his English biographer, Henry S. Salt. Mr. Ricketson's acquaintance with Thoreau began in 1854 and continued till Thoreau's death in 1862. In the course of this period they visited each other many times and wrote each other with irregular infrequency. There is a pathetic letter of Ricketson's complaining of Thoreau's long silence, and Thoreau's elaborate reply, which

is hardly an apology: "This life is not for complaint but for satisfaction. I do not feel addressed by this letter of yours. It suggests only misunderstanding. Intercourse may be good, but of what use are complaints and apologies?" Our best glimpses of Thoreau are in his sister's letters. It is interesting to find her saving from Emerson's pruning hand some flowers of sentiment in Thoreau's published letters. As compared with his friend W. E. Channing, Thoreau was perfectly accessible. It is no wonder that Mr. Ricketson was disappointed in Thoreau's appearance if his sketch of him, here reproduced, was true to life. The portrait of Thoreau from the Ricketson photograph is quite different from the engraving based on it in Sanborn's 'Henry D. Thoreau,' and has no trace of the likeness to Emerson which is aggressive in the Rowse portrait of Thoreau. The three portraits of Mr. Ricketson are interesting, but far less so than two of his wife, one when she was twenty, and one when she was thirty-seven years old. We might well have been told more of one who was so beautiful.

The New Harmony Communities. By George Browning Lockwood. Marion, Ind.: The Chronicle Co. 1902. Pp. 282.

Nothing passes for being more like a last year's bird's-nest than an old newspaper, and yet the present picture of New Harmony, which gave promise of discoursing divine music, is an attractive mosaic tesselated preëminently from the New Harmony *Gazette*—a rare relic which the author made a pilgrimage to see and study on the very spot of its publication, not knowing probably where else it could be ferreted out. This weekly had pages of the same size as the *Nation*, nearly as many and as well printed. Its first issue was within six months after Owenites had stepped into the places of Rappites. Thanks to Paul Brown—a Paul Pry into true inwardness, who had entered the camp of Owen, and who printed as sarcastically as Diogenes was wont to speak—the paper betrays much to one who reads between the lines. From the first we see worms sapping all unseen at the root. In the track of such a leader, those at first timid became outspoken, nothing could be suppressed, and the journal unawares grew a source-book of local history, one doubly precious to Mr. Lockwood because unknown to or unheeded by previous writers.

Robert Owen first came to New Harmony in the spring of 1825, having already, through an agent, bought the whole settlement *en bloc* for $150,000. This establishment, founded by Rapp, had for ten years been the prosperous home of a thousand of his flock. These at once departed on steamboats, leaving the coast clear to the purchaser, who on May Day began to install his disciples there, repeating the occupation of the land of promise by Jews. After one single month of arranging the details of the Far West experiment, he left it in charge of deputies, on July 17 sailed from New York for England, and saw no more of his plantation until the following January. His preliminary constitution for a "community of equality," which he then at once brought forward, was, after discussion, adopted on February 5th. The dissenters, however, formed so large a minority of non-equalitarians that two offshoots sprouted out from the original stock and settled apart, divided further by mutual contempt than by distance. Still, all agreed on inviting Owen to continue in autocratic power, which he did. His address in the Hall on the 9th of May showed, with counsels of perfection, hopefulness on his part among a crowd who were already doubtful if not despairing. A year passed on, and his disappointments had been so vast that he bade farewell to that Harmony which had proved so discordant after his utmost endeavors and the outlay of $200,000, or much more than the half of all his fortune. But he went away whistling to keep his courage up and if possible that of his votaries. Returning within a year and for the last time, his optimism failed in the face of a complete collapse of the social aggregation.

Many secondary causes of Owen's discomfiture are obvious and have been often set forth as beacon lights to warn against breakers; but the cardinal cause was rather moral than physical. The contrast between stolid Rappites and wide-awake Owenites was, after all, in this most striking, that one sect was religious throughout, and the other was not. Rapp had powers not of this world to unify and stimulate his operatives. Lack of this to cast out the devils of laziness and licentiousness left Owen's multitude, who flocked around him for loaves and fishes, a veritable rope of sand whenever combined or distasteful toil was needed. When Owen had impoverished himself, as a good Samaritan, and could no longer grant physical help, his moral endeavors never flagged. Each year of American struggle was followed by as earnest a decade in Europe, and he died well-nigh a nonagenarian, but a philanthropist to the last. The seed he sowed has brought forth a hundredfold, as Mr. Lockwood shows, in more than one harvest.

French Cathedrals and Châteaux. By Clara Crawford Perkins. 2 vols., pp. viii., 284, and x., 299. Boston: Knight & Millet. 1903.

This popular book, of easy reading, with many unrelated details in the body of it, begins with some preparatory essays which may be thought to have received much care in their preparation. The tone of criticism, indeed, may be exemplified by the quotation from Robert Louis Stevenson of the passage where he becomes enthusiastic over cathedrals, page xvi., but that casual sort of estimation is in a way contradicted by the serious attempts at historical, constructional, and artistic study which follow. Chapter one is devoted to France of the Franks; chapters two and three are devoted to Gothic building; chapter four is devoted to Gothic windows, "glass and tracery"; chapter five is devoted to Gothic sculpture, and chapter six contains an historical outline. In all of these there is noticeable a constant reference to good authorities, and, mixed with these, reference to writers who have left sayings behind them—sayings which neither pretended to have nor can have any authority at all. Apparently there is no pretence on the author's part to any positive knowledge or strongly held opinions. It is, however, a recognized fact that the second-hand or third-hand knowledge and the not too strongly held opinions meet a popular demand, and that they are generally considered much more readable than the work of the scholar or of the critic.

Following these introductory chapters in volume one, are notices of seven of the great cathedrals of Northern France and three or four Gothic buildings which are not cathedrals. Viollet-le-Duc and Professor Moore of Harvard University, the two best known writers on Gothic art as a general subject of inquiry—good and trustworthy writers, too—are continually referred to. It is odd to see the two names turning up in one sentence or in two succeeding sentences so frequently. Ruskin's vague enthusiasm and his ill-aimed criticism are also constantly in evidence.

Volume two, being devoted to châteaux, is devoted also to the Renaissance. It opens with a very brief essay on the Renaissance in general, as seen in France, but this takes up only nine pages, and then follow chapters on the late Gothic strong castles of Pierrefonds and Loches and the Renaissance manor-houses of Langeais, Chaumont, and the other famous ones, alternating with the royal establishments of Fontainebleau, Versailles, and in Paris the Louvre and Tuileries. The characteristics of volume one are traceable again in volume two. A good instance of what has been named above as the writer's tentative way of going to work where the opinions of a well-chosen writer are compared with other and less important views, is in the note on page 10, where there is question of historical accuracy in Viollet-le-Duc's restoration of Pierrefonds. The accusations brought against the famous architect are not rightly seized, nor are the strongest points of his defence presented. It is rather fortunate that the writer has been so generally careful in avoiding statements of positive opinion, for she thinks that there is a mingling of Gothic with Renaissance art in Chambord, and asserts, apparently on her own authority, that the roof which crowns the walls of Chambord "is Gothic run riot," although it appears in the next sentence that its details "are loaded with heavy and coarse Renaissance ornaments." The illustrations are photographic views of the important buildings named; thirty-two of them devoted to the Gothic churches and as many to the fortresses and the neo-classic buildings of the second volume. They are generally reproductions of the more familiar photographs.

Vus du Dehors. Par Max Nordau. Paris: Alcan. 1903.

The admission of a volume to the series entitled "Bibliothèque de Philosophie Contemporaine" is a virtual pledge to its readers of a certain measure of dignified scientific objectivity in discussing questions of moment, particularly if occurring in the work of men whom the competent critics of their own race and speech unite in honoring. To expect uniform sedateness of deliberative opinion from the author of 'Degeneration' would, however, be a naïve proceeding. Yet Dr. Nordau, in his brief prefatory note to this collection of review articles on contemporary French writers, contends that the mere condition of being an outsider insures serenity to his conclusions through the negative influence of detachment from coteries and freedom from

local bias. This attempted analogy between contemporary foreign judgments and the final verdicts of posterity is radically misleading. In the present condition of international relations, is it conceivable that the literature and art of any flourishing country can be contemplated dispassionately by rivals? So far is this from being the case that the louder the professions of critical aloofness on the part of a foreign censor, the more alert should our suspicion be lest they cover sly attack or disparagement. The essays in question, which discuss novelists, poets, and playwrights with somewhat obtrusive pretensions to "scientific and philosophical criticism," are mostly occupied with the demolishing of established reputations, accompanied here and there by suggestions as to the superior genuineness of the corresponding article of Teutonic make. There is also the familiar turn for occasionally entertaining paradox (always deadly in earnest), and a dreary parade of scientific method and terms suggestive of formal lectures in morbid psychology.

The arbitrariness of Dr. Nordau's classifications appears in his promptly ranking Michelet among the *romanciers*. It is, from one point of view, indeed unfortunate that Michelet could never be dull; but does it follow that the only admissible conception of history belongs to those of whom it is here said (p. 13), "La chose importante pour eux, ce sont les recherches, ce n'est pas le récit. Les notes au bas des pages ont à leurs yeux plus de valeur que le texte"? And the same confusion in the use of terms of no doubtful connotation occurs in the elaborate endeavor to prove that Balzac was no realist—this, of the author of 'Le Curé de Tours,' the delineator of the 'Maison Vauquer.' That Balzac as a student of character applied to the full his marvellous power as a *voyant*, no one will deny; but the interpretations of human nature at which he arrived, proceeded from a minute daily observation as rigorous and painstaking as that of any inductive inquirer into the facts out of which he constructs his comprehensive theory. Precisely in the same spirit of one-sided appreciation, Dr. Nordau considers Maupassant as having shown from beginning to end of his career an exclusive maniacal predisposition for "un érotisme profondément pathologique," with at the same time a sharp eye for external detail, a combination rendering his work valuable not to the philosopher or the moralist, but to the alienist. What aptitude the last may possess for fine analytical discrimination, may be guessed from the juxtaposition, in an essay entitled "Trois Études de la Jalousie," of an incongruous trio named respectively Shakspere, Anatole France, and Lucien Mühlfeld.

We may pass over with the briefest mention three studies dealing with the still more perilously debatable ground of modern French poetry, entire comprehension of which demands somewhat more than the training of a scientific mind and a linguistic equipment sufficient for the grasping of a direct meaning. Mallarmé's enigmatic utterances (which we make no profession of either explaining or enjoying) are just the kind which the foreigner is only too disposed to hail with rapture or to sniff at with contempt. As Dr. Nordau prefers the latter course, we may well ask him what he would say of a French critic who should follow the same method in disposing of 'Atta Troll.'

More than half of the volume is occupied with reviews of contemporary dramatists, from Dumas *fils* to Rostand, special attention being paid to the moral problems raised in their various dramas. On the comedy of pure fun, illustrated in the work of Labiche, or of light and brilliant social satire such as 'Le Monde ou l'on s'ennuie,' Dr. Nordau has no word to cast away; his concern is with playwrights who take themselves and their dramas in a spirit of moral gravity, and, as it were, pontify through the lips of their fictitious characters. In this connection, the younger Dumas stands, in his critic's eyes, for nothing more than the oracular mouthpiece of commonplace sentiment or opinion ("des solutions appartenant déjà au fonds immuable des tartiniers en chef du *Petit Journal*"), while the whole of his dramatic work is a special pleading on the issues involved in the playwright's equivocal position toward his own parents and society at large. Does "L'Ami des Femmes" bear directly on any phase of Dumas's life?

Examination of Brieux's plays offers an opportunity for a wholly irrelevant and digressional attack on M. Brunetière's sensational article of a few years ago, which impugned the pretensions of some scientific men by charging science in general with failure to carry out the rash prophecies of votaries. Theologians, says Dr. Nordau, had long before uttered the same sort of fulmination, which their obvious *intérêt de boutique* prevented scientific men from wasting time in refuting. But scorn and sarcasm are no reply. If Dr. Nordau, like the majority of his compeers who broke lances with M. Brunetière at the time, chooses to shirk the vital issue at stake by declaring that science is too much concerned with "serious questions" to pay heed to such trivial topics as the First Cause, the origin of evil, and the possibility of conscious existence after death, he and his ilk have still before them the hardest task of all, namely, that of diverting the oldest and strongest of intellectual instincts from the most permanently engrossing of all problems.

BOOKS OF THE WEEK.

Augustin-Thierry, Gilbert. Conspirateurs et Gens de Police. Paris: Armand Colin. 3 fr. 50.
Baker, Harold. The Collegiate Church of Stratford-on-Avon, and Other Buildings of Interest in the Town and Neighborhood. (Bell's Cathedral Series.) London: George Bell & Sons; New York: Macmillan. 60 cents.
Balch, T. W. Emériс Crusé. Philadelphia: Allen, Lane & Scott.
Brown, Alice. The Mannerings. Houghton, Mifflin & Co. $1.50.
Buck, J. H. Old Plate: Its Makers and Marks. The Gorham Mfg. Co.
Burgess, E. S. History of Pre-Clusian Botany in its Relation to Aster. (Memoirs of the Torrey Botanical Club, Vol. X.). New York: Published by the Torrey Botanical Club.
Cook, Prof. A. S. Biblical Quotations in Old English Prose Writers, Second Series. (Yale Bicentennial Publications.) London: Edward Arnold; New York: Scribner's.
Cook, E. T. A Popular Handbook to the Greek and Roman Antiquities in the British Museum. Macmillan. $3.25.
Cook, G. C. Roderick Taliaferro. Macmillan.
Dubnow, S. M. Jewish History. Philadelphia: Jewish Publication Society.
Galdós, B. P. Marianela. Translated by J. Geddes and F. M. Josselyn. Boston: D. C. Heath & Co.
Gerrare, Wirt. Greater Russia, the Continental Empire of the Old World. Macmillan.
Griffis, W. E. Young People's History of Holland. Houghton, Mifflin & Co. $1.50.
Haldane, R. B. The Pathway to Reality. E. P. Dutton & Co. $3.
Hall, W. S. Descriptive Geometry. With portfolio of plates. D. Van Nostrand Co. $3.50.
Helps, Arthur. The Spanish Conquest in America. Vol. III. New ed. Edited by M. Oppenheim. John Lane.
Heysinger, I. W. The Light of China. Philadelphia: Research Pub. Co.
Hiatt, Charles. Notre Dame de Paris. (Bell's Handbook to Continental Churches.) London: George Bell & Sons; New York: Macmillan. $1.
Jones, J. P. India's Problem: Krishna or Christ? Fleming H. Revell & Co. $1.50.

The Nation says:

"We are not dependent upon plot . . . we are only too well satisfied to go on with such delightful people, and especially through such delightful scenes, on any terms. . . . This is old ground, but the unusual method of locomotion and a fresh touch give it a new and living interest. . . . A light, graceful, accurate mention devoted to some places and very satisfactory fulness to others. . . . It should be a good practical guide, too, to those about to go over the same course, while its charming descriptions of travel afford an ample new fund of pleasure, tinged with envy here and there to the stay-at-homes."

Gordy's Language Lesson
(A First Book in English)
Burt's The Literary Primer
James's Government in State and Nation
Gordy's American Leaders and Heroes
Gordy's United States History
Ashton's Plane and Spherical Trigonometry
Miller's Elementary Physics

A Sufficient Reason in One Sentence

GORDY'S LANGUAGE LESSONS are the simplest, straightest paths to writing, speaking and knowing our English language.

BURT'S THE LITERARY PRIMER is based upon word-getting, teaching of sounds, repetition of vocabulary, child's own activities and contact with permanent literature.

JAMES'S GOVERNMENT IN STATE AND NATION brings pupil face-to-face with government *as it really operates* and conditions as they really exist.

GORDY'S AMERICAN LEADERS AND HEROES makes the personal character of our great men stand out clear as crystal in an epoch or crisis and the beginning child learns that history is the record of human life.

GORDY'S HISTORY OF THE UNITED STATES was written by a *Grammar School Master*, and that is a great distinction nowadays.

ASHTON'S TRIGONOMETRY moves in a direct line to the solution of triangles.

MILLER'S ELEMENTARY PHYSICS *is* elementary, and the experiments *are* the bases of the text.

FERRIS & LEACH, Publishers, Nos. 29-31 North Seventh Street, PHILADELPHIA.

NEWEST AND BEST TEXT-BOOKS

Hill's Beginnings of Rhetoric and Composition..... $1.25

By Adams Sherman Hill, Boylston Professor of Rhetoric and Oratory, Harvard University.

This book is intended to teach young writers to express themselves correctly; not by dry mechanical devices, but by stimulating them to put their natural selves into their compositions. It lays emphasis on correct rather than on incorrect forms, and on better rather than on worse methods of expression. Numerous practical exercises are given on every important point, sufficiently varied for the most pains-taking teacher.

Kutner's Commercial German $1.00.

By Arnold Kutner, High School of Commerce, New York City.

A complete course in German for commercial students, furnishing much information which will be useful in business life. It is the first attempt to introduce American students to a foreign language by means of its commercial vocabulary, and contains not only the elements of commercial German, but also reading lessons, grammatical tables, exercises on Grammar and reading selections dealing with German business customs and institutions. Special attention is given to the study of commercial correspondence, business forms, documents, newspaper articles, and advertisements.

Wolfson's Essentials in Ancient History $1.50

By Arthur Mayer Wolfson, Ph.D., Assistant in History, De Witt Clinton High School, New York; in consultation with Albert Bushnell Hart, LL.D., Harvard University.

Prepared on the plan recommended by the Committee of Seven, this book meets satisfactorily the most exacting college entrance requirements in History, and combines in one volume Greek and Roman history, with that of the Western nations. The work covers one school year. The illustrations, the list of topics for research, and the bibliographies of parallel reading, deserve special mention.

Francois's Advanced French Prose Composition..... $0.80

By Victor E. Francois, Instructor in French in the University of Michigan.

This book for the third and fourth years in high schools or for the second year in colleges, can be used with any complete grammar. Part I. includes rules of grammar for review, a list of verbs with the required preposition, a variety of French texts, work in transposition etc.; Part II. on the other hand, has an interesting subject—"A Stranger Visiting Paris," upon which are based numerous French and English passages for translation, some of which are original, while others have been borrowed from notable French writers.

In Press and in Preparation

THE GATEWAY SERIES OF ENGLISH TEXTS. For admission to colleges. Edited under the general supervision of Henry Van Dyke. Professor of English Literature, Princeton University.

MORRIS AND MORGAN'S LATIN SERIES for Schools and Colleges. Prepared under the editorial supervision of Edward P. Morris, A.M., Professor of Latin, Yale University, and Morris H. Morgan, Ph.D., Professor of Classical Philology, Harvard University.

A GREEK SERIES FOR COLLEGES AND SCHOOLS. Edited under the supervision of Herbert Weir Smyth, Ph.D., Eliot Professor of Greek Literature, Harvard University.

New Catalogue for 1903

The American Book Company's new Descriptive Catalogue of High School and College Text-Books is now ready for distribution. For the convenience of teachers, separate Catalogues have been issued containing the newest and best books in the various branches of study. Copies will be sent to any address on request.

Modern Language Texts

The Modern Language Texts in French, German, and Spanish now issued by the American Book Company are noteworthy for their suitability for use in both secondary schools and colleges. In addition to grammars, lesson books, and reading books, there are now published twenty-five different French texts and forty German texts, nearly all of which are edited with notes and vocabulary. For the most part they follow the lines laid down and recommended in the Report of the Committee of Twelve of the Modern Language Association of America. New volumes are constantly being added to this series.

FRIEZE'S VIRGIL'S AENEID—REVISED EDITION. First Six Books, $1.30. Complete..... $1.50

Revised by Walter Dennison, Professor of Latin in the University of Michigan.

HARKNESS AND FORBES'S CAESAR'S GALLIC WAR. $1.25

By Albert Harkness, Ph.D., LL.D., Assisted by Charles H. Forbes, Professor of Latin, Phillips Academy.

BABBITT'S GRAMMAR OF ATTIC AND IONIC GREEK $1.50

By Frank Cole Babbitt, Ph.D. (Harvard), Professor of the Greek Language and Literature, Trinity College, Hartford.

FLAGG'S A WRITER OF ATTIC PROSE..... $1.00

By Isaac Flagg, Professor of Greek in the University of California.

MOORE'S HORACE. ODES, EPODES, AND CARMEN SAECULARE..... $1.50

Edited by Clifford Herschel Moore, Assistant Professor of Latin and Greek, Harvard University.

PRICE'S CICERO'S LAELIUS DE AMICITIA..... $0.75

Edited by Clifton Price, Ph.D., Instructor in Latin in the University of California.

BEVIER'S BRIEF GREEK SYNTAX..... $0.90

By Louis Bevier, Jr., Ph. D., Professor of the Greek Language and Literature in Rutgers College.

Publishers *J. B. Lippincott Company* *Philadelphia*

American Literature
BY
J. W. ABERNETHY, Ph.D.
Principal of Berkeley Institute, Brooklyn, N. Y.
FULLY ILLUSTRATED
510 Pages. 12mo, Cloth. Introductory Price, $1.10.

SAMUEL THURBER, Master in Girls' High School, Boston: To take such a book in hand, to give it a thorough sampling, and to note its method and its style is indeed worth while. This appears to me to be the best book I know for the special study of American Literature.—*April 21, 1902.*

EDWARD R. SHAW, Ph.D., Dean of the Faculty of Pedagogy, New York University, New York: The book is most delightful reading. It is a careful, scholarly, and brilliant piece of work, and shows years of close study of the whole field of which it treats. A large success awaits it.—*May 31, 1902.*

One of the most interesting features of the book is the supplementing of the author's critical estimates of the value of the work of the more important American writers with opinions quoted from contemporary sources. Other strong points are the attention given to more recent contributions to American literature, and the fact that Southern literature is accorded a consideration commensurate with its interest and value.

The pedagogical merit of the book is indicated by the care which has been given to the production of a teaching apparatus which is at once simple and entirely adequate.

GANOT'S PHYSICS

SIXTEENTH EDITION.

REVISED AND IMPROVED.

BY

A. W. REINOLD, M.A., F.R.S.

Professor of Physics, Royal Naval College, Greenwich, England.

A General Elementary Treatise on Physics, surpassing all previous Editions.

William Wood & Co.

51 FIFTH AVENUE, NEW YORK

THE SILVER SERIES OF Modern Language Text-Books

Under the Editorial Direction of Adolphe Cohn, LL.B., A.M., Professor of the Romance Languages and Literatures in Columbia University.

A SYSTEMATIC, comprehensive and rapidly expanding series of grammars, texts and other works for the study of French, German, Italian and Spanish. Distinctive for its unity of plan, the representative character of its editors, the careful selection of its texts, and attention to typography, printing and binding.

An Elementary French Reader. Douay. *Washington University.* $1.00.
Thiers' **La Campagne de Waterloo.** Super. *Dickinson College.* 40 cents.
France's **Monsieur Bergeret.** Dike. *Mass. Institute of Technology.* $1.00.
Corneille's **Le Menteur.** Segall. *College of the City of New York.* 40 cents.
An Elementary Grammar of the Spanish Language. Loiseaux. *Columbia University.* 90 cents.
An Elementary Spanish Reader. Loiseaux. *Columbia University.* 90 cents.
A Spanish Anthology. Ford *Harvard University.* $1.25.
Carrión and Aza's **Zaragüeta.** Howland. *University of Chicago.* 50 cents.
Manzoni's **I Promessi Sposi.** Levi. *University of Michigan.* $1.20.
An Elementary German Reader. Lutz. *Albion College.* $1.00.
Germany and the Germans. Lodeman. *State Normal College, Michigan.* 60 cents.
Heyse's **Unter Brüdern.** Keppler. *Columbia University.* 30 cents.
Schiller's **Die Brant von Messina.** Carruth. *University of Kansas.* 60 cents.

NOTABLE AMONG NEW BOOKS

THE BEST GARDEN BOOKS

THIRD EDITION

A Woman's Hardy Garden

By HELENA RUTHERFURD ELY

Published Feb. 14. Illustrated, cloth, $1.75 *net.* (Postage 13c.)

"Really practical directions for making a charming but not too ambitious flower garden . . . a book to be welcomed with enthusiasm."—*The New York Tribune.*

FIFTH EDITION

The Garden of a Commuter's Wife

RECORDED BY THE GARDENER.

Illustrated, Cloth, $1.50.

"It breathes an air of cheery companionship, of flowers, birds, all nature and the warm affection of human friendship, wholesome, unselfish and kindly." —*Chicago Post.*

Garden Making

Suggestions for the Utilizing of Home Grounds,

By L. H. BAILEY, *Cornell University.*

Fifth Edition. 256 illustrations. Cloth, $1.00.

"Eminently practical, scientifically accurate, and at the same time racily interesting."—*Nature Notes, London.*

The Practical Garden-Book

The Simplest Directions for the Growing of the Commonest Things about the House and Garden.

By L. H. BAILEY, *Cornell University.*

Second Edition. Illustrated with many marginal cuts. $1.00.

"A hand-book which every one must find most practical, whether his garden be of acres or occupy only a window-box or a tomato-can." It is trustworthy and specific.

Send for a circular descriptive of the above, and many other books of interest to the lover of nature.

THE LATEST FICTION

Published this Week.

Mr. BRADLEY GILMAN'S

Ronald Carnaquay

A COMMERCIAL CLERGYMAN

is a decidedly clever, strong and humorous new novel, especially interesting to members of any "progressive" church. *Cloth, 12mo, $1.50.*

Mr. GEORGE CRAM COOK'S *Novel*

Roderick Taliaferro

A STORY OF MAXIMILIAN'S EMPIRE

is a book likely to win a host of friends . . . a good love story, which will be simply and frankly enjoyed."—*Commercial Advertiser, N. Y.*

Illustrated by SEYMOUR M. STONE. *Cloth, 12mo, $1.50.*

MR. PAUL GWYNNE'S *Novel*

The Pagan at the Shrine

A story of the South of Spain during the Carlist troubles and the anti-Jesuit agitations. An intensely human, daring story of warring passions, by the author of "Marta." *Cloth, 12mo, $1.50*

Mr. LAWSON'S *New Novel*

From the Unvarying Star

is "a prose poem, touched with beauty, ideality, and suffused with a delightful atmosphere."—*Boston Herald.*

Cloth, 12mo, $1.50

Mr. PERCY MACKAYE'S *Play*

The Canterbury Pilgrims

is a daring scheme carried out in so original a way that its production will be undertaken by Mr. E. H. Sothern. In this bright comedy Chaucer appears in the rôle of a lover. *Cloth, 16mo, $1.25 net.*

(Postage 10 cents.)

The Nation.

NEW YORK, THURSDAY, APRIL 9, 1903.

The Week.

President Roosevelt's speech on the Trusts betrays a dawning consciousness that the time for platitudes has passed and the hour of practical action arrived. He has got his anti-Trust legislation, now what is he going to do with it? The affair is in his own hands. His new Bureau of Corporations can be rendered an efficient instrument for securing publicity if he wishes to make it such. On this subject he does not indulge very bold promises. We must be patient. Organization of the new department will be necessarily slow, and its first activities tentative. Undoubtedly; but what are we to say of the President's flat declaration that further legislation is "impracticable"? That is to discredit in advance the very law of which he is boasting, for an essential part of it is its plan to gather "such information and data as will enable the President of the United States to make recommendations to Congress for the regulation of such commerce, etc." Yet here is Mr. Roosevelt practically notifying his Commissioner of Corporations that he wants no such information, and will make no use of it if he gets it.

In the same breath with his intimation that he means to make a very polite and lady-like use of the weapon against Trusts which Congress gave him, Mr. Roosevelt announces that he will not touch the really deadly weapon of tariff revision. As far as he is concerned, the tariff-protected Trusts may continue to hide behind the Dingley law, and utilize its aid in preying upon the consumer. The President is not willing to go even as far as Secretary Root, and admit the possible need of legislation to prevent the tariff from being abused by Trusts, and to compel them to sell their goods at home as cheaply as abroad—or, at any rate, at a "fair" price. Mr. Roosevelt pushes all this away, with schoolboy cock-sureness, as a plan for "putting an end to the prosperity of the country." Congressman Babcock is nearer right. He declared on Friday that the next Congress is "pledged to a revision of the tariff," and that, but for such a pledge, the Republicans would have lost their majority. Now Babcock personally does not count. He ran away like a frightened hare last winter, when courage and backbone on his part would have forced tariff revision to the front, and he will doubtless do so again. But he clearly states the situation. His forecast of an immense lift to the Democratic party by means of the tariff issue, if the Republicans show that they are unwilling or unable to correct the flagrant injustice of the existing law, is only that of thousands of Republicans. President Roosevelt's friends say that he has shrewdly stolen the Trust issue from the Democrats. But if he hands them over the tariff issue, he will be profited nothing; and all that he says about Trusts will be only as so much water for the Democratic mill.

The Trades Assembly of Kansas City petitions President Roosevelt, in his present tour, to boycott the Union Pacific Railway, which has recently put certain of its machinists on piece work. While the President's enthusiasm for organized labor is well known, it is probable that he will hold to his original itinerary. To do otherwise might subject him to some inconvenience. Other railways beside the Union Pacific may fall under the ban; hotels, too, are subject to boycott by various unions, even private citizens in the West may suddenly be declared "unfair," now that janitors and other domestic servants are unionized. In fact, if Mr. Roosevelt attempted to travel respecting everywhere this peculiar form of tabu, his course would inevitably recall that childish game the skill of which lay in not stepping on the spots in the carpet. But the President has had the boycott at home, in the case of rival painters' unions in the White House, and knows very well that such nonsense as the Kansas City resolution is frequently perpetrated merely to advertise the union—a fact which critics of the eccentricities of unionism must not forget.

The exordium of Secretary Root's address before the Home Market Club at Boston last week was a laudation of the brute majority. Glancing at the pitiful minority that wishes the tariff revised, he reminded us that there are some—one in a hundred perhaps—who are always in opposition. He warns everybody not to imagine that "their loud cries of dissent indicate public judgment." Still flouting "this useful but trying class of our fellow-citizens," he finds that they have recently and capriciously turned against the protective system, but "if we had been a free-trade country they would have been protectionists." This persiflage at the expense of minorities would be much more effective in another mouth than Mr. Root's. He has not hesitated, on occasion, to join that "useful but trying class" which dares to speak its mind against majorities and foregone conclusions. We take pleasure in reprinting words spoken by Mr. Root at the Carnegie Hall meeting, held December 23, 1896, in favor of Mr. Choate's candidacy for the Senate. If ever there was a forlorn hope, it was the attempt to force Mr. Choate upon the Platt machine at Albany. Mr. Root, however, rejoicing in the very difficulty of the endeavor, said:

> "Our voice in this great contest is but the voice of one crying in the wilderness. Members of the Legislature are elected; they are about to take their places; they are about to declare their choice. But one thing we can do. We can say loudly what we think it is the duty of the State of New York to do. . . . Far distant be the day when the people assent to the proposition that, under any circumstances whatever, it is an impertinence for any citizen, however humble he may be, however few they may be who agree with him, to express to his representatives his sentiments and wishes regarding their action."

It is a greatly changed Mr. Root who to-day has an ironical sneer for such as waste their voices in the wilderness. He now professes the creed of things as they are, and, very skilfully showing the enormous difficulties that tariff revision involves, he assumes that nothing can be done for the present. He even lays down maxims on the convenient season for revision, which he admits as a theoretical possibility: (1) No change of the schedule must be undertaken while a Presidential campaign is impending. In other words, not this year or next. (2) The tariff should be revised by its friends. But since its friends clearly dislike to revise it, it should and will remain unrevised, maugre the cries of a factious minority. We have no other comment to make on this facile sort of prediction than to say that Mr. Root assumes the prophetic air in tariff matters with singular ill grace. Congress threw back his Cuban tariff bill in his face, and mangled his Philippine schedules out of all recognition. Had he followed his own teachings, he would have realized that the immutability of the Dingley schedules is hard fact, and would have saved his official shins.

An unpleasant impression is certainly made by the correspondence between President Roosevelt and ex-Senator Simon of Oregon. It is not simply that the President appears to have impetuously promised an appointment which he strangely forgot to make, but that he so ostentatiously puts his neck in the yoke held out to him by the Senate. "They [the two Senators from Oregon] *cannot consent*," he writes, "to Mr. Steele's receiving the appointment which I had designed to give him. . . . I very much regret to say that it would, of course, be useless to send it in." This it is to be a Constitutional President! Like Ormuzd, Mr. Roosevelt would be glad to have his good way, but the Senate Ahriman will not let him. One is reminded of Macaulay's attempt to explain the existence of evil by contending that the Ruler of the Universe

was limited by the fixed decrees of fate. When this was reported to Dr. Thompson, Master of Trinity, he remarked, "What a thoroughly Whig doctrine—a Constitutional God!"

Peculiar interest attached to the Ohio municipal elections on Monday. They were the first held under the new general law determining the form of the government of cities throughout the State, and were expected, besides, to throw considerable light on the political drift. The result, as between parties, is something like a stand-off. In Cincinnati the Republicans won by an unexpectedly large majority, while the Democrats, under the leadership of Mayor Johnson, strengthened their hold upon the city of Cleveland, now the largest in Ohio. The latter event will be peculiarly galling to the Republicans, and especially to Senator Hanna. He had united all factions of his party in a determined effort to make an end of Johnson, but is worse beaten than before. His local prestige has thus had a rude buffet, and his hold on the State machine must be somewhat weakened. He had a candidate for Governor in the background, Mr. Myron T. Herrick of Cleveland, who will now be at liberty to give his undivided attention to business, and let politics go.

The reëlection of Mayor Jones of Toledo is, politically, most amazing. He proclaimed himself a "Man without a Party." He had no organization, no "workers," no newspapers. The city press ignored him. The two parties had each their candidate, for whom an active campaign was made. Yet the ridiculed Jones came out with as many votes as his two rivals had together. This repeated success of one who has some grotesque characteristics, yet who has evidently impressed himself on his fellow-citizens as an honest man, without the fear of a boss or a machine before his eyes, is more than a passing curiosity. It has a lesson for politicians, as well as for those ambitious to serve the public, if they would but read it. As for the overwhelming defeat of Mr. Ingalls in Cincinnati, he apparently suffered from too much thundering in the index. His programme was a little too ostentatiously marked out in advance—Mayor in April, Governor next November, President in 1904. These are the successive rounds of the ladder by which many a man has attempted to mount ever since Mr. Cleveland showed how easily it might be done. But, thus far, every one who has essayed to imitate him has fallen with a crash. History does not repeat itself except in exposing the folly of those who think it will. We had better pick out our Mayors without hoping that they may prove Governors or Presidents.

When Judge Adams granted a temporary injunction against a strike of the trainmen and firemen of the Wabash Railway, there was general acquiescence in it both by the parties concerned and by public opinion. It was understood, however, that there was no process of law by which men could be held to service and labor without their consent. It was proper that the situation should be cleared, that irreparable damage should be prevented, and that the people served by the railroads, to whom the movement of trains was indispensable, should not be deprived of it without notice; but, of course, if the men were determined to quit work they could not be prevented from doing so in an orderly way. So the Judge has dissolved the injunction in terms as dignified as those in which he granted it. He finds that the employees of the road were not engaged in an unlawful conspiracy, that they were not acting under coercion in making their demand for an increase of wages, and that they were exercising their undoubted rights as citizens. As they have the right to make the demand, they may strike if the demand is not complied with, but the strike must not be attended with violence or the destruction of property, or by coercive measures to prevent the railroad company from employing other help to move its trains. In conclusion, the Judge expresses the hope that the men and the company will submit their conflicting claims to arbitration if they are unable to come to an agreement otherwise. There is fair prospect that such an agreement may be reached.

In the year 1891, organized labor procured the passage of a law by the Legislature of Indiana fixing the minimum wages of unskilled laborers employed by counties, cities, and towns at 20 cents an hour. The Supreme Court of the State has just decided that the act is unconstitutional, since it deprives the counties, cities, and towns of freedom to make contracts. If the Legislature can fix a minimum wage, says the court, it can fix a maximum. It holds, moreover, that this is class legislation, fixing, perhaps, higher pay for laborers in public employment than for persons doing the same work for private persons. It is quite conceivable that two men might be at work side by side building roads, one for the county at 20 cents per hour, and the other for a trolley company at half the price. The theory of the promoters of the law is, that if they can compel the county to pay 20 cents, the men who are working for private parties will refuse to work for less, and thus the whole scale of wages will be raised. But it is clear that they will have to work on some other plan than this, since liberty of contract cannot be denied to public corporations any more than to private ones.

A Rutland jury has awarded $2,500 damages to a local manufacturing company which brought suit against a labor organization. More than one hundred members of the union were made defendants in the action, and their individual property holdings were attached. The suit was the result of a strike, and on the trial the company showed that it had been substantially injured by unlawful acts of the strikers. It was prevented in many cases by intimidation on the part of members of the labor organization from employing non-union men. Those whom it succeeded in employing were excluded from boarding-houses, owing to threats of the strikers, and had to be provided for by the company. Besides this, private detectives and watchmen had to guard its property. The interesting point of the decision is that the individual members of the organization, upon whom service was secured, are held personally liable, and the damages awarded must be paid from their property, which has been attached. Whether or not the union itself owns any property is therefore of no importance. This is an indirect, but in Vermont at least an apparently effective, means of establishing responsibility on the part of labor unions. If the verdict is upheld, such organizations in Vermont will no longer be able to engage in boycotts, intimidation, and violence regardless of legal consequences; nor, we may be sure, will the example be lost elsewhere.

We have not had the pleasure of inspecting the blacklist of the Central Federated Union, but, from the accounts which appear from time to time, we are forced to believe that it is a long one, containing many distinguished names. It would be unfortunate, doubtless, from the Union's point of view, if this list should become an honor roll, but something of the sort seems not unlikely to happen. The latest addition, according to report, is the name of Street Commissioner Woodbury, who is punished for refusing to sanction a change from white to brown or black in the uniform of the street cleaners. Mr. Woodbury based his refusal largely on the fact that the adoption of the white uniform was due to Col. Waring. The public will fully agree with the Commissioner that it would be a great misfortune to destroy any part of the influence which the memory of Col. Waring has on the Department. Besides this, the reasons which, in spite of the ridicule of the fun-makers, brought about general approval of the white uniforms when first introduced, are as convincing now as ever. By all means let us retain our "white wings," and let them remember to clean the streets in the way which Waring taught them.

The most striking feature of the passage of the new Excise Tax bill by the

New York Assembly on March 31, was the weakness of the opposition as shown both in the test vote taken early in the day and also on the final roll call. Eighty-four of the eighty-nine Republicans were recorded in favor of the bill. Doubtless this was largely due to the peculiar methods adopted by the protesting liquor dealers. They began by extravagant threats of political retribution, and ended, according to common report, by cynically sending a corruption fund of huge proportions to Albany. As a result, such arguments as they might have presented were hardly brought forward at all, and were accorded practically no consideration. Action on the bill was unexpectedly hastened, and the doors were closed against the lobby. This was justified, if for no more definite reason, by the impression which the dealers themselves, with their open talk, had created. The bill is primarily a revenue measure. As such, it is expected to bring to the localities a total annual revenue of $9,000,000, and to the State treasury a like sum, which is $5,000,000 more than the present excise tax yields.

The March number of the *Economic Journal* of London has a long article on the New York money market, in which some acute observations are recorded. Among the causes tending to stringency the writer mentions the fact that some of the largest city banks are not really independent entities. "They are inextricably drawn," he says, "into arrangements for carrying through vast operations in which their directors are not only interested but controlling factors." This is certainly true, and it goes far toward explaining the present situation. There are single banks and groups of banks of the first magnitude controlled by "promoters," or so much so at least that their executive officers are not quite free agents. Every bank ought to take care of its customers first—that is, to make advances to and discount the business paper of its depositors; but its ability to do so is dependent upon its cash reserves. If the reserves are too heavily drawn upon for "vast operations" of a non-mercantile character, which turn out to be more or less permanent investments, the bank cannot discharge its prime function of taking care of its customers, or can do so only partially. When a pinch comes, then, if it is dominated by promoters, it will curtail its loans to the smaller depositors. On the other hand, if the magnates do not get what they want, they can turn the bank officers out of their places. The National Banking act aims to prevent large advances of money to single individuals, or single interests, by a provision that no bank shall lend more than one-tenth of its capital to one person, corporation, or firm; but probably no person, corporation, or firm is ever prevented by that rule from getting any amount of money that a bank can supply if the applicant is a controlling factor in the management.

In the evidence on the Union Pacific injunction mere hearsay played as large a part as it does in a fairy tale. It is "a man in high standing" who tells a well-known Republican politician that a notorious operator would sell to a great railroad operator certain shares of Southern Pacific stock at a price, and a smaller number of shares at a higher price. One is given to understand that the larger offer at the lower price was of pool stock, while the smaller offer at the higher price was of the individual holdings of the manager of the said pool. This duplicity of price and management has been emphatically denied, but the denial brings out strikingly the fact of an uncomfortable issue of veracity between prominent gentlemen supposed to be men of their word. One who attempts to take moral soundings in speculative pools will need a long line, and then may find no bottom. It is significant that a prominent Republican politician could believe that a great Wall Street operator was selling out his associates. In short, there seems to be a tendency to pool not only money and stock, but business honor as well. The stock and the honor, the whole contents of the pool in short, may apparently be sold out at various prices, like lemonade at a fashionable bazaar.

As there is good reason to believe that the Danish Government will make another attempt to dispose of its West Indian possessions to this country, it is well to call attention to a report of the Danish Bureau of Statistics on the last census of the islands, taken at the same time with the census in Denmark, in February, 1901. The decrease of population on the three islands has been marked. In 1890, when the previous census was taken, the total population was 32,786; in 1901 it had fallen to 30,527. The loss was greatest on St. Croix, only one town, Frederiksstad, showing an increase. Of special interest, in connection with the possible annexation of the islands, are figures relating to illegitimate births, which constitute 70 per cent. of the total number. The census offers no particulars regarding the distribution of races, but it has been estimated that on the island of St. Croix the white people constitute only 3 per cent. Only 427 of the population are of Danish birth, and only 53 are from this country. The largest foreign population is found on St. Croix. Church affiliations are: Church of England, 36 per cent.; Roman Catholic, 28 per cent.; United Brethren (Moravian), 20 per cent., with only 2 per cent. belonging to the Lutheran, the Danish State Church.

During the great Italian strikes of four years ago the assertion was freely made that a revolutionary movement was masking in the guise of industrial agitation. The truth turned out to be that, while the strikes were of Socialistic origin, the dangerous form they assumed was due to tactless repressive measures on the part of a reactionary Government. While the parallel should not be unduly pressed, the general strike in Holland seems to be of somewhat similar origin and growth. The Dutch proletariat is protesting against Premier Kuyper's rigid labor laws, just as the Italian proletariat resented Rudini's stern application of military law. It will be remembered that the Dutch Premier some weeks ago, when a general strike seemed imminent, introduced bills authorizing a special brigade for service on the State railways, and appointing tribunals to pass on the legality of labor agitations. The laws themselves seem to be good laws. The plan, particularly, of putting the employees of State railways under military discipline has much to be said for it. It was the prompt mobilization of the Italian railway operatives, under this system, a year and more ago, that gave time for mature deliberation and the adjustment of grievances, thus averting a formidable strike.

Government officials can never be permitted that freedom to drop their work without notice which is perhaps too readily accorded to private wage-earners. Premier Kuyper's bills do little more than apply this unquestionably sound principle. But it seems that they were introduced at a time and in a way to provoke precisely the situation they were intended to make impossible. The working people of Holland are striking to-day not, as they declare, on a matter of wages or general conditions of employment, but simply to secure the withdrawal of these obnoxious bills. When the tenacity of the Dutch character is considered, and the wealth of the working class and its consequent ability to maintain a long fight, the situation looks very serious. The talk of German intervention seems merely journalistic. The Kaiser can hardly mean to make unwelcome proffers of aid which would stamp him as the deliberate enemy of the peace of Europe. It looks as if the Dutch Government must pass through a stormy season, yet no one need doubt that the tight little kingdom is abundantly able to handle its own difficulties. But it is hard to see how Premier Kuyper can long keep his place in the face of a general strike, any more than Rudini could in Italy; and the solidarity of trades as remote as the railroad men and diamond cutters in the present movement attests the strength of the new industrialism in one of the most conservative of the European nations.

THE PRESIDENT ON HIS TRAVELS.

Mr. Roosevelt's speech at Chicago on Thursday was an unnecessary preaching of the gospel to the already converted. The West certainly does not need to be taught swagger. At the very moment when superheated national jealousies on the subject of foreign complications were beginning to cool down, the President chose to inflame them again. It is like giving whiskey to a man in danger of sunstroke, instead of putting him in an ice pack. And if the speech errs sadly in point of taste and timeliness, its manner is surely of a sort to make the judicious grieve. Deprecate the inference as the President's friends may, his language went echoing across the sea as a rude defiance. His words were blows. He is the reincarnation of that quarrelsome Pole who, when remonstrated with and told that he had not really been insulted, replied, "Yes, I know that, but I thought it safer to knock him down."

President Roosevelt has the air of an enthusiastic discoverer of the Monroe Doctrine. He utters his vows with all the ardor of a lover at the feet of a blushing damsel, and as if she were not really a lady of a certain age who has had many suitors in her time. "I believe in the Monroe Doctrine with all my heart." We knew that, but what we doubted was whether his head had been sufficiently involved. That doubt cannot but be heightened by some of the strange statements of fact and sorry gaps in reasoning which appear in this latest Monroeizing of the President's. Mr. Roosevelt proceeded to construct his history of the Monroe Doctrine and its application to the interoceanic canal and to the question of national armaments. In his account of its beginnings, he said that it was purely our "primacy in strength" which led us to warn European Powers not to encroach upon American territory. This is to ignore entirely the fact that what John Quincy Adams and the men of his time objected to was the extension of the European "system" to this hemisphere—that is, government from a distance, arbitrary rule of people unrepresented. Our doing the same thing now in the Philippines might make us ready to be silent about all that; but if we speak of the matter at all, it is just as well not to pervert the historical fact. Time was when Theodore Roosevelt was full of this correct view of the Monroe Doctrine as a protest against colonial government. Hence it was that, in his magazine article of 1896, he wrote: "Every true patriot, every man of statesmanlike habit, should look forward to the day when not a single European Power will hold a foot of American soil." There spoke an enthusiasm for self-government which the writer, as little as his countrymen, then dreamed that the events of two years later would quench.

It was also the Monroe Doctrine, went on the President, in his easy improvisation of history, which made the United States determine that the isthmian canal should be built "by no foreign nation, but by ourselves." Thus summarily is blotted out the record regarding that French enterprise, the Panama Canal, to which the United States, by the hand of President after President and Secretary of State after Secretary of State, quietly assented. That the country turned a sharp corner and finally took the canal itself, is scarcely historic warrant for what the President now says we have "steadily believed." As little exact is his reference to the Hay-Pauncefote treaty, which, he says, "stipulated" that the United States should have the right to take "any measures which it found necessary to secure by its own forces the defence of the United States and the maintenance of public order." He was apparently thinking of the first treaty, which was, indeed, amended to that effect, and then rejected by Lord Lansdowne, partly on that very ground. In the treaty sent to the Senate by President Roosevelt on December 4, 1901, there is no such stipulation, but, on the contrary, a provision that "the canal shall be free and open to the vessels of commerce and of war of all nations."

One might pass over some of the President's slips in logic. He praised the "good faith" of Great Britain and Germany in the Venezuelan affair, yet went on to say that nothing but our superior naval strength could make the Monroe Doctrine "respected by any strong foreign Power." Was, then, our navy stronger than the combined fleets of England and Germany? Mr. Roosevelt explained that the reason we won so easily from Spain was that we were fully prepared; but shortly argued that "if we only prepare sufficiently, no war will ever come." Perhaps he meant this as an exercise in faulty reasoning for the Chicago students to correct. But there is no need to dwell upon minor defects when we have a speech which was one long blazing indiscretion from beginning to end. The worst of it is that President Roosevelt's acts are so much better than his words. He flings about verbal firebrands, but, in practice, he works for peace. Everybody familiar with the inside history of the recent Venezuelan imbroglio knows that the President was the patient and long-suffering man who soothed and held back the hot-heads in Congress and the navy. Why he, who knows so well how wild the naval officers were then, and are still, for a war with Germany—why he, who rebuked them and kept them in—why he, a man who acts as if he desired peace, should speak like a man spoiling for a fight, is, we confess, a great puzzle. He does not need to do it for the sake of popularity—that he already has. He surely cannot wish to affront the sober sentiment of this country, or to put himself in the posture of challenging foreign nations. What can be his motive? We know not, unless it be to emulate the example of the Emperor William, who talks more about war and does more for peace than, perhaps, any ruler living.

PERAMBULATORY TARIFF NOTIONS.

If President Roosevelt's speech at Minneapolis were submitted as a thesis for a prize or for a degree in political economy, it would be rejected by any board of examiners in the world. It is so self-contradictory and so at variance with former protectionist arguments that it cannot be taken seriously. Such a jumble cannot be held to express any real opinions of the speaker himself, but rather those which he thinks will just now catch the greatest number of votes.

The general tariff policy to which Mr. Roosevelt adheres, and to which he believes the country is committed, "is," he tells us, "fundamentally based upon ample recognition of the difference between the cost of production—*that is, the cost of labor*—here and abroad." Here he came very near tripping himself. It is not true that our general tariff policy is based upon the difference between cost of production here and abroad, but if it were so it would be easy to show that the cost of production is lower here than abroad as to a countless number of articles—so many, indeed, that cost of production has long since ceased to cut any figure as an argument for protection. Most articles of agriculture are in this category. Most of the products of iron and steel are in the same class. Wood, glass, borax, coal, and a thousand other things might be named whose cost of production is cheaper here than in any other country.

This truth evidently flashed upon Mr. Roosevelt before he finished his sentence. So he injected the words, "that is, the cost of labor," thus saving himself from one horn of a dilemma, but immediately impaling himself upon the other. He affirmed or insinuated that cost of production and cost of labor are the same thing, whereas every tyro knows that they are not the same. The natural resources of one country may be so superior to those of another that the cost of labor is not worth considering as an element of competition. One country may have machinery so much better than another that cost of labor ceases to be a factor of importance. In one country, labor may be more intelligent than in another, and may therefore supply a greater output in a given time. Finally, when other things are equal—when natural resources, machinery, and intelligence are substantially the same in two competing countries—the very fact that one of them pays higher wages than the other often gives that one an advantage. The higher wage makes the superior workman in the long run. This fact is well recognized in all manufac-

turing industries. The workman who is only half fed and whose mind is distracted to pay his household expenses, cannot do the same amount of work as the one who has meat on his table at every meal and a growing surplus in the savings bank. It is a common complaint in both England and Germany today that they find it hard to compete with the United States in manufacturing on account of the high wages paid by us.

"It is a sign of a dogma in dissolution," said Professor Sumner, a quarter of a century ago, "to change its form, and to yield points of detail, while striving to guard its vested interests and traditional advantages." He was speaking of the dogma of protection, which was even then shifting its ground and trying to guard its vested interests while abandoning its old positions. It had gained its advantages by the "infant industry" plea, by telling us what a fine thing it would be for the country to build up manufactures, and how proper it would be to lower the tariff after this end was accomplished. Its advocates said, too, that when the time for revision came, the tariff would be revised by its friends. In their judgment the time for revision came twenty-two years ago. Their opponents were a good deal surprised by the announcement, and they welcomed the appointment of the Tariff Commission of 1882. This body, composed of the chosen leaders of protection, frankly declared that the duties on imports were too high, and that they ought to be lowered as much as 20 to 25 per cent. It seemed, for the moment, as though the beneficiaries of the tariff intended to keep their word; but when the bill which their Commission had prepared was laid before Congress, they rushed to Washington in droves and rent it into fragments. Since that time the tariff has been twice amended by the Republicans in the direction of higher instead of lower duties, and we now have the highest one ever known in the country's history, with possibly one exception.

Now, President Roosevelt tells us in substance that we have the mightiest and most prosperous manufacturing industry in the world (which is the truth), and for that reason ought not to abandon the policy of protection. The old arguments have been turned inside out and topsy-turvy. The dogmas upon which protection is founded are in dissolution, but the practice continues just the same. In one part of his speech Mr. Roosevelt seems to argue that the system ought never to come to an end, but, remembering at an opportune moment that Gov. Cummins and Chairman Babcock and other influential Republicans hold contrary views, he says, parenthetically, that changes may be made in particular paragraphs or schedules "wherever and whenever necessary." Then he introduces another saving clause—"if such change is demanded by the interests of the nation as a whole." Who is to determine when a change is necessary? Who is to decide whether the interests of the nation as a whole demand that our protected manufactures shall be sold as cheaply to domestic consumers as to foreigners? Until now we have allowed the producers of the goods to answer these questions for us, and we see no sign that President Roosevelt contemplates any different way of reaching a decision.

EXPLOITING THE PHILIPPINES.

A frank confession, or perhaps we should say brutal exposure, of our commercial dealings with our colonial possessions is supplied in the March number of the *Journal of Political Economy*, from the pen of Mr. Robert F. Hoxie. He points out, with chapter and verse, that we have enacted laws to exploit the Philippines for our benefit and their detriment, that we have already violated our treaty with Spain, touching her right to equality of trade there, and that we are estopped by our own acts from demanding from other Powers an "open-door" policy in other countries of eastern Asia. This climax, or succession of climaxes, was no part of our purpose when we took the islands, nor has it been the result of deliberation at any time, but it was inevitable that private interests would be alert for gain; that they would go to Congress and to Departments in Washington and to the public authorities on the other side of the ocean, and that, by pushing here and there on the lines of least resistance, they would finally get what they wanted. As the Filipinos themselves were not consulted, it was quite natural that they should not be protected against exploiters. Does anybody ask why the Government of the United States did not protect them? The Government of the United States consists of persons who are engaged in protecting themselves. Their first and principal task is to prevent other persons from supplanting them in the places of power. That is Mr. Roosevelt's chief undertaking, and so it would be that of any President except one of a higher type than we are likely to see. That is the reason why the Filipinos have not been, and never will be, protected so long as they remain the subjects of a distant people who have none too much time to bestow upon their own government and to keep it in working order.

The first movement for the exploitation of the Philippines was made through tariff duties like those of the colonial system of the eighteenth century. The object of colonies, as then understood, was to have "outlets" for goods, where exclusive trading privileges should be enjoyed by the merchants of the mother country, or where they should be favored by discriminating duties. This idea was broached by Gen. Otis in a letter dated April 14, 1900, in which he innocently suggested a revision of the Philippine tariff by reducing the duties on articles imported from the United States. Such a reduction, he said, would be beneficial both to the business interests of the United States and to the Philippine people, while a similar reduction for European products would reduce the revenue of the islands without any compensating advantages. Authority for such a revision was granted at Washington. Presently there came a great number of petitions for reductions of the Philippine tariff for the benefit of our export trade without any regard to Philippine interests. A schedule of duties based upon this conception was adopted.

But that was not all. It was discovered that in our treaty with Spain we had agreed that she should have equal trading privileges with ourselves in the Philippines for ten years. Plans to circumvent this clause of the treaty in behalf of our exporters were brought forward. For example, the wines of Spain were entitled to admission on the same terms as our own, but it was found that Spanish wines contained a larger percentage of alcohol than those of California, and the shrewd suggestion was made that the duty should be a sliding scale based upon the alcoholic test, so as to give the California exporter an advantage. This cheating device was adopted. Mr. Hoxie reproduces a naïve correspondence on this subject between Mr. E. R. Lilienthal of the Crown Distilleries Company of San Francisco and Col. Clarence R. Edwards of the Insular Division of the War Department. The former expresses his thanks for the "patriotic impulse" which prompted our officials to "prefer American interests which have been hampered by the treaty with Spain." He concludes by saying, "All admit that, as the tariff is now framed, a decided advantage has been gained and will be realized." Col. Edwards replies, under date of October 14, 1901, without any apparent suspicion that a dishonorable act has been committed, saying: "To receive such recognition of effort made, from those interested, cannot be otherwise than gratifying to those who have participated in the framing of the tariff." Numerous other subterfuges were adopted to evade the Spanish agreement, and Col. Edwards was so well satisfied with the success of the plan that he assured the Republican members of the Ways and Mean Committee that "while no different duty in favor of American products is openly mentioned, the articles were so described as to allow an advantage to American goods."

The next chapter in the shameful record is the American tariff on Philippine products. We had made the Philippine tariff on American products to suit our-

selves—that is, to suit the protected interests. Now we turned our thoughts to the other end of the bargain. The Philippine Commission had urgently requested a reduction of one-half of the Dingley rates of duty in favor of Philippine products. Congress allowed only 25 per cent. reduction, but at the same time it abolished certain Philippine export duties on goods coming to the United States, while maintaining them as to the same goods going to other countries. Among these was Manila hemp; the effect of the act was to give our manufacturers an advantage over those of Europe in the cordage trade. Thus we killed two birds with one stone—the Filipino taxpayer and the British rope-maker. But we did something more. We trampled under foot Secretary Hay's "open door" policy in China before the ink was fairly dry; for it is not to be supposed that any Power will consider itself committed to a trade policy in China which is not observed by ourselves in the Philippines.

"Given the conditions," says Mr. Hoxie, "the result was inevitable." So much was foretold by the Anti-Imperialists at the start. They said that if we seized the islands certain forces in which human greed bore the largest part, would be let loose with no effectual check upon them. These objectors did not, indeed, foresee the "felonious homicides" and all the barbarities that we should practise upon the unhappy people of those islands, but they did foresee that whenever a dollar could be made out of them, by fair means or foul, somebody, wrapping himself in the American flag, would find a way to get it.

ARMY STAFF PROBLEMS.

It is fully two years since the system of line and staff details was established in the army by act of Congress. Up to that time the staff officers—paymasters, quartermasters, commissaries, adjutants-general, ordnance officers, and inspectors-general—were men selected from civil life, or from the line of the army, who served permanently in the corps to which they were appointed. The Spanish war having brought out the grave evils which resulted from this permanent divorce of the men who did the fighting and those who kept them supplied, Congress decreed that after February 2, 1901, officers should be transferred to the staff for four years only, and should then return to duty with troops for at least two years, in order to prevent their becoming mere bureau officers without experience of the needs of soldiers. In the period that has elapsed, the new system has been an unqualified success in the Adjutant-General's Department and in the Inspector-General's, and, so far as the army is concerned, in the Quartermaster's and Commissary Departments.

Yet the present head of the Pay Department, the Commissary-General, and the Chief Signal Officer, who have grown gray under the old system, have recently condemned the workings of the four-year details. The Paymaster-General, for instance, finds great difficulty in getting the line officers, of which he has six, to conform to the requirements of his bureau. The chiefs of the other bureaus have not as yet made their complaints specific, but are content to advertise their belief that, before the first four-year detail period is over, "the demonstration of the failure of the system will be conclusive." There can be no doubt that in their minds the wish is father to the thought. The staff and line transfer act dealt a fatal blow to the prestige of the staff, previously the all-important part of the army. As the permanent officers go on the retired list, the disappearance of the staff prestige is very marked, and with it goes that considerable political power which was the ruling influence in army politics until the incumbency of Secretary Root.

It may well be that Paymaster-General Bates's six line officers have had some difficulty in mastering the intricate and often old-fashioned methods for which the Pay Department has long been famous. But, even so, it cannot affect the reform at issue, which has unquestionably worked well in the other departments. It will take a much longer period than two years, and the failure of more than six officers, to impugn the admirable principle which underlies the new system. And if it should really be impossible to simplify the pay methods so as to bring them within the comprehension of the average officer, it would still be feasible to instruct line candidates at Washington, West Point, or a post-graduate school, before turning them over to the complexities of Gen. Bates's red tape.

A more serious consideration is the fact that there seems to be some difficulty in getting officers to accept staff positions. Before the war with Spain, there were hundreds of candidates for every staff position; at present the chances of active service in the line are more attractive. The Ordnance Corps, for instance, needs sixteen lieutenants, and the Signal Corps eleven. But the latter's needs have only just become known, and vacancies in the Quartermaster's Department, the Commissary-General's, the Adjutant-General's, and the Inspector-General's do not go begging. The trouble with the Ordnance Corps is that the work is so extremely technical that by no means every graduate of West Point is fitted for it. Moreover, nine-tenths of the lieutenants of the line are untrained civilians or former volunteers without even a comprehensive knowledge of purely military duties. This was well illustrated by the failure of half the student officers at Fort Leavenworth in their recent mid-year examinations. Every ambitious lieutenant is just at present bent on developing into a line officer, and few have time to give any thought to preparation for more technical work. But these are conditions growing out of the enlargement and reorganization of the army which are certain to pass away, thanks to Secretary Root's barrack and service schools. And as they disappear, the Secretary's wisdom in bringing about the staff and line transfer will be more and more evident.

The discussion, however, has brought out again the need of further staff legislation. The preposterous state of affairs still obtains by which the quartermaster supplies the table at which the soldier eats, the commissary the food which he eats; the ordnance officer the utensils he uses, while the paymaster gives him his clothing allowances. Until this can be done away with, Secretary Root's reforms will not be complete. Last year he introduced a bill consolidating the supply departments into one bureau known as the Quartermaster's Department, subdivided into a supply and construction division, a commissary division, a finance division, and a transportation division. The plan was by no means a perfect one, yet it represented a vast advance over present conditions, under which, as was illustrated every day during the Spanish war, the heads of departments carry on their business without the slightest information as to what is being done in the adjoining offices. The bill was held up, largely by staff influence, and was not pushed during the session just ended because of other important legislation. It is safe to say that Secretary Root will return to the subject with, it is to be hoped, an even more drastic consolidation measure. The only proper system is the navy's, in which the paymasters do all the work of the army quartermasters, commissaries, pay officers, and part of that of the Ordnance Corps.

"RACE SUICIDE" IN FRANCE.

The declining birth-rate, which is now attracting attention here in the case of our educated classes, is in France a much more portentous phenomenon. During some recent periods the annual increase of population has been as small as 35,000. For the last fifty years of the last century the total increase in France was 3,340,000; in Italy it was 8,833,000, in Austria-Hungary and in Great Britain over 14,000,000, and in Germany nearly 21,000,000. In 1900 the deaths in France exceeded the births by 20,330. In Germany the births exceeded the deaths by 795,000; as Moltke said, in this way Germany wins every year a great battle. Were it not for immigration, there would be every year fewer inhabitants in France; there are every

year fewer Frenchmen. There is no excessive mortality; the death-rate, both among adults and among infants, compares favorably with that of other nations. Nor is the marriage-rate, although declining, much below that of neighboring countries. The decrease in population is due simply to the fact that marriages are not fruitful. In one-sixth of the families there are no children; in one-quarter there is but one; in one-fifth there are but two; the average for all is but three.

Is France overpeopled? It has less than 72 inhabitants per square kilometre, while Austria has 78, Germany 98, Italy 110, England 120, and Belgium 206. The price of wheat has fallen regularly for thirty years, so that we cannot regard famine as a cause of depopulation. On the other hand, we cannot accept the theory of M. J. Bertillon, who contends that prosperity changes "prolétaires" into "propriétaires"; for prosperity is greater elsewhere than in France. It may be a cause, but it cannot be the chief cause in France. Neither the poverty of the poor nor the wealth of the rich is a sufficient explanation.

But the reason is not far to seek. M. Henry Clément, in a recent number of the *Réforme Sociale*, shows us clearly enough where to look. In spite of many admirable and beautiful features, French civilization is seriously defective. Considering the paucity of births, we might expect that the lives of young men would be held sacred, but they are sent off to die of malaria in Tonquin and Madagascar. Since more people are wanted in France (where every Frenchman wishes to live and die), nothing could be more imbecile than to pour out treasure in maintaining worthless colonies—colonies which are really ulcers on the body politic. In its international relations, France is absolutely secure. It has no jealous neighbors; all they ask of France is to be let alone. But, in the face of a yearly deficit, with a debt of more than seven—according to some estimates more than eight—billions of dollars, the rulers of France continue to force the peasants into the barracks and to squander their savings in military and naval preparations.

When the average tax per head amounts to 130 francs, when the deposits in the savings banks are falling off and the value of property is declining, there is certainly some excuse for men who hesitate to bring children into the world. If these are many, they must sink to a lower station in society than that of their parents—a possibility which even in this country causes parental shuddering. But the great cause, the permanent and constant cause, as M. Clément shows, is the law regulating the devolution of property. The reformers of 1793 were so eager to break up the great estates of the nobility that they shattered the small holdings of the peasants. As Sir Henry Maine said, they created a system of petty entails, and rendered it impossible to keep property together except when there was but one heir. They destroyed primogeniture and established soligeniture (if the word may be allowed). To compel the partition of all property, real and personal, great and small, at the death of the owner, is obviously in many cases ruinous; and when the property is small and those who succeed to it many, the succession taxes and legal expenses amount to confiscation. Of course, the rural population suffers the most, for actual partition can be generally enforced, and the unity of small holdings is thus destroyed. Where there is but one child, the home may be preserved; when there are several, it is torn to pieces. The evils of this system have been often explained. Edmond About described the situation long ago:

> "The father establishes an industry and dies; everything is sold and partitioned; the house does not survive its master. A son has courage and talent; with his fraction of the paternal capital he founds another house, succeeds, becomes well off, and dies. Another partition, another destruction; everything has to be begun again at fresh expense. Agriculture suffers from this, commerce suffers, common sense blushes at it."

Such a condition is not to be improved by the absurd devices of imposing fines on bachelors and on childless married men; nor is the expedient of paying bounties to large families deserving of attention. Such measures do not go to the root of the matter. Nothing will avail except a reduction of the discouragements to the accumulation of property, and of the restraints on the right of distribution. When Frenchmen can feel that their savings will go to their children, and not be wasted by their Government; and when the right of testamentary disposition is restored, the size of French families will increase. So long as the Government lays a heavy fine on children who are bereaved of their parents, it need not expect that its subjects will multiply. If men are heavily taxed on their earnings and savings, and forbidden to divide them according to their judgment, they will prefer to spend them while they live rather than struggle to provide for posterity. This truth appears plainly enough in France; but it is in the way of being illustrated in the experience of other countries.

SUB-VESUVIAN TOPICS.

POMPEII, March 12, 1903.

Old Luigi has occupied week by week for twenty-two years his little sentry-box on the topmost point of the highest heap of ashes and scoriæ that the excavators have cast up out of Pompeii to the northward. There he sits, and smokes in peace his diminutive pipe of execrable but not cheap tobacco. While the other guards are hurrying through the gaping ruins below him successive groups of drooping travellers, apparently just come from the building of Babel, old Luigi's only duty is to keep a weather eye open for the unduly inquisitive stranger who may want to make his way into the forbidden area of the excavations still in progress, or for the more pertinacious native who advances a hundred plausible reasons for similar transgression from the beaten paths of the adjacent vineyards and orchards. For the troublesome native, Luigi has short words and but scant courtesy. Toward the ignorant foreigner he is more affably disposed, and a pipeful of imported tobacco and a few friendly words open both his heart and his lips.

Luigi has a magnificent view from his high perch. Behind him is the lord of the landscape, Vesuvius. He has been wrapped for an hour in a private mantle of cloud, and that has just lifted to show his great gray shoulders white with unaccustomed snow. Luigi says it will be a hard afternoon for the travellers at the summit. Immediately in front are the roofless, ashen walls of the ruins of the ancient city, sloping down to the very edge of that prehistoric lava-stream that marks the earlier and greater rage of the monarch who visited sudden destruction upon the people that ventured to build upon the skirts of his trailing robe. Beyond, stretches the almost level plain of the Sarno, laid out in rectangular garden patches all the way across toward the rugged, towering heights of Monte Sant' Angelo now capped with the late snows of departing winter. In a sheltered nook half-way up the steep, nestle behind the frowning outpost of a ruined castle the pink and yellow and white houses of the little village of Lettere, whence, just 1,350 years ago, the last king of the Goths marched down to meet defeat at the hands of Narses in the plain below. Further to the left one can just make out the castle of Nocera, where Helena, Manfred's widow, wept her life away in captivity after the lamentable slaughter at Beneventum. At the right, beyond the clustered buildings of Castellamare, the blue Mediterranean glitters out to the twin heights of Capri and the massive dome of Ischia.

Old Luigi lives with his wife and little granddaughter in a single room at Torre Annunziata. "But, Signore," he explains, "it is a very large room, with most elegant furniture, and a truly beautiful kitchen with a stove after the French style. You put in the charcoal, and open a draft, and apply the match, and *ecco!*" And Luigi stretches out both hands wide apart with upturned palms, and lifts shoulders and eyebrows with a smile of illuminating joyousness. "And the grand balcony opens out upon a view incomparable! And about it are set pots of flowers, and in the summer one has the shade of a muscat-vine from which one may pick grapes! And as for the air, figure to yourself! It is veritably a miracle!" For all this luxury Luigi pays a rental of only eight lire a month, and every month he gets from the Government one hundred and twenty lire for his work as *custode* in Pompeii, and from travellers a good sum in addition as gratuities. Eighteen years hence, when he has served forty years, he can retire on full salary. It is, as he says, a good post.

Luigi has, like so many Italians, an artist's eye. But he busies himself not merely with watching the familiar and ever beautiful panorama before him. He meditates, as he sits up there alone, on the serious things of life. One cannot survey Pompeii for twenty-two long years and still think only of the day. "Does it not appear to you, Signore," he asked suddenly the other morning, "that these men of Pompeii were much like the men of the world today—and indeed that all men, all over the world, are made mostly of the same meat? And that is why they are trying in these days to make wars cease? Of a truth, what do wars mean to our poor people? They mean just the pouring of so much blood, and the spending of so many *quattrini*, and all just on account of the caprices of the great. They make their advantage out of it, but the poor people suffer. There was our affair in Massowah—just the caprice of that Sicilian! ["Crispi?" I inquired. "Già."] He said England had done some great things in Africa, and Germany had done some great things in Africa, and now we must. But what happened? Just more blood and more money to be spent. And all because Crispi saw the way to put money in his sack." "But," I ventured timidly, "perhaps Crispi really believed that it would be a good business venture for Italy." "No, no," he retorted (and here, in his eagerness, he dropped out of his polite Italian into dialect), "don't you believe it! It was to feather his own nest. Everybody knows it. Look at him! What was he? Just a commonplace poor lawyer, without a soldo to his name. So he turns to politics for a living, and finally gets himself elected a Deputy to Parliament. And then he manages the trick, and becomes a Minister, and then the head of the Ministry. And then he brings on a war, and fills his own pockets, and goes home rich! *Ec'!* And he said the poor Africans needed civilizing. [I couldn't help thinking of the Philippines!] What was there there? Nothing but sand! And why not save the blood, and spend the money in schools and in civilizing a little bit the people of Calabria? There they need civilizing more than in Africa! *Ec'!*" And Luigi halted for some meditative puffs.

The condition of the people in Calabria is indeed unspeakable—from all reports quite as bad as in the Middle Ages, if not worse. In almost every point of economic and social progress southern Italy, including the old Bourbon kingdom, stands far behind northern Italy, but Calabria is as far below the province of Naples as hell below purgatory. The Italians themselves shake their heads over it, but apparently the problem is too great for the Government to face. Every one has heard of the notorious southern brigand Musolino, who was finally rounded up. Only yesterday a well-known captain of the Royal Carbineers, who has recently achieved a reputation by detective service against other members of Musolino's band, was testifying on the witness-stand. His precise words are enough to give some notion of the conditions that prevail in parts at least of the interior of Calabria.

"In all my service, in Sicily, in Sardinia, in Calabria itself, I have never seen so wretched a region as this where I have recently been. There are no roads, no means of communication with the outer world, no resources of any kind; nothing but the most debasing poverty. There are human beings who herd with their cattle, in roofless pens, muddy and pestilent. The bread they eat is made of vetches. They never taste meat unless they can manage to steal a bit. The utmost that a workman can earn in a day is forty centesimi (eight cents). Civilization has not yet reached those regions. Life is in its primitive stage, and morality as little developed. When I went to one place on duty I found they had no cemetery at all. The bodies of their dead they wrapped in a sheet and threw into the cellar of an old ruined church—a sort of a fleshpit of rottenness—where the hogs used to go to feed on the corpses. It is a torture for officials to serve in such a region, and it is well known that a brigadier of Royal Carbineers committed suicide because he had been assigned to duty there."

There is indeed much poverty in southern Italy, especially in the towns, but in general nothing like such horrors as have just been mentioned. As in ancient times, people have drifted into the towns, and it is difficult to devise any scheme for settling them elsewhere. In our little neighboring city of Torre Annunziata, for example, there are said to be many hundreds of men (some say thousands) absolutely unable to find a stroke of work to do. And Italy is notoriously a prolific country. Most of these men have large families of small children. "How do they manage to live?" I inquired of a native. "Oh, simply and solely on charity, on the little sums that their children can beg for them. And it is surprising on how small a sum they can manage to subsist." And so southern Italy is raising up a generation of beggars. At present, however, things are improving a trifle. Southern Italy lags about fifty years behind Piedmont and Lombardy, but even here one begins to see more and more the chimneys of factories, unlovely to the eye of the sightseer, but pleasing to that of the philanthropist, and so the problem of work for the unemployed in the towns is gradually being solved.

In the country, the condition of the peasants is relatively better. They are a hard-working class. Men, women, and children of a family work together on their very small holdings of land, and almost all the work appears to be done by hand, with primitive but effective tools, except the carrying of produce to market. Then the sturdy little donkeys and almost equally diminutive horses are pressed into service. Frequently the donkey and the family cow are harnessed together. I have seen no ploughs in use short of the region of the Silarus, in the neighborhood of ancient Pæstum, where the other day yokes of sturdy white cattle were dragging through the rich soil wooden ploughs not very different in shape from those in use two thousand years ago. It was at Pæstum also that I saw, a few years ago, a lofty circular threshing-floor spread with sheaves from which the farmer was beating the grain by driving a yoke of muzzled cattle round and round upon it. And a short distance away his son was winnowing the grain by throwing it up into the air with a big wooden shovel for the wind to blow the chaff away. Other remnants of ancient methods prevail throughout the entire countryside, even here in the Sarno valley. Women still teach their daughters to card and spin with distaff and whirling spindle the threads of cotton, flax, or wool, precisely as their forbears did so many generations ago. And then they are woven at home on a wooden loom of antique pattern but surprising effectiveness into fabrics that appeal for fineness and regularity of texture even to my untutored masculine eye, while they have filled my Penelope with covetous admiration.

This Sarno valley is an unusually favored garden spot, because of the canalization of the river, effected some fifty years ago throughout its lower course, which has made it possible to distribute an abundance of water for purposes of irrigation from canals at three different levels. Thus the whole region is richly watered, and, as in the sandy plains of southwestern America, so here, nothing but water is necessary to make these deep strata of Vesuvian ashes wonderfully fertile. Indeed, a freshly thrown-up heap of débris from excavations will next season produce as fine a crop of potatoes as if it had always been addicted to an agricultural life.

The country people talk much of excavations in search of valuable antiquities, but do little in that direction. The risks are too great. They must work their land intensively in order to live, and a good cabbage patch is a more valuable asset than a precarious chance for treasure-trove, especially, also, as the holdings are so small that any part devoted to excavation would surely be a very considerable proportion of the entire farm. But every peasant appears to cherish a private hope that the Madonna may some day be as good to him as to the Signori who have now and then made more out of chance finds than out of a century of straight farming. Great interest was excited, some few years ago, among peasants as among archæologists, by the lucky discovery made in a cistern of a *villa rustica* in the territory of Bosco Reale, only a mile or so from Pompeii. There was found the skeleton of a man who had taken refuge in that place of fancied security from the fatal shower of ashes. He had with him a lot of gold jewelry, over a thousand gold coins, and a magnificent table service of wrought silver, of more than a hundred pieces. Best of all, to the untutored mind of the peasant, was the success that the discoverer had in bribing the Government inspector, and concealing the knowledge of his find till he could spirit it out of the country. The paternal Government of Italy has a way of granting no permission to excavate for antiquities, even upon one's own land, without demanding a specified share of the finds; and as to the rest, it retains the right to decline to purchase them itself, while forbidding the owner to sell to any other customer. The result is, that the stringent law against the exportation of antiquities is constantly evaded by means of bribery.

The discoverer of the treasure of Bosco Reale enriched himself by disposing thus of his plunder, which now reposes in the Museum of the Louvre. Every landowner in this vicinity would like to emulate his example. Indeed, the last discovery of similar sort is even yet the subject of litigation between the Government and the stubborn owner. A waterside tavern was partly excavated some months ago, close by the road that now runs from Torre Annunziata to Castellamare by the little church of S. Antonio, and not far south of the church. In this inn a considerable number of fugitives from the eruption had taken refuge, and, unable, like the elder Pliny, to find escape by sea, had perished there. Some of them were carrying with them, or wearing, their most valuable possessions—among them a

man with gold chain, bracelet, and rings, whom an Italian archæologist, Signor Canizzaro, forthwith identified by some mysterious mediumistic process as the elder Pliny himself! Worse than that, he heralded his discovery to the learned world. To say nothing about the simple fact that we are fully and authentically informed by his nephew concerning the circumstances of Pliny's death away the other side of the Sarno, and concerning the rescue of his body the day after the eruption ceased, it was amusing to have Signor Canizzaro identify as Pliny the skeleton of a man all tricked out with jewelry, when Pliny himself in his 'Natural History' satirizes unmercifully the wearing of such trinkets by members of the male sex. But the jewelry is now safely stored away, and further excavations suspended until the owner can have his legal rights in the premises established. Of certain other private excavations in the neighborhood of Bosco Reale it is yet too early to speak.

The sociologist as well as the archæologist finds his interest in this neighborhood at present. There is a most vigorous discussion going on at Naples concerning the "municipalization of bread"—that is, the proposal to establish bakeshops under the management of the municipality for the manufacture and sale of bread, on which the poor chiefly depend for food. Such socialistic experiments are by no means unknown in Italy, though it is in Sicily, at Catania, that the most successful effort of this sort has been carried through. Even though the statement of the prosindaco (acting Mayor) of that city, that the price of bread to the consumer has thus been reduced 30 per cent. and its quality much improved, is somewhat misleading, because certain other elements have contributed to that result, there seems to be no reason to doubt that a substantial gain has been attained in the amelioration of the condition of the poor. At Naples there has recently been a decided reduction in the price of bread, due partly to a reduction of the tax on flour, and partly, perhaps, to the fear among private bakers that high prices might bring about the realization of such municipal competition as they evidently fear. Up to 1902, bread of ordinary quality sold in Naples at 38 centesimi the kilogramme; it is now selling at 32, but it is claimed that this reduction is largely nominal, being balanced by scant weight and adulteration of flour. The friends of the municipalization of bread at Naples urge that the quality can be improved and the price lowered by the intervention of the commune in the business, and that, as bread is one of the chief necessaries of life, the community ought to undertake to furnish it at the cost of production. The opponents of the scheme plead the stock arguments—that private enterprise and competition might better be stimulated than suppressed; that it is doubtful whether the city could produce bread as cheaply or as well as private firms; that opportunity would be opened for all sorts of political jobbery, and the city might wake up to find itself saddled with heavy debt, and so forth. It is curious to notice that not much stress seems to be laid by the opposition upon the argument that the state should not, on general principles, undertake any such business schemes at all. The socialistic principle seems to be pretty generally admitted.

The outcome of the discussion is still uncertain. The municipal Giunta, with the Mayor at its head, presented to the city Council a report that was distinctly unfavorable in tone, though it apparently tried to avoid bitterness of controversy, and the Council has finally ordered the appointment of a special commission to study the subject in all its bearings, and report its findings and recommendations to the Council within two months.

As I write these last words, Vesuvius is firing minute-guns of heavy artillery, and throwing up, hundreds of feet into the air, brilliantly gorgeous Roman-candle-bursts of fire, mixed with white-hot stones that fall far down the mountain side, and glitter against its dark flanks for some time after they have reached their final resting place. I have seldom seen a more imposing spectacle.

E. T. M.

Correspondence.

AN OPEN LETTER TO THE PRESIDENT OF THE CARNEGIE INSTITUTION.

JOHNS HOPKINS UNIVERSITY,
March 25, 1903.

DEAR SIR: The interest you showed in certain remarks of mine, encourages me to advocate the establishment of an Academy of Sciences in connection with the Carnegie Foundation. Of course, the word "sciences" is intended in the broadest sense. I mean an academy of natural sciences, philosophy, and letters. Let me say at once that the word "academy" need not appear in the matter at all. I suggest that the Carnegie Foundation shall gather about itself a body of men, distinguished in all forms of learned research, under the collective name, "Members of the Carnegie Institution."

What shall be the function of these men? Obviously, the direct action of such a body is in the main two-fold: to carry on the highest researches, and to advise, guide, and help others to carry on the same.

As regards the first point, even the most distinguished and unswerving investigators will find their hands strengthened by working coöperatively under the direct auspices, and with the financial support, of a great and strong foundation.

As regards the second point, it seems to me to lead towards a crying need of the Foundation. That great scientific plans of almost infinite variety cannot be fathered by such an institution without advice, is too clear to need pointing out. It seems to me hardly less evident that such advice cannot in the long run be asked from and given by private persons in their capacity as experts in a given subject. Publicity, criticism, and final agreement of the best opinions are as essential to the best choice of subjects for learned research as they are for the establishment of laws or the government of public bodies.

Restricting myself to the subjects of which I know most, there are sure to come requests for archæological expeditions, excavations, expensive facsimile reproductions of manuscripts, great critical editions of important texts, publications of learned lexical thesauruses, compilations of exhaustive bibliographies, and other undertakings of a similar sort. *Need I point out that it will be the glorious prerogative of the Carnegie Foundation to forward such undertakings?* And need I point out that it will be a lame and halting method to subject proposals of this sort to the scrutiny of the one or the other scholar, to stand or fall according to his individual, sometimes very personal, sympathies and inclinations? On the other hand, if proposals of this sort are brought before the Members of the Institution, I cannot easily conceive how they may fail to be judged on their just merits.

You are aware that quite recently the leading learned academies of Europe have allied themselves into a single body, in order that larger projects which cannot be carried out by a single member of this body may be dealt with fruitfully by all of them together. I am well informed, and I betray no secret in stating, that this union of European academies looks forward hopefully to the time when it may strengthen itself still further by an alliance with an *endowed* representative American body of this same sort. In one form or another the coöperation of the Carnegie Foundation with the largest and most significant undertakings of the allied academies will be, I venture to say, unavoidable. Or I should rather say, that it will be welcomed by the care-takers of the Carnegie Foundation as one of the best opportunities for fruitful action.

Let me illustrate this by a single concrete case. The united academies have sanctioned the project of a critical edition of the text of the great Hindu Epic, the Mahābhārata—it is a crying need of Indic science. I hope that in any case the Carnegie Institution will not withhold its aid, but such aid will come most effectively, most smoothly, and in justest proportion from the Carnegie Institution as a member of this union. What is more important, the Carnegie Institution will have occasion in its turn to request the coöperation of the European academies for its own plans.

There is at the present time in the University of Upsala, in Sweden, a manuscript on purple parchment, written in silver and golden letters. It is the most priceless manuscript in the world, the silver codex of Upsala, the main source of the Gothic Bible and the Gothic language. I hope to see this manuscript reproduced so that every Germanic seminary and every student of German antiquity may handle a perfect facsimile of the original. I have broached the matter to distinguished Germanic scholars; their response was invariably enthusiastic. The coöperation of the Swedish Academy, and, further, that of the united academies, is indispensable for this project. May we not some day desire in this matter the initiative of the Carnegie Institution as well as its financial support, to the special glory of American scholarship and American enterprise? Again, the smoothest way and the surest warranty of such an achievement lie with the Carnegie Institution as a member of this great federation of science.

Clearly then, the Carnegie Institution is designed to become the logical representative of America in the greater coöperative enterprises of the scientific world: it is in this matter a national representative and a national institution. It is hardly necessary to point out that it is even more a

national institution in its relation to the scholars and learned institutions of the United States themselves.

Here, I conceive, lies its greatest opportunity. When the Carnegie Institution shall have gathered about itself an organized body of distinguished scholars, it will be in the position to extend its financial aid in the most fruitful way. But, in addition to that and beyond that, it will also have created a body, membership in which will be prized as one of the highest distinctions which an American scholar may reach. Such a body will be a beacon light to guide and cheer onward the successive generations of scholars, so that they may be less tempted to lag by the way, or to be lured from the narrow and steep road that leads to scientific eminence.

This statement implies that the road which the American scholar travels towards the scientific heights is not at the present time too abundantly illumined by such lights. I think that it may be granted that this is so; that the measure of high scientific reward in the career of an American scholar is scanty; that the hope of membership sooner or later in the Carnegie Institution will go far to encourage high effort; and that this ideal reward will promote the highest endeavor, no less than the direct financial subsidies which are the more immediate purposes of the Institution.

I do not believe that there is any insurmountable or even serious difficulty in the way of this plan. The selection, organization, and propagation of the Members of the Carnegie Institution will need to be elaborated with care. The usual human frailties will tack themselves close on to the heels of the very best undertakings; they will not be wanting here. You and your associates will deal with them patiently and wisely. I would make a single definite suggestion as to ways and means: the members of the Institution should be recompensed for their services, either by a modest fixed income, or by regular stipends for their services as members of the Institution and attendants upon its meetings. This will impart to the undertaking an invaluable element of reality and steadiness; it will strengthen the sense of responsibility on the part of the choosers and the chosen.

The suggestion which I have the honor of making to you comes from one whose single aim it has been to be counted an American scholar and investigator. I am reasonably certain that these words voice a desire of the great body of American scholars and investigators.

Very truly yours,

MAURICE BLOOMFIELD.

President DANIEL C. GILMAN, LL.D.

MONEY AND HUMAN RIGHTS.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of March 26, referring to Senator Money's speech, you say, in effect, that he does not object to the enlistment of negroes in the army; that he is willing to have the negro fight for a flag that will not protect him. I think that this construction of the Senator's remarks is hardly fair. The *Congressional Record* (vol. 37, p. 146) states that he said: "Individually, I did and do object to any negro being in the army of the United States," which seems quite explicit.

I am, sir, most sincerely yours,

JOHANN HEILIG.

CHICAGO, March 3, 1903.

[*Summa injuria, summum jus.* We wrote in dependence on the Associated Press dispatch, which stated that the speaker said he "had no particular objection" to the enlistment of negroes. As reported in the *Record*, his reply to Senator Foraker's inquiry began thus: "I do not know that I ever heard any objection to a negro enlisting in the army, but there would be objection to his serving as an officer." And the passage cited by our correspondent is continued in these terms: "I think, in other words, Mr. President, that this is a white man's country and a white man's government. It was established by white men for white men. It was carved out of the wilderness and conquered from the Indians, not for the African, but for the white man." This is not new Southern doctrine, but, as the colored (not African, but American) population is now at its height in millions, so wholesale a reading of a people out of its birthright was never witnessed in the history of mankind.—ED. NATION.]

CHAUCER, THE PRIORESS, AND PROFESSOR CHILD.

TO THE EDITOR OF THE NATION:

SIR: Friends of Chaucer will be interested in the appearance of a new comedy in verse called "The Canterbury Pilgrims," in which (we are told by the publishers) Chaucer is to appear "in the rôle of a lover of the Prioress whose motto *Amor vincit omnia* gave Chaucer opportunity to throw a spice of mischief into the picture he drew of the gentle little lady." It is interesting to find this suspicion of mischief persisting in this way, when it has long been known that Chaucer was describing a purely conventional ornament of the period, such as should have excited no uncharitable comment on the part of any but the most depraved Canterbury pilgrim.

For some of us, however, the matter is worthy of mention because it suggests a trifling but characteristic reminiscence of the late Professor Child, America's most distinguished Chaucer scholar. It is well known that Professor Child's incidental comments on questions of morals and manners formed no small part of the delights of his teaching; and he never hesitated to condemn a fault even in a favorite poet. Many of his pupils must recall his unflinching condemnation of Chaucer himself for the sly defence of plain speaking on the ground that

"Crist spak him-self ful brode in holy writ."

"A most unwarranted reference!" Professor Child would exclaim indignantly. "No defence at all, and quite unworthy of Chaucer." But on the other hand he was as ready to be indignant at those who accused the poet unjustly. In the very last year that he read the Prologue with a class at Harvard, the point was raised that some thought Chaucer meant by the "Amor vincit omnia" to insinuate that the Prioress was not as completely absorbed in heavenly things as was meet for a lady of her profession. The present writer recalls with vividness the look of the venerable teacher as he raised his head energetically from his desk, saying (with evident sincerity, yet by no means without appreciation of the humor of the question): "An outrageous suggestion! Chaucer never would have done such a thing, and there's not the slightest reason for thinking of it." It is pleasant to imagine Professor Child's comment on the imputation in the play which has given excuse for this bit of reminiscence.

R. M. A.

LELAND STANFORD JUNIOR UNIVERSITY, March 24, 1903.

PALGRAVE'S GOLDEN TREASURY.

TO THE EDITOR OF THE NATION:

SIR: Your correspondent "F. M." is in error in asserting that the figures in the "Index of Writers" in the 1898 edition of Palgrave's 'Golden Treasury' have no relation to the book. The numbers which follow each writer's name in this index are the serial numbers given to the poems in the collection. Thus, "ALEXANDER, William (1580-1640), 29," the first entry, refers to the poem numbered in the text XXIX.

But while the book is under discussion, it may not be out of place to refer to certain other pitfalls which it presents, and against which the reader is rarely warned. Many of the titles are of Palgrave's own contrivance, especially those given to songs extracted from plays and to sonnets taken from sonnet sequences. The reader is thus left to believe that Shakspere named his sonnet cix. "The Unchangeable" (p. 11), or that Sidney entitled "Astrophel and Stella," 84, "Via Amoris," (p. 9). Again, some of the pieces are only fragments from larger works, the extreme example being "The Song of David," by Christopher Smart (p. 164), where three stanzas are selected from a poem containing eighty-six. In this case, it is true, a hint is given to the reader in a note at the end of the book. Finally, there are silent changes in the words of the poems themselves. Lodge's poem, "Rosalind's Description," is given on pp. 12-13 with the title "Rosaline," and with several arbitrary changes in the text, which may be discovered by comparison with the same poem as printed in any modern edition of "Rosalind," from the Hunterian Club facsimile to the reprint in Cassell's "National Library," while the one change that is emphatically called for, the substitution of "empyreal" for "imperial" in line 2, indispensable to any understanding of the meaning, happens not to have been made.

The 'Golden Treasury' has become a classic—one would not wish to see it in any way altered from the form which Palgrave has given to it; but would it not be well for some future edition to make perfectly clear to the reader in what relation, apart from modernizations of spelling and punctuation, its texts stand to their originals?

W. STRUNK, JR.

ITHACA, N. Y., March 31, 1903.

"LIBRARIES" AND THEIR METHODS.

TO THE EDITOR OF THE NATION:

SIR: I find that I am being used by unscrupulous publishers as a sort of editorial

abstraction, and I wish publicly to protest.

A few years ago I was asked by the late Charles Dudley Warner to help him on "The Library of the World's Best Literature." I believe that such compilations may be very useful. I did my work there and was paid for it. A little later I was asked by Mr. Walter Jackson to edit another "Library of Literature," which was to be published by Messrs. Merrill & Baker of New York. I laid out a plan combining the topical and chronological arrangement of the selections; this was accepted by the publishers, and the compilation on the lines indicated was carefully and effectively made, mainly by Miss Ticknor and Mr. Forrest Morgan. The title-page assigned credit for "Introductions" by Donald G. Mitchell and Andrew Lang, but those gentlemen had absolutely no editorial direction. We were treated courteously and generously by the publishers; it was a legitimate piece of editorial work, and not to be ashamed of.

Some time afterward an attempt was made to increase the sale of this "Library." I need not go into particulars, for I know nothing of the circumstances or even the promulgators of the scheme. It was announced, however, that Richard Garnett of the British Museum, Léon Vallée of the Bibliothèque Nationale, and Alois Brandl of the German National Library were the sponsors for this new compilation of literature, and Dr. Garnett was credited with having originated the topical-chronological arrangement of the "Library." I immediately wrote to Dr. Garnett, asking him what authority the selling agents had for thus using his name. He wrote me a most courteous reply, entirely disclaiming the unwelcome distinction. Mr. Andrew Lang also repudiated any editorial connnection with the "Library." The new edition so elaborately advertised seems to have been practically the same compilation as that originally published, with possibly the addition of a few illustrations.

I have the honor of being President of "The Bibliophile Society," a private organization consisting of five hundred booklovers. We have published for private distribution among our members a nine-volume edition of the Odes and Epodes of Horace. We have in hand a reprint and partial reproduction of Major André's Diary, which a generous member of the Society, having purchased from Earl Gray at a cost of £1,200, has placed at our disposal. The mercenary commercial spirit is entirely wanting to our Society. There are no yearly dues, and the officers receive no salaries. The publications are offered to the members at cost. They are not even obliged to subscribe. Needless to say, the Society has had and is having remarkable success, as would be recognized if any one saw the list of members.

The publishers of this "International Library" now insolently seized the name of the "Bibliophile Society," and, in order to throw dust in people's eyes, claimed that I was one of their directors! It has caused me no end of trouble. No attention has been paid to my letters of protest, and I find that my only recourse is to apply for an injunction, an expensive protest.

This morning I receive a letter from Dr. Henry P. Bowditch, asking if I approve of the method of securing support for "the latest and most important publication" of "The International Library, Classics and Rare Manuscript Society," which had just been deluging him with circulars. I find that here again I figure among the Board of Editors which instructs the American Secretary, C. T. Brainard of No. 11 East Sixteenth Street, New York, "to secure a few individual testimonials," and offers Dr. Bowditch "a complimentary membership in this society."

As I said before, I am not at all ashamed of the plan which I originated for the compilation of the "International Library" or of its contents. For those who have little time for reading, such compilations are useful and instructive. But I confess to a feeling of indignation at the unauthorized use of my name, as having had any individual or collective part in any scheme for selling this or any other "Library." I belong to no editorial board (although I did last summer serve for a time with Mr. T. B. Aldrich, Dr. Van Dyke, and Dr. Mabie in revising "The Young Folks' Library"), and I sincerely hope that the many persons who have been (as I know to my sorrow) annoyed by the claims of these anonymous agents of the "International Library," will accept this disclaimer as final and conclusive.

NATHAN HASKELL DOLE.

"HEDGECOTE," GLEN ROAD, BOSTON, MASS., April 6, 1903.

"BLIZZARD," "JAYHAWKER," "UNCLE SAM."

TO THE EDITOR OF THE NATION:

SIR: May I ask, through your columns, for information in regard to the above terms?

In the *Virginia Literary Museum* of December 16, 1829, will be found the following: "*Blizzard.* 'A violent blow'—perhaps from *Blitz*, [Germ.] lightning. *Kentucky*" (I. 418). In 1834 Davy Crockett wrote: "I started down the edge of the river low grounds, giving out the pursuit of my elks, and hadn't gone hardly any distance at all, before I saw two more bucks, very large fellows, too. I took a blizzard at one of them, and up he tumbled. The other ran off a few jumps and stop'd; and stood there till I had loaded again, and fired at him" ('Narrative,' p. 152). In 1835 Crockett again used the word (in his 'Tour,' p. 16), but in a sense which was misunderstood by Bartlett, and which has proved a puzzle to lexicographers. An examination of the entire passage (too long to give here), and a comparison with the extract just quoted, show that in 1835 the word was employed figuratively as meaning a sort of extinguisher, a "squelcher."

No instance of *blizzard* has been recorded between 1835 and 1880, but the word is said to have appeared in its now familiar sense in a Dakota newspaper in 1867. Prof. Cleveland Abbe calls my attention to the first use of the word in the *Monthly Weather Review* for December, 1876, as follows: "The very severe storms known in local parlance as 'blizzards' were reported on the 8th as prevailing in Iowa and Wisconsin, where temperatures of —15° and —20° prevailed, with violent northwest winds and much drifting snow" (p. 424). It may be added that in the sixties and seventies of the last century what we now call blizzards were on the plains termed *northers*—a word which apparently originated in Texas, where (as applied to a north wind) it is found as early as 1838. I should welcome examples of *blizzard* in any sense previous to 1880.

The noun *Jayhawk* is apparently not recognized in the dictionaries, while the earliest recorded certain example of *Jayhawker* is 1861, and of the verb *Jayhawk*, 1866. The words, however, were used in Kansas as early as November or December, 1858, at which time they were applied to James Montgomery and his men, who, in retaliation for the atrocities committed on Free-State settlers by the "border ruffians," raided the pro-slavery settlers and their abettors from Missouri. Examples of the terms before 1859 are desired. Statements are current as to the existence of the terms in California, Texas, and Australia previous to their appearance in Kansas in 1858; but such statements have yet to be substantiated.

The story connecting our familiar *Uncle Sam* with an obscure citizen of Troy, N. Y., named Samuel Wilson, who died in 1854, was given in 1842 by J. Frost in his 'Book of the Navy' (pp. 297, 298). Frost undoubtedly got the story from some newspaper. As for *Uncle Sam* itself, the term first found its way into a book in 1816, but had already run a career in the papers for three years —from October, 1813. Curiously enough, the sobriquet seems to have been avoided by the "war-hawks," as those who favored the war with England were called by their political opponents. I am anxious to obtain an earlier allusion to the Wilson story than 1842, and examples of *Uncle Sam* before 1814. ALBERT MATTHEWS.

BOSTON, March 28, 1903.

ORANGE EATING.

TO THE EDITOR OF THE NATION:

SIR: While all the ways of eating oranges are pleasant, my most favored way is to eat the whole orange except (sometimes) the seeds. In this way the delicious rind, the juices, the pulp combining to make the fruit, are all made food, easily digested, at least by yours truly, G. W. T.

Notes.

Six of the seven volumes of Mr. J. S. Farmer's dictionary entitled 'Slang and its Analogues' have now been issued, and concurrently with the seventh will be issued a revision of volume one, which the editor frankly pronounces inferior to the subsequent volumes. This is not obligatory on subscribers to the entire work. Mr. Farmer's address is No. 18 Bury Street, London, W. C.

We read in the current Proceedings of the New England Historic Genealogical Society of Boston that Mr. J. Henry Lea, who is in a sense Mr. H. F. Waters's successor abroad, is preparing for publication through the Society a volume of abstracts of the wills that are registered in the Prerogative Court of Canterbury. It begins with 1620. The Society has been urged to petition Congress to print, for the sake of the genealogical details involved, the identifying papers of the Revolutionary pensioners.

Fred Lewis Pattee is editing for the

Princeton Historical Association, in a limited edition of 1,250 copies, 'The Poems of Philip Freneau, Poet of the American Revolution,' in three volumes; the first now ready, and to be had at the University Library. There has been no collection made since Duyckinck's in 1865, and that was not exhaustive. Mr. Pattee essays a chronological arrangement, which "is virtually an autobiography, and furnishes a commentary upon the history of a highly important era." Some of the matter is inedited.

Longmans, Green, & Co., in connection with George Allen, London, will shortly begin the issue of Ruskin's Works in 32 volumes, not to be had singly, and limited to 2,000 copies for Great Britain and America, printed from type. Paper and letterpress will be of the first quality. The rate of publication will be monthly. Much unpublished MS., including letters, will be incorporated in the text, which will be edited, with introductions, by Mr. E. T. Cook, in collaboration with Mr. Wedderburn, one of Ruskin's literary executors.

Charles Scribner's Sons will bring out directly Henri Cordier's revision of Yule's translation of 'The Book of Sir Marco Polo,' in the light of recent discoveries.

'Two Centuries of American Costume in America,' by Mrs. Alice Morse Earle, is in the press of Macmillan Co.

G. P. Putnam's Sons are about to publish 'The South American Republics,' by Thomas C. Davidson; 'Danish Life,' by J. Brochner; and 'Divinity and Man,' by W. K. Roberts.

Thomas Whittaker will have the American market for a new work on the history of the Nonjurors, by Canon Overton of Lincoln.

A. Wessels Co. announce 'A History and Description of English Porcelain,' by William Burton, and 'The Riviera,' by Hugh Macmillan.

A. E. Gallatin's monograph on Aubrey Beardsley will appear directly through Godfrey A. S. Wieners, New York. Two portraits and examples of the artist's work will accompany a catalogue of it and a bibliography of Beardsley criticism.

McClure, Phillips & Co. have nearly ready 'Deep Sea Vagabonds,' by Albert Sonnichsen.

In a time of haste it is half-refreshing to witness deliberation even in the reprint of a classic. Sir Arthur Helps's 'Spanish Conquest in America,' introduced and annotated by M. Oppenheim, and published by John Lane, began to appear in 1900; the second volume bore date of 1902, and now we have the third, with one more to come. So the original appeared in 1855, 1857, 1861. The editor's part, though unpedantic as respects the notes, has been painstaking and scholarly, but the conspicuous enrichment of the work has been in the maps superadded to those of Helps. In the present volume these number seven, two from Wytfliet (1597), one of the Ptolemy of 1562, one from Lorenzana's 'Historia de Nueva España' (1541), etc. At the front is a facsimile of Herman Moll's North America, 1710-12, in which the peninsula of Lower California shows as an island. The letterpress of this edition, though compact, is clear, and the enterprise is in all ways justified.

There is no reason, except usage, why the English Bible should not be reproduced and labelled among the admirable "Tudor Translations" of David Nutt. Few know that of the Authorized Version of 1611 there were two editions showing very extensive variations, one of the least of which has been made a sign of bibliographic distinction. In the last line of Ruth iii., 15, "he went into the city" reads one of the black-letter folios; and "she went," etc., the other and presumably later impression. Mr. Nutt has chosen for his series the "He Bible," and has shown a commendable independence in the reprint. The division into verses has been abandoned in favor of rational paragraphing without numbers; poetry is given in verse type; the chapter headings are transferred to the margin, whose original references are dropped, while its English renderings of Hebrew names are relegated to footnotes; interpolated words are not distinguished by italic type. The old orthography is retained. This is a laudable reconciliation of antiquarianism with modern needs and convenience. Volume one ends with Joshua.

A year ago we made mention of the 'Letters of Mlle. de Lespinasse' in Miss Wormeley's translation for the Versailles Historical Series of Hardy, Pratt & Co., Boston. These publishers, taking advantage of Mrs. Humphry Ward's exploiting the Letters for her latest novel, have just brought them out afresh in a thin volume of 342 pages. The reflected interest is thus likely to give them a far wider audience than they appealed to in more expensive dress.

An entertaining and not unprofitable book is 'The Witchery of Sleep' (New York: Ostermoor & Co.), in which Willard Moyer has collected an anthology of his subject, together with a discussion of his own. He is especially enthusiastic on the importance of a certain kind of mattress. His disproportionate zeal on this point appears strange until one notes the name of the publishers. The illustrations of famous beds and sleeping places deserve commendation. In addition to the poetical extracts from eminent authors, the volume includes "A Symposium of Sleep," being "a collection of sleep thoughts and expressions especially contributed." Mr. Chauncey M. Depew declares that "the man who can have a natural slumber every night the year round, of eight hours, can move the world." The opinion of George H. Daniels, chronicled in the margin as "N. Y. C. R. R. views," is: "Sleep, next to waking, I think the most wonderful thing in life." The absence of any testimonial to sleep from the Pullman Car Company indicates an unpardonable ingratitude.

Mr. John Bigelow's 'The Mystery of Sleep' (Harper & Bros.) is a book of a very different class. The second edition, now issued, is a revision and expansion of a publication of 1896 to such an extent as to make practically a new book of it. The writer's object is to expose some "popular delusions," including the belief that sleep is at most a periodical provision for the reparation of physical waste. He maintains that it is rather a suspension of our consciousness, temporarily interrupting our relations with the phenomenal world, and sheltering us from its distractions and fascinations, so that spiritual growth and development may be possible. His position is fairly expressed by the motto he takes from Iamblichus: "The night-time of the body is the daytime of the soul." Mr. Bigelow's arguments will not appeal to most readers as convincing, as far as his main thesis is concerned, but there is much in them to provoke wholesome thought. His remarks on the connection between sleep and the loss of mental balance will also repay attention.

Many an educational moral may be pointed from the 'Republic' of Plato, and no theory of primary education can afford to ignore it. In his 'Theory of Education in Plato's Republic' (Macmillan), Mr. J. E. Adamson, principal of the Normal School, Pretoria, makes a somewhat close application of Plato's theories to the aims and methods of primary and secondary education. The difficulty of gauging the value of Plato's educational curriculum for present needs arises chiefly from the fact that Plato never envisaged an educational process that should cease in the early twenties and be crowned with the final sanction of a degree certificate. For him the whole of life was an education, to be adjusted and pursued on certain principles that to us seem narrow enough because we are even farther from his Utopia than were the Athenians themselves. Mr. Adamson could add nothing in the way of illustration and exposition to Nettleship's essay on this subject in 'Hellenica,' which is frequently quoted in this little volume, though the more detailed commentary in Nettleship's 'Lectures' is not mentioned. Mr. Adamson's effort "to show how Platonic ideas may illuminate modern educational problems" is intended for primary and secondary school teachers, and fulfils its purpose well enough. In tracing the "thought-ancestry" of Plato, he should have mentioned the influence of Heraclitus, which, though it was by way of reaction, is undoubted.

Whether the reader of 'Lettering in Ornament: An Enquiry into the Decorative Use of Lettering, Past, Present, and Possible,' by Lewis F. Day (London: B. T. Batsford; New York: Scribners), cares for "lettering" or not, will be largely a matter of his personal needs in the past, as well as of his personal predilections. The probabilities are that this book will be used chiefly by the engravers and the architects' draughtsmen, and, indeed, that it is meant for them. It deals with European letters only, with "The Printed Page" in one chapter and with "The Written Page" in another; with monumental inscriptions, with conjoined letters, with monograms and cyphers; and in this way covers a very large part of the field of inquiry. Moreover, it appears that the author is in sympathy with the more delicate aspects of his subject, and speaks with a real enthusiasm of the charm of variety and of unexpectedness in the design possible to the utilitarian arrangement of letters. There are a great many illustrations in this book, some of them recording admirable pieces of old work; and not mere rows of letters, either, but pieces of architecture, majolica plates, jewels and implements, panels of carved wood, key-bows, painted tiles, any decorative art with which letters are skilfully combined; and some of those wonderful, engraved plates of the sixteenth century with the twining and interlaced scrolls such as were invented by Hans Sebald Beham and Israel Van Meckenen.

Professor de Sumichrast's translation of Théophile Gautier is now complete with four concluding volumes, of which the most

important contain the celebrated essays on Hugo and Baudelaire, and a version of 'Émaux et Camées,' by Mrs Agnes Lee. This last task, much the most trying in the whole work, it would be unfair to judge by any other test than that admitted by the translator, whose design is merely that of a fairly literal but occasionally free rendering, without any serious attempt at reproducing the facet-like glitter of Gautier's inimitable line. Of the editorial essays we may note the introduction to 'Jack and Jill' (Jean et Jeannette), which contains an interesting comparative study of the two comedies of Marivaux and Goldsmith that furnished the substance of the later tale.

That useful series, "Monographs on Artists" (Lemcke & Buechner), reaches its seventh number with J. Lohse's translation of Adolf Rosenberg's 'Leonardo da Vinci.' Like its predecessors, this is an admirable collection of illustrative material (127 prints) at a low price. It would have conduced to the reader's comfort if the numerous paintings and drawings erroneously or doubtfully attributed to Leonardo gave some indication of the fact in the explanatory note. This policy was the rather to have been followed in the present work because the English version is so unidiomatic as to be almost unreadable.

'A Woman's Hardy Garden,' by Helena Rutherfurd Ely (Macmillan), gives an exceedingly interesting account of a garden about seventy miles from New York city. The management of it, the selection of the plants, and their arrangement are all dwelt upon with sufficient fulness to make the little work a safe guide for amateurs. The photographic illustrations are charming, and possess great value from the unusual fact that they are dated as to the month and day. Throughout the book there are proofs that this garden-keeper has a mind of her own, and, for the most part, her preferences are based on sound sense and good taste. The volume is readable and instructive.

The 'History of Pre-Clusian Botany in its relation to Aster,' by Edward Sandford Burgess (New York: Torrey Botanical Club), is an exhaustive compilation of the innumerable references to the plants of the genus Aster from 400 B. C. down, two thousand years, to the time of Clusius, 1601. Professor Burgess appears to have examined conscientiously the references and descriptions of these interesting plants, noting especially what has been said as to their differential characters and their possible uses. In a study of variation, this compilation, if, as we believe, it is trustworthy, will be of value as indicating recorded changes in the plants. Owing to the fact that the older descriptions are, for the most part, crude and insufficient, the utmost discrimination must be exercised in utilizing such material. By the eye of a master, like Darwin, who could find golden grains even in the chaff of the most ephemeral newspapers, it is likely that the course of changes may be discerned in such a compilation as this. Professor Burgess has apparently done his work with care throughout.

'L'Inde d'aujourd'hui: Étude Sociale,' by Albert Métin (Paris: Armand Colin), if not the *ouvrage remarquable* of the publishers' enclosed advertisement, is at least a conscientious study of life in India in its artistic, social, and political aspects. As the instructions given by the "fondateur des bourses" lay most weight on the latter factors, it is to be regretted that so large a part of the volume should be taken up with the description of well-known monuments and the iteration of oft-repeated facts and ideas. In truth, the first half of the book might have been written without leaving Paris save for an occasional personal reflection on spectacles often noticed by other travellers. Chapters six to nine (the last) contain, however, much that is good, a student's well-weighed observations on the English administration, the native Opposition, the cost of living, and the condition of industries, with reliable statistics. Criticism of the administration is not spared, but the Opposition is not lauded as a band of disinterested patriots. Here and there an item is already rendered doubtful by later statistics. If we are not mistaken, the railways, said on page 211 to cost more than they earn, are now reported to be making more revenue. The fact that *l'Angleterre impérialiste* spends more than it gives, and cares less for India than when it was *l'Angleterre pacifique*, is well brought out; but M. Métin should not have allowed himself the pleasantry of repeating such nonsense as that on page 243, the idle slander of malcontent Bombay, to the effect that a town's taxes are raised when it sends a delegate to the Congress of Liberals. Owing to the increase in prison industries it has become native slang to say that a prisoner is *un homme aux tapis* (the original is not given). But the child labor in the carpet industries that have to contend with this prison labor! According to M. Métin all laws of inspection are a dead letter; English and Hindu alike regard them as a farce as applied to women and children, and valid only as applied to the merchandise. A child of six, toiling all day, scarcely earns six cents. But when her money is needed for Africa, starving India must work.

The cumulative Quarterly Bibliography of Books Reviewed in Leading American Periodicals, which is edited by George Flavel Danforth, librarian of Indiana University (Bloomington: Index Publishing Co.), completed its first volume last year, an octavo of 207 pages, in very open typography. Speaking for the *Nation*, which is on the list, we can say that it is more minutely indexed than is customary with similar enterprises. The publisher's name and the price of the book are commonly subjoined to the reference to the review.

The Bostonian Society's Proceedings at the annual meeting contains the President's address on the antiquities of the city, and a biographical notice of John Read, a distinguished lawyer and citizen of Boston in provincial days, which throws light on the life of the early part of the eighteenth century. We mention also an excellent copy of Paul Revere's famous hand-colored engraving of the Boston Massacre.

Mr. W. I. Fletcher's Summer School of Library Economy will hold its thirteenth annual session of six weeks at Amherst, Mass., from July 6 to August 14. Courses in French will also be available.

A correspondent writes to us: "In connection with the recent discussion as to the advisability of accepting gifts from donors whose wealth is ill-gotten, the following passage, taken from Miss Garnett's 'Women of Turkey' (vol. 2, page 226), will be possibly found of some interest":

"In a codicil to her will, Khamko [mother of Ali Pasha] directed that a *hadji*, or pilgrim, should be dispatched on her part to lay offerings on the tomb of the Prophet, and pray there for the repose of her soul. Such pilgrimages and offerings may, however, only be made when the expenses are defrayed with money lawfully and honestly acquired. And as it was found on inquiry into the estate of the late Veli Bey, Ali's ancestor, that the property to be sold for this purpose had been taken by force or fraud from a Christian, the pilgrimage was disallowed by the religious authorities."

—In the April *Harper's*, Professor Ely continues his researches among the abnormal developments of American economics and sociology with a study of the economic aspects of Mormonism. Their well-known industrial success he attributes largely to the Mormons' faith in their religious tenets, though he gives us to understand that their industrial superiority has been somewhat overrated. Their proselytes are not generally among the most vigorous and enterprising classes, and, were it not for their docility in following superior leadership, they would make but sorry work of it. In the work of irrigation for agricultural purposes he pronounces Greeley, Colorado, superior to anything found in Mormon territory. On the religious side he declares them strong in faith, but decidedly weak in spirituality, a combination which indicates low ideals and backward development. He makes the interesting suggestion that the growth of a desire for stylish living is in itself a strong curb upon the spread of polygamous marriage, since few men can stand the expense of plural marriage under such conditions. Brander Matthews writes again of Briticisms, which he defines as words, phrases, or usages generally accepted in the British Isles, or even throughout the British Empire, but not adopted in the United States. The definition may pass if the words "generally accepted" be not pressed too closely. Among various terms which he cites as sporadic British innovations are a few which may be met at home. There is nothing peculiarly British in the London *Chronicle's* assertion that Sir Martin Conway successfully *negotiated* a perilous pass in his explorations, for American college boys have been *negotiating* perilous curves in baseball and troublesome crises in similar lines of effort for some years past. Mr. Matthews will also find the term *historicity* familiar to many of his American readers in the same sense in which he quotes it from the London *Times*.

—In the April *Atlantic*, Charles A. Conant combats vigorously the popular conception that operations on stock and produce exchanges are simply forms of gambling. The function of such exchanges in securing mobility and divisibility of capital is clearly set forth, as well as the advantage to the investor in being able to know, from the quotations of the exchange, just what is the average opinion of large numbers of experienced men as to the value of any listed security at any given time. It is also shown that the existence of a large mass of salable securities tends to prevent panics in the money market, or at least to minimize their violence. Mr. Conant makes a convincing defence of the exchange system, though he perhaps minimizes the abuses to which he admits that it is liable. The num-

ber is particularly strong in its literary interest. Mr. Trowbridge continues the story of his life, dealing largely with Emerson and Alcott; Frederick W. Holls contributes a dozen letters from the Emerson-Grimm correspondence; Brander Matthews writes of the Makers of the Drama of To-day, and Alexander V. G. Allen presents a warm-hearted, though not undiscriminating, appreciation of the late Horace E. Scudder. It will be a distinct revelation to most readers, for Mr. Scudder was not the man to allow modern methods of advertising to be applied to himself or his achievements. Professor Matthews is distinctly optimistic in his consideration of the drama. We pass over into the new century, he thinks, with clear evidences of dramatic reinvigoration everywhere except possibly in France, and even France has playwrights of promise. To Norway, however, Ibsen carries the palm for actual achievement; other countries are simply advancing hopefully on the right road. The fertilizing principle at the bottom of this new dramatic growth Mr. Matthews finds in the great development of prose fiction during the past century.

—Mr. G. F. Hill of the British Museum has arranged and edited a useful compilation called 'Illustrations of School Classics' (Macmillan), most of the pictures and maps in which have appeared scattered through the volumes of "Elementary Classics," issued by the same publishers. To them he has added brief descriptions, as well as a good bibliography, in which teachers and students are told where to find the originals, with still fuller accounts of them. The aim of this book is to do for school classics in general (that is, for the classics read in English schools, a far larger list than that of which American schools can boast) what has already been done for Homer in particular by the album of Engelmann and Anderson. These illustrations, now that they are seen together, instead of in their former scattered form, turn out to be a very careful selection, and they ought to add much by way of inspiration and living interest to the texts and commentaries over which boys and girls are set to pore. While we still find among them some of the outline cuts of the style commonly used in American school editions, yet many are reproduced by photography (and some in color), a form which does far greater justice to the originals, and offers less of a temptation to the ever-ready pencil of our young barbarians. The descriptions in the letterpress are in general thoroughly accurate and trustworthy, but we have been surprised to find a curious theory advanced in that of the picture of the last day of Laocoön, taken from the Codex Vaticanus of Virgil (the illustrations from which, by the way, are in this book photographed from the recent papal facsimile, instead of from the old and unreliable engravings still reproduced in our school editions of the Aeneid). Here Mr. Hill suggests that as the name "Laocoön" did not appear over the head of the sacrificing priest "in a reproduction of this picture published in 1835," it may be a recent addition in the MS. A little searching in the Museum Library would have shown him that it appears in Bartoli-Bottari (1741) and in D'Agincourt (1823). The "Edition of 1835" is, no doubt, that of Cardinal Mai, and for faithfulness it by no means deserves what the Cardinal claimed for it. Perhaps he left out the word because he did not understand that in this one picture (as so often in ancient and in mediæval art) we have two scenes in the life of the same man; the first being his sacrifice of the bull, and the second the fatal attack made upon him by the serpents. This, at least, would be our explanation of the double occurrence of the name, although Dr. Nohlac believes that it was erroneously inserted in the first case, but, of course, not "recently."

—Apropos of Gen. Chaffee's remark, before the Methodists in New York, that he had met no intelligent Chinese who desired Christianity in the empire, and the discussion of "Christophobia," it does not seem to be generally known what the official attitude of the Chinese Government really is, and always has been, toward any foreign religion. So long as alien cults are confined to poor and obscure converts, China may be indifferent or even liberal, but in case of any growth which means power, it is far different. China has a definite state religion. It hardly admits of a doubt that Confucianism, which stands above all else for order, and has been the fundamental law of China for twenty centuries, is intolerant. China has never yet officially granted religious liberty in the public schools or examinations, or to men in official positions. As matter of history, the Chinese Government has often persecuted Buddhistic and Taoist sects, under the suspicion that their aim was dangerous to the principle of authority, and thus to the welfare of the state and society. Mohammedanism has held its ground only after bloody contests. The full story of the official persecution, and what might be called the Inquisition, in China, is one which some Western scholar should investigate and set forth. It is a curious fact that, after the outbreak of a sort of Populism in the eleventh century, and the entire reëxamination and restatement of Confucianism by Chu Hi, in the twelfth century, the new creed, or philosophical Confucianism, which has for over seven hundred years furnished the opinions of most cultivated men in the eastern half of Asia, became increasingly intolerant. In its tremendous reaction against the liberality and freedom of the Mongols, it reached the point of bigotry. In Japan, after the fall of the Ming dynasty, Confucianism, under the influence of the Chinese refugee scholars, became the official religion of Yedo, and was made the special engine of Government in keeping out all foreign creeds, cults, and science. It was directly responsible for the imprisonment, torture, and death of not a few natives who, through Dutch learning or otherwise, sought to change the moulds of social or political Japan.

—The truth is clearly brought out in an essay in English by Professor De Groot of Leyden University, published last year in the Report of the Oriental Seminary at Berlin, on the question "Is There Religious Liberty in China?" The famous author of the standard work in Dutch on the Religious Systems of China, a lifelong student of the official religion in China, is easily the first authority in the world on the subject discussed by him. In his remarkable paper he gives a survey of twenty centuries, showing what is the Chinese law against heresy and sects, naming also the victims of oppression and persecution. He makes Confucius and Mencius responsible for the outbreaks of persecution manifested in Chinese history. But it has been shown that while his facts reveal the true Chinese political point of view, yet the text of Confucius and Mencius, both of whom taught before the special teachings of the sage were incorporated into a policy of government, do not justify persecution. As Dr. Faber correctly translates the passage in the Analects (II., 16), it reads, "To fight strange doctrines is indeed injurious." Mencius said: "If one by force subdues men, they do not submit in heart. Force is not sufficient; but if one by virtue subdues them, they will with joy in their hearts submit, as the seventy disciples submitted to Confucius" (II., 1; III., 2). In order, then, to gain an intelligent idea of the real attitude of the Chinese Government and literati, apart from any sentiment, friendly or hostile, one must know the historical attitude of official religion in China, while the man of culture must discriminate between the true and original Confucianism and that of later centuries. It is almost self-evident that, until full religious liberty is granted, as it is in Japan, by the fundamental law of the land, the animosity between Confucianists and Christians will tend rather to increase than to decrease, possibly even to an outbreak greater than that of 1900. The principle of opposition to Occidental religion, backed, as to the Chinese mind it seems to be, by commercial covetousness and political greed, will always have the sympathy and connivance of high Chinese officers.

—Dr. F. Eulenburg, privat-docent in the University of Leipzig, has published in the *Jahrbücher für Nationalökonomie und Statistik* a lengthy article dealing with the age of the active full professors in the Universities of Germany, as also of the German universities in Austria and Switzerland. It is practically exhaustive, only about 2 per cent. of the complete data being wanting, so that it covers 1,288 professors for the winter term of 1890-91, and 1,429 for the winter term of 1901-02. According to these statistics, the average age of the full university professors at present is 53.4 years, which is two years above what it was a decade ago, when it was 51½ years. The highest average age is found at the ten Prussian universities, where it is 54.5 years, and the lowest average in the three universities of Switzerland, where it is 51.8. It is significant that the smaller universities exhibit a smaller average than the larger; this is explained by the fact that usually men do not gain an entrance into the faculties of the larger until they have been tried and found approved in the smaller. In different departments the average varies considerably. In the case of the 201 theological professors it is 54.2; of the 226 law professors, 54.2; of the 295 medical professors, 54.8; of the 707 men in the several departments of the philosophical faculty, 53.1. That the average among the medical men should be the highest is readily explained by the fact that the rush to this department is especially great, and that the number of assistant professors and privat-docents is very large. On the other hand, the law faculties have not been attracting so many candidates, and the chances for earlier promotion are accord-

ingly greater. The highest averages are reported from Berlin, Königsberg, Munich, and Leipzig; which can readily be explained in the case of the first, third, and fourth, as these leading universities are the Ultima Thule of the German savant's ambition. The youngest full professors are found in Bonn, Heidelberg, Vienna, and Strassburg, in the non-theological faculties, and in Tübingen, Marburg, Innsbruck, Erlangen, and Giessen in all departments. There are only two full professors under thirty, both in the law department, one in Tübingen, and the other in Bern. About 4 per cent. of the professors continue in the harness after they have passed their seventieth year, but it should be remembered that in Austria, as in the German provinces of Russia, professors are retired by law when they reach this age. Eulenburg suggests that the German states pass a law giving the incumbent of an academic chair the right to retire at the age of sixty-five with a pension, and making this compulsory, except in rare cases, at the age of seventy, but in each instance, in the latter case, making the incumbent Professor Emeritus and giving the "Lehrauftrag" to a younger man. This, he declares, would be justice to both students and professors. His discussion has an added interest when compared with the paper published in 1876 by Laspeyres on the same subject.

PRESIDENT KRUGER'S AUTOBIOGRAPHY.

The Memoirs of Paul Kruger, four times President of the South African Republic. Told by Himself. The Century Company. 1902.

These memoirs were (in 1901 and 1902) dictated by Mr. Kruger to his own private secretary, and to a former Under Secretary of the South African Republic; and were afterwards revised and brought into a more finished shape by a clergyman (Dr. Schowalter), who published them in German. Though the latter did this work in personal communication with Mr. Kruger during the latter's residence in Holland, the process has naturally taken away a little of the freshness which an autobiography entirely written or dictated by the old President would have had; and the English translation, being made from the German version, itself rendered from the Dutch original, stands at two removes from the *ipsissima verba* of the author. This circumstance slightly reduces the directness and raciness of the narrative, making it less characteristic of the man than the conversations which various persons have reported with him. Nevertheless, the book has its individuality, and remains a valuable record of the important events in which its author bore a part.

There is comparatively little of his private life in it; indeed, hardly any except some stories of hunting adventures in early days and of experiences in expeditions against the Kaffirs. There are very few reflections, and few descriptions of the life and society of the Boer settlers. No literary art has been employed, and one sees that the narrative flows from a mind that does not know what literary art is, and has not got that kind of imaginative quality which, in the absence of literary training, is nevertheless able to produce matter that appeals to the imagination or the emotions of the reader. Neither does the humor which Mr. Kruger undoubtedly possesses (for it emerges in the similes and illustrations he has often employed in his talk and his speeches) come much to the surface in this book, as may, indeed, be deemed natural when one remembers the circumstances of sorrow and depression under which the work was composed, in exile, after the news of his wife's death, and while hearing, day by day, of the events which heralded the overthrow of his country's independence.

The story begins with the youth's departure from the Colesburg district in Cape Colony, in 1835, when his father and his uncles left their farms to cross the Orange River into the wilderness, then almost unexplored, which lay to the northeast and was inhabited only by a few Kaffir tribes. The boys tended the cattle on the march, but were soon called upon to join in the fighting against the formidable chief Moselikatse, who attacked the emigrants and was ultimately driven by them far away to the north into what is now called Matabililand. Young Kruger took part in one of these military expeditions when only fourteen. When one thinks of the training given to a man's capacities by the kind of life these people led, fighting the Kaffirs in small parties (of course always against greatly superior numbers), pursuing such formidable wild beasts as the lion, the elephant, and the rhinoceros, all then abundant in a region whence they have since been exterminated, and striving against one another in their numerous public meetings and civil commotions, one is reminded of the life of the early settlers in Massachusetts, Virginia, and Kentucky, and one is not surprised that a training so stimulating and so varied should have produced the race of men whose military aptitudes and whose heroic tenacity have excited the admiration of the world during the recent war of the English against the two Dutch Republics. The citizens of early Rome and the Greeks in their great creative ages had similar experiences of war as well as of civil struggles—experiences one-half of which the modern world of Europe and the United States wants; and it is partly because the modern stay-at-home citizen does not know what the realities of war are like, that he shows himself so prone to the Jingoism of newspapers and music halls.

Mr. Kruger's public life began when he was elected a Field Cornet in 1852. This post, primarily military, carries with it civil duties also in the local government of South African States. Thenceforward he played a conspicuous part in all the wars and civil struggles of the Transvaal, being for a time Commandant-General in the days of President Burgers. In one expedition against the Kaffir chiefs Mapela and Makapaan, he had an adventure which displayed his fearless spirit. The Boer commando had driven the Kaffirs into some caves in the mountains, where they suffered severely from famine, but obstinately refused to surrender. Kruger, wishing to bring the siege to a close, crept in the dark into one of the caves where a large body of Kaffirs lay, and began to talk to them in their own language, suggesting that it would be better for them to surrender than to die of hunger, and offering to go to the white men to negotiate. Suddenly a Kaffir who recognized by the voice that it was not one of his own people who spoke, exclaimed "Magoa" (White man). Kruger gave himself up for lost, but at the cry all the Kaffirs rushed suddenly into the back of the cave. He followed them, and was not killed because in the darkness they could not distinguish the intruder. Finally, he again addressed them, simulating their accent, and succeeded in bringing 180 women and children out of the cave, himself remaining undiscovered till they had emerged.

In 1872, when M. W. Pretorius resigned office, some of the Boers wished to run Kruger for the Presidency of the Transvaal, but he refused to stand, though he opposed the election of Burgers, whose religious opinions he disliked, for Burgers was believed to be a free thinker, and Kruger has always belonged to the straitest sect of Calvinistic orthodoxy. When, in 1877, Theophilus Shepstone, a British envoy, acting on the discretionary instructions which the British Government had given him, proclaimed the annexation of the Transvaal to the British dominions, Kruger took a leading share in resisting this change; and was sent shortly afterwards to England, along with Jorissen, as a delegate from the Boers, charged to represent the unwillingness of the people to be annexed, and to induce the British Government to revoke Shepstone's act. The embassy failed, and the other Powers to whom the envoys went refused to interfere. Three years passed, during which the grant of self-governing institutions promised by Shepstone in 1877 was delayed. Then came the outbreak of December, 1880. Kruger was elected one of a triumvirate to administer the government of the reëstablished republic, and was one of those who signed the Convention of 1881, by which the British Government conceded a qualified independence to the Transvaal. In 1883 he became by popular election President of the Republic, and was reëlected in 1888, 1893, and 1898, so that from 1880 onwards the record of his life is practically a record of the history of that State down to his quitting it for Europe in 1901, when the English forces had occupied Pretoria. He departed at the wish of the Council, in order that he might endeavor to obtain some help, or at least some promise of intervention, from the European Powers.

The memoirs describe succinctly the chief events of those twenty troubled years, the wrangling with England over native territories, the negotiations of the convention of 1884, the various dealings with Cecil Rhodes, the discovery of the Rand gold field, and consequent inrush of foreign settlers, the visits of Sir Henry Loch, the British High Commissioner to Pretoria, the attempt to pacify the Uitlanders by the establishment of the Second Volksraad, the Johannesburg "Reform Movement" and Jameson Raid of 1896, the quarrel with and dismissal of Chief Justice Kotze, the Bloemfontein Conference of May, 1899, the negotiations with the British Colonial Office, and outbreak of war. About the course of the war itself little is said, for Mr. Kruger did not take part in the actual fighting, being seventy-four years old when the war began. It cannot be said that much new light is thrown upon all these transactions, of which the outline is, of

course, already well known to the public, and which have been repeatedly discussed in England with great bitterness. Severe reflections are made upon Mr. Rhodes, who is represented as the chief source of trouble, upon Lord Milner, and upon Mr. Chamberlain, but the language used is not violent, and there is less of passion than might have been expected from one whose feelings are naturally strong. Indeed, the narrative generally reminds one in its dryness of Cæsar's 'Commentaries'; and we get a more lively impression of the writer's personality when we turn to the speeches (printed in the appendix) delivered by the old President at his inauguration in 1898, and to the Volksraad or Legislative Chamber, on several occasions in 1899 and 1900. In the religious tone that pervades them, and in their constant references to Scripture, as well as in their clumsiness of style and their forcible sincerity, they remind one of some of Oliver Cromwell's discourses.

The Transvaal Boers have often been compared to the English Puritans of the seventeenth century, and Kruger is a typical Boer in his tenacity, his astuteness, his courage, his religious fervor, his indifference to all that savors of culture. As is natural, he justifies his own action throughout, yet with a quiet dignity which shows no sensitiveness to criticism. One admission of error he does make when he says (page 183), in referring to the complaints made by the mining population at Johannesburg: "Much exception has been taken to my attitude, and perhaps I should have been wiser had I shown more consideration for the feelings of the foreigners." He adds, however: "But we must not forget the elements of which the population was composed, nor the fact that a population of the same class at Kimberley had caused a rebellion which obliged the British Government to send a considerable force to hold it in check; nor lastly, that a former accusation of inherent weakness had cost the Republic dear. I was determined, therefore, to do all in my power to avoid a renewal of that accusation." He regards the memories of the annexation and war, and the gold fields, as the source of all the later misfortunes of the Transvaal. "The words uttered by the late Gen. Joubert, when a burgher came gleefully to tell him that a new gold-reef had been discovered, were prophetic: 'Instead of rejoicing, you would do better to weep, for this gold will cause our country to be soaked in blood.' "

Though it chronicles a long tragedy, the tone of the book is not tragic. Though it comes from the chief actor in events which may be described as great, because they have affected the general history of the world and have fixed the world's attention, comparatively small as is the theatre on which the action went on, it does not exhaust even Mr. Kruger's own share in those events. Some day a life of him will have to be written which will present more fully in the setting of its singular social environment a powerful character and a remarkable career. Even poetry may perhaps occupy itself with figures in their way so dramatic as Paul Kruger and Cecil Rhodes, the protagonists of the races which have for a century been intermingled, and too frequently opposed, in South Africa.

THE "UNKNOWN" AND THE KNOWABLE.—II.

Unknown Mexico: A Record of Five Years' Exploration among the Tribes of the Western Sierra Madre; . . . Tepic and Jalisco; and among the Tarascos, etc. By Carl Lumholtz, M.A. 2 vols., illustrations and maps. 8vo, pp. xxxii., 530, 496. Scribners.

It is nothing short of a calamity—perhaps it is even so bad as a blunder—when an adequately financed scientific expedition, headed and controlled by a man so sympathetic, so earnest and so observant, sets forth as if the world had been finished day before yesterday. It would not have been dangerous to know and note, once and again, that now the scene of the explorer's activity is just where the Nebomes gently entreated the very first transcontinental travellers in North America (Cabeza de Vaca and his comrades) in 1536; nor yet that another spot in focus is where that obliging Spaniard Nuño de Guzman, who hunted slaves as Spaniards are expected to do (and was punished as by law provided), made his human drive in 1530, and a bit later founded a city, which Mr. Lumholtz visited, precisely as a buffer between civilization and one of the "Chichimec" tribes wherewith Mr. Lumholtz was seriously concerned; nor that another locality explored is where fell that gigantic, prehistoric meteorite, so long famous in legend and record, first made known to us parvenus by the soldier-poet Villagran, in his 32-canto heroics on the Conquest of 1598; nor that over some identical trails trudged the first discoverer of Arizona, Fray Marcos of Niza, in 1539, with his historic darky, and next year again with Coronado's brilliant army going to discovery and exploration not only of New Mexico, but so far as Kansas; nor that these same tribes (the Tarahumares and Tepehuanes) figure notably in the little affair of the first settlement of New Mexico, and the founding of the second and third towns within the limits of the United States, by one Juan de Oñate; and that these are also the very fellows who "invested us face to face" as chronicled by Fray Alonso de Benavides, author (1630) of the rarest and most precious "source" on the early ethnography of the Southwest; nor that yonder the neo-discoverer trod the very landscapes which interest some people because there the yellow-haired hero of the "Salto" came to succor the beleaguered Cristobal de Oñate (discoverer of the first great silver bonanza in the world, save one), and there perished, in one of the most remarkable cliff-stormings in history—a chapter finished *in situ* by the greatest administrative genius America knew in the three centuries following Columbus. It is unlikely that even the casual subscriber would "stop his paper" for reference by name or fame to Alvarado, Los Tajos, Mendoza, or the Peñol of Mixton; or for finding, along with the author's comfortable shiverings at seasonal austerities of climate in the upper Sierra Madre, confession of the fact that so recently as 1554, during one of his Indian campaigns in this now "unknown" land, Capt. Francisco de Ybarra lost forty horses frozen to death. Even in acute *magazinitis* it is a business blunder to ignore the fascinating associations of history and romance in which—and in their most brilliant sort—the entire field of Mr. Lumholtz's labors is so enormously rich. From only the most "marketable" and readable of these, the two volumes might have been thick-studded; or as large and fully as salable a volume iii. easily added.

"Of most of these tribes but little more than their names were known." Of none of these tribes was *anything* known—to some people. To say nothing of their modern scientific classification by linguistic stocks, or of the vocabularies, numerously printed, scattering along down from the very generation of the Conquest, all these tribes have been Christianized since before Plymouth Rock. Michuacan was the very first *Provincia* of the Santo Evangelio in Mexico, being erected to that dignity in 1535. It had more Franciscan missionaries than any other *Provincia* (v. Mendieta), beginning in 1525. Its Father Provincial in 1539 was none other than Fray Marcos—a student of the Tarascos 365 years ago. It lacks less than six years of three full centuries since the "American cave-dwellers of the present age" were summarily and permanently husked of their primitiveness. In 1598 the people Mr. Lumholtz reckons practically unsophisticated by European contact, were recorded as "very apt in reading, writing, counting, and the catechism"—all of which it is not unfair to account colorably European. The clothing he pictures and describes was imposed by the Jesuits upon his "primitive tribes," which, when they *were* primitive, mostly went stark. One is tempted to quote gems from the multitude of witnesses that record—sometimes in delightfully human fashion—their clerical sufferings in modesty, and the seriousness of the task they had in teaching the Indians to "dress honestly." But it would take space. It is enough to quote, as to the Tarahumares and Tepehuanes, Fray Nicholas Arnaya, in the *Anua* of 1601: "andan desnudos"—they go naked.

The towns and pueblos the explorer dwelt, studied, and confided in—these were the reform work of the missionaries whom he has to thank that he found so beggarly an account of empty cave-dwellings. It is not sufficiently remembered how enormous a change in this particular was wrought by the Jesuits and Franciscans over a vast part of the continent—more than a million square miles. Even among the Pueblo Indians of New Mexico, our great example of sedentary cultures, a very extensive and important concentration of villages was brought about by the pioneer missionaries. In 1601 Mr. Lumholtz's Tepehuanes began to be gathered by the Jesuits from their "burrows" into towns. Arnaya specifies 2,000 of them already in that year centralized in one pueblo. By 1607 these same Indians had six missionaries; and 4,000 of them had been Christianized and diverted from their caves to dwelling in twenty pueblos. As to the Tarascos, by 1577 there had been only seven books that we know of printed in their tongue in the City of Mexico. The Sierra Madre proper has been a missionary field ever since 1645. Among the "unknown" Coras, Father Diego de Guzman began his apostolic labors in 1619; and, long before him, Father Arnaya was much in evidence. By 1752 the one State of Sonora, with which Mr. Lumholtz has much to do, had a little matter of twenty-nine missions, conducted in four aboriginal languages, and with generic "reduction" of the tribes from nomadry to formal pueblos. In the same year the Tarahumares had sev-

enteen Jesuit missions—and four notches on their stick of martyrs. And so on.

The report of still-inhabited caves to the northward was already old in Mexico at the Conquest; and, in its legendary form of the "Seven Caves" and Chicomoztoc, had much to do with the actual discovery of New Mexico and Arizona. It figures, for instance, in Motolinia (1540), Zumarraga (1547), and the 'Anales de Cuauhtitlan' (circa 1550). By the Indian historians Camargo, Duran, and Ixtlilxochitl, all before 1600, it is mentioned as a long-time tradition; and it is even referred to in the 'Popul-Vuh' of Guatemala. Closer knowledge began with the Conquest. In 1531, Espiritu Santo de Tepic was founded by Guzman as an outpost against the "Chichimecos" (not a tribe-name, but general for wild Indians) dwelling to the northeast; "a barbarous folk that live scattered in caverns and woods like savage beasts. They maintain themselves by the hunt and wild fruits. They make wine of certain roots wherewith they get themselves drunk." The *Anua* of 1596 speaks of a Tepehuan: "in a cave set amid crags, where he dwelt like a wild beast." The *Anua* of 1597, on the same locality: "Our Lord hath pleased to get them out from those caves and crags, which seem altogether inaccessible." On the same page: "Another spot, or, better said, habitation of wild animals, as they have their burrows *(madrigueras)* in the apertures of the cliffs." Again: the priest "sought them in their caves" and persuaded them to come down and form a pueblo. The *Anua* of 1601 mentions the Tepehuanes "in their peaks and ancient burrows." Torquemada, writing in 1610 his magnificent 'Monarquia Indiana,' tells of these Indians that they "had no Clothing, nor Houses, and contented themselves with only living in Caves." "There are many Caves, and Caverns, ordinary dwellings of the Chichimecos." Of the "Tepeguanes": "los mas bellicosos de la Nueva España." And much more. Ribas, in his important 'Triumfos' (Madrid, 1645), quotes Father Juan Fonte on the Tarahumares in 1608: "The dwelling of much of the people is in caves, which are many in their land, and some so capacious that in one live a whole kindred *(parentela)*, making their divisions of little houses within." The book of burials of the mission of Bacadehuachi, 1655, records the killing of the people of the Sierra Madre in their cave-dwellings by raiding Janos and Jocomes. Tello, 1653, mentions their sacred caves (p. 775 of his 'Conquista . . . de Xalisco'). And so on. Incidentally, in the weighty Final Report covering his travels in the Sierra Madre in 1883-84, Bandelier notes (II., 521) "the well-known fact that part of the Tarahumares dwelt, and dwell to-day, in caves."

The Peyote-cult and ceremonial intoxication are indicated, for example, in Herrera (1601), Torquemada (1610), Ribas (1645), Tello (1653). In the *Anua* of 1598 the Demon Cachiripa is said to have ordered these Indians to "make Mitotes (dances) wherein they intoxicate themselves and take the Peyote." Vetancurt's rich 'Teatro Mexicano' (Mexico, 1698) furnishes a possible clue to the puzzling name Mr. Lumholtz gives the Peyote. Along with the latter plant, Vetancurt mentions its variety the "Ololiuhqui, which means 'round leaf,' also called Coaxihuitl, which is 'snake-herb.'" "This is esteemed by the Indians because the Priests of their Idols used to take it to receive the answers to their doubts." And again: "Peyote, Root of the Peyotl. Although the natives esteem it, the Spaniards abhor it as Superstitious, since the Indians are wont to take it for divination and to know the occult in dreams. It is mixed with Zacazili and Ololiuhqui. They take it that they may not feel weariness." A century earlier yet, in his famous 'Historia Natural y Moral,' 1590, Acosta mentions that "when they would see visions they take Oliliuhqui." The famous 'Apostolicos Afanes,' otherwise 'Historia del Nayarit' (including Sonora and Sinaloa), 1754, in describing one of the ceremonial dances about as clearly as Lumholtz does, and the musical bow with it, says: "They put close there [to the master singer] a bowl full of Peyote, which is a diabolic root that they drink ground, that they may not droop under the lassitude of so long a function." That classic of Sonora, the 'Rudo Ensayo' (written in 1761-2), describes the native drinks, of which "the worst is the Sauco, on which they get drunk for three and five days at a time." The 'Estado de la Mision de San Lorenzo . . . de Zumas' (MS. about 1750) tells of these Indians (the people of the Casas Grandes): "It is a folk given to intoxication; and the worst is not that of wine and aguardiente, but that of the herb they call Peiote. This transports them in such sort that it renders them mad. It is among them a mystic herb, and they use it in their religious gatherings." It is of course needless to refer to Bandelier's characterization of this herb, or to the familiar historic fact that it was also employed by the Pueblos of New Mexico to produce wilful trances; and that its use was prohibited, centuries ago, by the Spanish authorities.

The sacrifice of arrows? Even Castañeda, the dyspeptic member and scribe of Coronado's expedition in 1540, mentions them in the Sierra Madre; as does the 'Apostolicos Afanes' of 1754. The peculiar cult of deer and their heads? It is in the *Anua* of 1598; to say nothing of that of 1607, 'El Nayarit' in 1754, etc. The musical bow is frequently mentioned by early sources, at least as far back as the *Anua* of 1598. So is the rain-dance, and with no little particularity—as in the 'Rudo Ensayo,' and in the anonymous Jesuit letter of 1658: "a dance truly diabolic, which they call Torom-Raqui, to procure rain." The shamanism is very reasonably described in Vetancurt, Herrera, Torquemada, Tello, 'El Nayarit,' Ribas, the 'Rudo Ensayo,' the *Anuas* of 1596 *et seq.* And so on to a tiresome list. Even the ability of the sorcerers to change themselves to animals—so familiar to folklorists throughout the Southwest—is detailed by the first historian of America, Oviedo, 1535; by Mendieta, writing in 1596; by Herrera, 1601; and innumerable others, as by Ribas 258 years ago, with the further coincidence with Lumholtz that these Indians called their fetishes "abuelos" (grandparents).

The almost ubiquitous aboriginal mode of "healing," by a sleight-of-hand "sucking out" from the afflicted part the stone or thorn or other foreign substance supposed to cause the disease, has, of course, been familiar to scholars ever since Cabeza de Vaca took his involuntary medical course *ante* 1535; and is so innumerably described in the old sources—and in some of them so well—that there seems no need to quote. Even in so fragmentary a matter, it is of interest to note that the marriage custom mentioned by Lumholtz among the Tarahumares (I., 270), and the Huicholes (II., 94), has prior explication in the 'Cosas' of Sahagun (II., 270) who died 1590; in Mendieta (1596); and in other sources (not forgetting the 'Estado de . . . Sonora,' 1730), wherein is described the aboriginal tying up of the bride and groom in their two *petates*—a ceremonial of which he has fallen upon the dwindled relic. Generally, in reporting such things as "mountain-worship," it would be worth while to give a reference hint of the *apachetas* and other features of this well-developed cult in Peru and our Southwest. It surprises the initiate reader—and deprives the uninitiate—to find no reference from the rattlesnake cult (of which Mr. Lumholtz mentions traces) to the extraordinary ophism once common to all the Pueblos, and still so notorious among the Moquis; or from the ceremonial races of the Tarahumares to the closely related *Juib* of the Pueblos—particularly as a specified object of the trip was to "shed light upon the relations between the ancient culture of the valley of Mexico and the Pueblo Indians." In these volumes, at least, that opening promise seems to have been forgotten altogether. The making of "a kind of beer called in Mexican Spanish tesvino" is described, and the extensive ceremonial use of this drink of fermented corn has much attention, but no correlation. It is, of course, the well-known "tizwin"—accompaniment and "bracer" of Apache outbreaks. Its general name "in Mexican Spanish" (as well as in Peru) is *chicha;* "texgüino," as it is properly spelled, being a provincialism of Sonora, Chihuahua and Sinaloa. The author's "shirgo" is an Hidalgo local word, of Otomi parentage, and written "xirgo." "Macuchi" is not exactly "as tobacco is called in Mexico," being a rather limited Coahuila term.

A critical knowledge of Spanish—particularly as to its historic readjustments and enrichments in the provincial Americas—would be to the explorer in these lands not only a living spring of recurrent delight and suggestion, but a safeguard in many sorts. Mr. Lumholtz has by pure pains avoided more pitfalls than one would have expected, but finds some needless ones. "Vecinos," which he uses with frequency, and always translates "neighbors," has indeed this meaning, but, in the relation in which he encounters it, is a specific word. The people of a town, and not their neighbors, are its "vecinos." Again: "The regard the Indians have for their Mexican masters is shown in the name by which they refer to them—Coyotes" (II., 330). What it "shows" depends somewhat on one's eyesight. Coyote, indeed (Aztec *coyotl*), is now universally familiar among us for the "prairie-wolf"—though we ordinarily butcher it with almost any other pronunciation than the correct co-yó-te. But his Indians were not calling the Mexicans "wolves" nor "dogs." For centuries the word has been in common use in Spanish America as an adjective, meaning native, *del pais*, or sometimes wild in the cognate sense—as we say "wild currants." The common expression "Indio coyote" is not "wolf-Indian," but merely native In-

dian—and in his native state. The "Criollos" (from which our "Creole," often as ignorantly abused), or people of Spanish parentage born in America, were often called "Coyotes," not contemptuously, but in this ancient sense; and *xocoyote* was the regular Aztec term for the youngest child—a word still current and an endearment (as *pet* child) in old California families.

Eminently absurd is the etymology attempted for "Papasquiaro" (Papáscuaro). "The name possibly means *paz quiero* (I want peace), alluding to the terrible defeat of the Indians by the Spaniards in the seventeenth century, . . . the uprising of 1616." There is no such possibility, linguistically; and in fact the town was founded by the Jesuits by 1597 in the valley of that aboriginal name. The author's place-names sometimes limp, but perhaps not elsewhere so seriously. It is late for sober praise of "the Aztec Empire"; and a pity to lose that fine Mexican Indian, Fray Diego Duran, who died in 1598, but left us two big tomes of aboriginal history, in "Diego Duran, a Spanish missionary." "Chilicote" (I., 440, etc.) is a blunder meriting not so much reprobation as gloss. So far as we recall, this not uncommon word has not yet found its deserts in any dictionary. The Century gives it "Chilli-Coyote"—a monstrous absurdity, yoking pepper and the coyote. The Standard does not give it in any shape; and among such American writers as use the word it is almost invariably distorted beyond all hint of its parentage and real meaning—as, "Chilicote," "Chilicothe," "Chili-Coyote," "Chili-cajote," and many more. The word has nothing to do with chile or coyote. It is Chilacayote, from the Aztec *xilacayotli*, compound of *xilotl* (young ear of corn) and *ayotli* (gourd). The plant is of the gourd family, and the name is used in the Southwest and in Mexico for several varieties—otherwise called megarrhiza, cucurbitus lagenaria, echinocystis, wild cucumber, big-root, bottle gourd, and what-not. Vetancurt ('Teatro Mexicano,' 1698) writes it Zilacayote, and mentions other gourds of related name, as the Tlalayote.

Utter worthlessness of the index cannot be too strongly deplored in a work of this character. Not only does this omit the important aboriginal terms which have become part of scientific nomenclature and are particularly vital for reference here—as mitote, Tequila, jacal, Nayarit, vecino, tarima, chuchupate, and the like—it does not even enter birth, marriage, or death customs, races or running, medicine, etc., nor yet Peyote, the most considerable single word in the book. The illustration is liberal, and the items in color are very good. There wholly lacks, however, any such ethnographic portraiture as Professor Starr's example (also in Mexico) has made the privilege and rather the duty of other students. The vice of redrawing photographs into "artistic treatments" is particularly out of place in books whose pictorial responsibility is less to decoration than to truth.

FOUR BOOKS ON MUSICAL TOPICS.

Musicians' Wit, Humor, and Anecdote. By Frederick J. Crowest. Scribners.

Reminiscences, Musical and Other. By Fanny Reed. Boston: Knight & Millet.

Orchestral Instruments and their Use. By Arthur Elson. Boston: L. C. Page & Co.

Johann Sebastian Bach, the Organist, and his Works for the Organ. By A. Pirro. Schirmer.

The eccentricities of genius are nowhere more abundantly illustrated than in the realm of music, and it is therefore easy to compile a readable volume of amusing traits and anecdotes. Nearly a quarter of a century ago Mr. Crowest brought out two bulky volumes of musical anecdotes. They were soon out of print, despite the prohibitive price. They have been recast and enlarged for the present issue, which is practically a new book; and illustrations have been added by J. Philip Donne. There is no attempt at classification, and it cannot be said that the compiler has always been mindful that brevity is the soul of wit. His own attempts at humor are pitiable, and his knack of spoiling a story by the manner of telling it is manifest in the case of Chopin at the dinner party. Being asked to play, the musician replied, according to Mr. Crowest, "Ah, Sir, I have just dined; your hospitality, I see, demands payment." What Chopin really said was, "Ah, Madam, I have eaten so little." Mr. Crowest talks of "pandering to the taste of the *vox populi*," and does other queer things; but he partly atones for them by his industry, which has enabled him to bring together some of the best of the old stories and some new ones. We get a glimpse of Beethoven "at home" through extracts from his diary: "The cook's off again—I shied half-a-dozen books at her head"; of Gluck, who, when asked by Marie Antoinette how his new opera "Armida" was getting along, replied, with the usual modesty of musicians; "Madame, il est bientôt fini, et vraiment ce sera superbe"; of Handel, who remarked to his prosperous publisher: "My dear Walsh, as it is but just we should stand upon an equal footing, you shall compose the next opera and I will sell it"—and so on.

A woman who has sung for, and been on friendly terms with, Liszt, Massenet, and Paderewski, not to speak of Paul Déchanel, Benjamin Constant, Munkacsy, Coquelin, and King Edward VII., has reason to write her reminiscences, as Fanny Reed has done. Her opening chapter gives us glimpses of war time. She sang a battle hymn on the Fourth of July, 1864, at the American Embassy in London. Some time later she met the Prince of Wales at Cowes, and sang for him. After an interval of eight years she again met him, when he asked her if she remembered singing for him one evening at Cowes, and showed his "truly royal memory" by mentioning the names of all the songs he had heard on that occasion. Liszt she first met in W. W. Story's rooms in the Barberini Palace. "All Rome is talking of your voice," he said to her, on being introduced. She sang an aria from "Le Prophète," and he accompanied her on the piano. He, too, had a royal memory, for when, a few years later, she again met him and wondered whether he recalled her, he went to the piano and began playing the Meyerbeer aria she had sung on her first visit to Rome. He taught her some of his own songs, then new. In describing his appearance at the piano, the author says: "I remember being in after years greatly struck with the resemblance of Mme. Wagner's eyes to her father's—clear, bright, piercing, and full of intelligence." She also met Liszt one evening in Paris. "When he came into the room, every one rose, as if at the entrance of royalty." In Paris she also witnessed the first triumphs of Paderewski. Concerning his appearance at the piano, she says that he, while playing, "from time to time lifts and drops his eyelids in a dreamy way, showing two wonderfully sad eyes full of pale blue light, with an expression seemingly oblivious to everything about him." In the final chapter the writer expresses the opinion that those for whom American life has been too strenuous may find in Paris the "rest and harmless diversion" so much needed by them.

Arthur Elson's book on the orchestra gives a description of each instrument now employed by civilized nations, a brief account of its history, an idea of the technical and acoustical principles illustrated by its performance, and an explanation of its value and functions in the modern orchestra. All this the sub-title tells us, and the promises made therein are redeemed not only conscientiously, but entertainingly. One can enjoy a good orchestral concert without knowing the names of the instruments, but every frequenter of concerts must feel interested in the sources of the sounds heard; and the more he knows about them, the more he will be able to realize a composer's ingenuity or genius in clothing his thoughts in appropriate colors. There have been combinations of instruments at all times, but it has been only gradually (since the sixteenth century) that musicians have learned to group them together intelligently, and to make each speak a language of its own. The greatest masters of this art were Schubert and Weber, Berlioz, Liszt, and Wagner. Mr. Elson would hardly, on sober second thought, defend his own assertion that Richard Strauss is "the greatest of all orchestral writers." Apart from a few rather cheap realistic tricks, there is very little in his scores in the line of coloring that was not anticipated by the five composers just named; and as for polyphonic complexity, none of Strauss's scores compares with the last acts of "Siegfried," "Tristan," "Götterdämmerung," and "Parsifal." Nor can we echo Mr. Elson's assertion that "Beethoven stands out as the foremost figure in musical history." He is the greatest writer of symphonies, no doubt, but in all other branches he has been surpassed. In orchestration he is inferior to half a dozen others, and it is not true that there is "hardly a passage in all his scores which would be improved by any change." If Schubert, Liszt, or Wagner had orchestrated these symphonies, they would be more beautiful even than they now are. But these are details; Mr. Elson has written a book admirably suited to the needs of music lovers. He makes the violin, the oboe, the clarionet, the horn, the trombone, etc., as interesting as if they were living persons. One of the odd and inexplicable facts mentioned by him is that the fathers of the New England Church in the eighteenth century approved of the violoncello, and paid a player as much as $70 a year, "while regarding the violin as a device of Satan, and the organ as the most utter abomination in the eyes of the Lord."

If there is one book which every organist ought to have it is Pirro's 'Johann Se-

bastian Bach, the Organist, and his Works for the Organ.' Wallace Goodrich has made a readable translation of it, and there is a valuable preface by C. M. Widor, the eminent French organist and composer. Bach is probably as un-Gallic as a man could possibly be; yet some of his most ardent and intelligent admirers (including Saint-Saëns) are Frenchmen. Pirro's book will add many to the number. Widor gives the history of the Bach cult in Paris, which began sixty years ago. He treats at length of Bach's technic as a virtuoso, and makes an interesting comparison between the organ and the orchestra in the matter of expression. While denying that the organ is capable of as much expression, he holds that it is "the only instrument which can prolong the same volume of sound indefinitely, and thus create the religious impression of the infinite." The art of organ playing, he says, has not changed since Bach, but our organs are growing distinctly better. As for M. Pirro, he prefaces his able and useful analysis of the organ works with a reference, which is hardly an exaggeration, to "the man who suddenly surpassed all that had been done before him, while at the same time anticipating all that was to be written in the future." His declared object in writing this book is to make it easier for the student to play Bach "in the Bach spirit." There are also short sketches of Bach's predecessors and of his life, besides an appendix containing a catalogue of his complete works as printed in forty-six volumes by the Bach Gesellschaft.

Horace Greeley, Founder and Editor of the New York *Tribune*. (Historic Lives Series). By William Alexander Linn, author of 'History of the Mormons.' Illustrated. D. Appleton & Co. 1903.

That Mr. Linn was connected with the *Tribune* for a time, as a member of its editorial staff, is not an important factor in his life of the great *Tribune* editor. The wonder is that he was taken on, considering Greeley's rule, "Horned cattle and college graduates need not apply," for he was just out of college. If there was much intimacy between him and his chief, there is little indication of it here, but he writes with the ease and confidence of a man widely familiar with the facts of Greeley's life and with his political environment, and not with the timidity of one who has crammed himself for a piece of writing foreign to the habit of his mind. There is scant endeavor to analyze the qualities which constituted Greeley's character from the biographical psychologist's point of view. The nearest approach to anything of this kind is the fifth chapter, "Sources of the *Tribune's* Influence." For the rest, who will may hear the interesting story told, and discover for himself, as best he can, how Greeley's character was made up.

Taken as a whole, the book has a circumflex movement. More strictly speaking, Greeley's character as the book displays it has such a movement. It mounts by painful stages from his birth and early childhood in New Hampshire, his boyhood and apprenticeship in Vermont, his first discouragements and successes in New York, through his various experiences as editor and publisher with the *New Yorker* and other papers, to the establishment of the *Tribune*, and still mounts for a dozen years or more with the steadily increasing influence of the paper which was to him his best-loved child. Even while it mounts, there are intimations, more and more pronounced as time goes on, of those defects which gathered strength during the two closing decades of his life. We receive the impression that his was a nature for which the uses of adversity were sweeter than those of prosperity; that the politician subordinated the reformer more and more as he advanced in his career, and that political ambition got the better of his generous social aims; and in general that decadence was the most characteristic note of his personal development once he had made the *Tribune* a first-rate political force. But even as the ascending series of his years had intimations of his ultimate decline, the descending series knew much of fine insurgence and eruption of the man's better self. The main effect is not exhilarating but depressing. It is made more so by the contrast of the later with the earlier period. It is as if Mr. Linn had painted-in a luminous background for a figure of pathetic and even tragical significance.

There is praise for Greeley's *Tribune* as a good newspaper, and there are stories of heroic feats accomplished by his reporters, while still one cannot but wonder whether it was worth while to spend so much energy and horse-flesh to bring a Governor's message from Albany to New York a little quicker than the other papers did. Greeley's "isms" are viewed as sources of his strength. A chapter on the tariff is the shortest and least satisfactory in the book. That on Greeley's part in the anti-slavery contest is much better, and exhibits his moral detestation of slavery as generally subordinate to political considerations. His preferring of Douglas to Lincoln in 1858 and after is barely touched. His relation to the civil war exaggerates, quite certainly, the sillier side of that relation, which nevertheless went far to justify the sentiment of Garrison that he was "the worst of counsellers, the most unsteady of all leaders, the most pliant of all compromisers in times of great public emergency." Mr. Linn tells a shocking story of a brutal editorial assaulting Lincoln which Greeley wrote the day before Lincoln's death and would have printed the day after; but his authority permits us to doubt the truth of it. Greeley's Presidential campaign was a tangled skein of worse and better elements. Grant's opponents had a good cause, but the injection of Greeley into it was fatal, resulting, as it did, from a triumph of political chicanery. He should have known and heeded the advice of Sir Thomas Browne: "Pursue virtue virtuously." Dreadful the penalty of his absurd ambition—an untimely death and with a broken heart. The pity of it, for the erring man was fundamentally a child.

The Poets of Transcendentalism: An Anthology. Edited by George Willis Cooke. With introductory essay and biographical notes. Boston: Houghton, Mifflin & Co. 1903.

That unwearied and accurate literary laborer, Mr. George W. Cooke, has published a book which aims to contain examples of the poetry of the American Transcendental period, or, more strictly speaking, of the type of literature swayed by the Emersonian influence. So marked was this influence, and so interesting the period, that the existence of this manual justifies itself; and it is peculiarly timely amid the general recognition and prospective celebration of Emerson's hundredth birthday. The obstacles in the way of such a competition lie chiefly in deciding which literary men of a period fall really within a certain influence, and, furthermore, in determining the point where that influence could be said to wane.

It is obvious that all writers in Emerson's *Dial* might fairly be included, yet it is doubtful whether the few sonnets published in that magazine by Lowell quite justify the prominence here given him, as second to Emerson only. Among the younger writers of the book, it might perhaps be doubted whether Sill, Burroughs, and others were quite to be classed with the Transcendental or Emersonian authors. Still, it is difficult to draw the line, and it could scarcely be better done, on the whole, than has been done by Mr. Cooke. We note with some surprise the omission of the late Octavius Brooks Frothingham, whose fine hymn, "The Children of the Cross," has secured a place in the hymn-books. We note, also, the usual want of uniformity in designating the name of married ladies among Mr. Cooke's authors. For instance, one of the most valuable features of the book is the fullest collection we have ever seen brought together of the remarkable poems of Ellen (Sturgis) Hooper, which ought long ago to have been printed in a volume; but her middle or maiden name is omitted, as also in the case of her younger sister, Caroline (Sturgis) Tappan. Mr. Cooke says in his notes of this lady: "She was called 'The American Bettine,' probably because of a poem she printed in the *Dial*." But this did not proceed from any single poem; it grew rather from a general parallelism of gifts and habits between her and that German child of genius whose correspondence with Goethe was then very widely read. On the other hand, Mr. Cooke prints the maiden name of Mrs. Julia Ward Howe, as is usual, and follows the too common practice of assigning to Mrs. Helen Jackson a name which she would peculiarly have disapproved, by introducing the patronymics of both of her husbands and making her appear as Mrs. Helen Hunt Jackson.

These, however, are mere technicalities, the essential thing being that Mr. Cooke has done well to bring together work purely and originally national; and quite as distinctive, for instance, as that of the Lake School in England. Perhaps in some instances, as in that of Mrs. Helen Jackson, the editor has selected too exclusively the religious poems, but he has in general shown excellent taste and judgment. The closing paragraphs in the introduction, in which he views the so-called Transcendentalism from the point of view of the present day and shows its limitations, are exceptionally just.

English Pleasure Gardens. By Rose Standish Nichols. The Macmillan Co. Pp. xxii., 324. 11 plans, 300 ills.

Surely there was no burning need of another history of gardening in England, yet so strong is the Englishman's love of gardens and so great his wealth of admirable

examples, that it is small wonder the tale is repeated. There is at least some excuse for it, since such exhaustive treatises as the one prefixed to Loudon's Encyclopædia (1834), or the still older history by George W. Johnson (1829), are rarely seen, and not quite what one wants nowadays. Were it not for the altogether excellent 'History' by the Hon. Alicia Amherst, which appeared some eight years ago, Miss Nichols's book would have filled an actual need, and would have been a more original contribution to our garden knowledge. As it is, it follows very closely the method of Miss Amherst's book, and produces, as a whole, a marked impression of similarity—an impression which, however, is scarcely confirmed by an examination of the book in detail.

It is a far cry from the English garden of the twentieth century to classic pleasure grounds, yet from the Greek and Roman garden, by way of the Romano-British garden, Miss Nichols would have us think our modern formal garden derived. And it may be that some of its general arrangements come from classic precedents, but one would rather suspect those precedents of having been transmitted through the Renaissance in Italy and brought over the Alps at a later day, than of having survived through the dark ages from a time when the ancient Romans themselves carried them to the far-away island colony. Be this as it may, Miss Nichols manages to descant very pleasantly for half a hundred pages upon classic pleasure grounds and their somewhat remote relation to the subject. Her chapters on "Monastic Gardens" and on "The Mediæval Pleasaunce," which are delightfully illustrated by reproductions of miniatures from a fifteenth-century manuscript of the 'Roman de la Rose,' serve to bridge a long gap, and bring us to the firmer ground of "Tudor Gardens." Of such gardens, although the remains may be scanty enough, we have accurate descriptions and a very complete idea, but it is when we reach the "Elizabethan Flower-Garden" that we begin to find (in spite of the destroying hands of two centuries of landscape gardeners) examples which show with certainty the very kind of gardens described in Sidney's 'Arcadia,' "not fairer in natural ornaments than artificial inventions." The story carries us on through "The Garden of the Stuarts," past the time of French and Italian influence, through the days when the landscape school carried all before it, and down to the revival of formal gardening at the present time.

The book deals not alone with garden design, but with the influences, political or social, that make the garden in any age an expression of the life and thought of the people; with the herbs and flowers and shrubs and fruits that grew therein; with the old herbalists and their wise saws; and with those who made gardens in England or wrote about them from Tacitus to Tennyson.

Mediæval French Literature. By Gaston Paris. Translated from the French by Hannah Lynch. (The Temple Primers.) London: Dent & Co.; New York: Macmillan. 1903.

This little book possesses a sad interest as the last by Gaston Paris. In a measure, it reveals the sources of his strength: his wonderful erudition, his broad outlook, his good judgment, his perfect honesty, his orderly and philosophic mind. A scholar without reproach, possessed of extraordinary knowledge gained by a lifetime of earnest devotion to a subject that he loved, an expositor of singular skill, Gaston Paris was fitted, as no one else has ever been, to write a monumental history of mediæval French Literature. Would that he had lived to perform this task on the large scale which he conceived. The "cyclopædic primer" before us is an excellent compendium of fact, arranged systematically, with due proportion and admirable perspective; but it is too succinct an account to show the master at his best. The plan of the series allowed him little opportunity to reveal the imaginative and literary power so richly his. Perhaps he held himself in too strict restraint. Will his death in the fulness of his power serve to remind others who likewise have much to impart, of the danger of delay in attempting to fulfil their cherished hopes?

The translation of the primer is, we regret to say, painfully inadequate. It is merely a bit of hackwork, always mechanical, often absurd. A glance at the proper names (they are written every which way) would alone suffice to prove the translator's incompetence. Nevertheless, those who cannot use the 'Manuel' in the original must be satisfied with it as it is. Though brief, and too informative for easy continuous reading, it will be found to be the most perspicuous as well as comprehensive and authoritative survey of French literature, from its earliest beginnings to the Renaissance, that is now accessible to English readers.

So fresh, so wholesome, so original. —*The Spectator.*

The Life and Letters of Edgar Allan Poe

By JAMES A. HARRISON, Professor in the University of Virginia.

This publication is an event of more than usual importance, since it is the first which presents, together, an accurate Biography and a collection of Letters of one of America's greatest and most interesting literary figures. The Letters give many new glimpses of Poe and his friends—among them Irving, Willis, Simms, Longfellow, Hawthorne, and Lowell.

In two volumes, with 45 illustrations, 12mo, gilt top, cloth $2.50 net; half calf, $5.00 net. Postage 25 cents.

Love's Labour's Lost

"First Folio Edition."

Edited with Notes, Introduction, Glossary, Criticism, and Variorum Readings by Charlotte Porter and Helen A. Clarke.

An accurate reprinting of the famous First Folio Shakespeare of 1623, in the original spelling and punctuation. Succeeding editorial changes are given in the Variorum Readings. This is the only First Folio text available in handy volume form.

"One of the best I have seen. Should be welcome to teachers and careful students."—William J. Rolfe.

"Will hold a place by itself among all reprints."—The Outlook.

Can you converse

Intelligently regarding any book you may have been reading—as if you had really *sized it up* completely? Well, a novel, a poem, a history, a biography, a drama, an oration, a sermon, or any other literary production, if read or studied as *our new book* tells one how, becomes a subject which one can discuss or write about in a thoroughly intelligent and comprehensive way.

PUBLISHERS OF THE LIBRARY.

Two Invaluable Books for Students of Literature

Edited by SHERWIN CODY

A SELECTION OF

The World's Greatest Short Stories

The best available compilation of these short masterpieces of fiction, which, with Mr. Cody's admirable and pertinent introductions and notes, constitutes a history of the art of short-story writing. It has now been adopted by over thirty educational institutions. The examples have been taken from Boccacio, "Arabian Nights," Irving, Balzac, Dickens, Thackeray, Poe, Hawthorne, Maupassant, Kipling, Barrie, and Arthur Morrison.

READY MAY 9.

A SELECTION OF

The Best English Essays

It is hoped that Mr. Cody's new book will meet with the same approval from educators as did its predecessor, *The World's Greatest Short Stories.* It will be found equally useful on account of Mr. Cody's general introduction, and his historical and critical introduction to each essay. These, together with the selections, illustrate perfectly the history of English prose style. The ten writers whose essays are used are Addison, Bacon, Carlyle, DeQuincey, Emerson, Arnold, Lamb, Swift, Macauley, and Ruskin.

Each of these volumes is printed on thin Bible paper, making a very convenient book. Flexible cloth, 18mo, $1.00 net each.

A. C. McCLURG & CO., Publishers, CHICAGO

Wisdom and Will in Education

By CHARLES W. SUPER, Ph.D., LL.D.,
Ex-President of the Ohio University.

This book is not intended exclusively or even chiefly for teachers, but for all persons interested in education in its larger aspects. Price $1.25.

READY APRIL 25TH

Robert Neilson Stephens's New Book

THE MYSTERY OF MURRAY DAVENPORT

$1.50

In his new novel the author of "Philip Winwood, an Enemy to the King," etc., has made a radical departure from the themes of his previous successes. Turning from past days and distant scenes he has taken up American life of to-day as his new field, therein proving himself equally capable. Original in its conception, striking in its psychologic interest and with a most perplexing love problem, "The Mystery of Murray Davenport" is the most vital and absorbing of all of Mr. Stephens's novels, and will add not a little to his reputation.

A Story of Ward Politics

The Spoilsmen

By ELLIOTT FLOWER

Author of "Policeman Flynn," etc.

$1.50

"Elliott Flower's 'The Spoilsmen,' introduces a character whose speech is the speech of Policeman Flynn, although he bears another name; a young aristocrat who sets himself to fight 'the machine,' and that most pathetic of all political figures, an honest poor man who goes into politics from pure public spirit and is remorselessly ruined by the thieves whose accomplice he will not become."—*N. Y. Times Saturday Review.*

"The best one may hear of 'The Spoilsmen' will be none to good. As a wide-awake, snappy, brilliant political story it has few equals. One should not miss a word of a book like this at a time like this, and in a world of politics like this."—*Boston Transcript.*

A Stage Story

A Daughter of Thespis

By JOHN D. BARRY

Author of "Mlle. Blanche," "The Intriguers," etc.

$1.50

The author's experiences as a dramatic critic have enabled him to write with authority on the ever fascinating theme of stage life. From "the front," in the wings, and on the boards—from all these varying points of view is told this latest story of the player folk—an absorbing tale.

A Satire

Prince Hagen

By UPTON SINCLAIR

Author of "King Midas," etc.

$1.50

The scheme of this work is as delightful as it is original. Prince Hagen, son of that Hagen who killed Siegfried, comes to this earth from Nibelheim for a completion of his education, and it is the effect of our modern morality upon a brilliant and unscrupulous mind that forms the basis of Mr. Sinclair's story.

As a story simply, the book is thoroughly entertaining, with a climax of surprising power, but as a satire it will live.

A Phantasy for the Fanciful

The Silent Maid

By FREDERICK W. PANGBORN

$1.00

A dainty and delicate legend of the brave days of old, of sprites and pixies, of trolls and gnomes, of ruthless barons and noble knights. The "Silent Maid" herself, with her strange bewitchment and wondrous song, is equalled only by Undine in charm and mystery. The tale is told in that quaint diction which chronicles "The Forest Lovers," and in which Mr. Pangborn is no less an artist than Mr. Hewlett.

For sale by all booksellers or sent prepaid on receipt of the price by the publishers

L. C. PAGE & COMPANY, New England Building, BOSTON

LONGMANS, GREEN, & CO.'S NEW BOOKS

LIMITED EDITION

The Works of John Ruskin

Edited by E. T. COOK and ALEXANDER WEDDERBURN

Complete and Authorized LIBRARY EDITION

Messrs. Longmans, Green, & Co. have made an arrangement with Mr. George Allen to issue this edition of Ruskin's Works in America, and the first volume is now ready. The LIBRARY EDITION will be complete, including all of Ruskin's books hitherto published and a considerable amount of new material. Each volume is prefaced by an introduction which is at once bibliographical and biographical. In the compilation of these prefaces Ruskin's Diaries, Letters and Conversations have been largely used.

The Edition is also complete as including all the *Illustrations* already published as well as a considerable number of drawings which have not hitherto appeared.

The Volumes are printed in large type on a special quality of "Unbleached Arnold" paper, with a watermark of Mr. Ruskin's seal and monogram; the binding is in cloth, uncut edges; the Edition for sale in the United Kingdom and America is strictly limited to 2,000 copies, and the type of each volume is distributed as published. It is expected that the work will be complete in 32 volumes, and orders can be accepted for complete sets only. The price of each volume is $7.00 net.

A prospectus fully describing the edition, with specimen page, etc., will be mailed on application to 93 Fifth Avenue, N. Y.

AMERICAN TEACHERS SERIES (New Volume)

The Teaching of English

By Professors GEORGE R. CARPENTER, FRANKLIN T. BAKER, of Columbia University; and FRED. NEWTON SCOTT, of the University of Michigan. Crown 8vo. 390 pages. $1.50.

"The earnest discussion of the teaching of English within the last quarter-century has made it necessary to have a succinct statement of the issues in question and a careful summary of the most sound opinions regarding them. Such a statement and such a summary we have tried to present, for the information and guidance of the novice, and as a convenient book of reference for the experienced instructor. We have endeavored to avoid eccentric, dogmatic, and personal opinions, and to present the subject in as many of its important aspects as possible, helping the reader to see the reasonable differences of method and theory, and urging him to weigh the arguments on both sides of all doubtful questions."—*Preface.*

CONTENTS—I. HISTORY AND METHOD. Chap. I. The Study of the Mother-Tongue. I. Latin and the Vernaculars. II. The Teaching of the Vernaculars in Europe. III. LONGMANS, GREEN, & CO., 93 Fifth Avenue, New York

The Nation.

NEW YORK, THURSDAY, APRIL 16, 1903.

The Week.

The average reader of President Roosevelt's Fargo speech would get the impression that every officer guilty of cruelty to Filipinos had been punished. But the President himself has disapproved the verdicts in the cases of Brig.-Gen. J. H. Smith, Major E. F. Glenn, Capt. J. A. Ryan, First Lieut. E. A. Hickman, First Lieut. J. E. Gaujot, First Lieut F. T. Arnold, and others who were tried for cruelty to prisoners or natives, on the ground that justice was not subserved by the trial courts. First Lieut. E. Hagadorn, who tortured natives by depriving them of water, was never punished until he was landed in the penitentiary for vulgar embezzlement. First Lieut. George DeG. Catlin was never tried for offences against natives, on the ground that he was unbalanced; but he is now on duty again. Capt. Howze has thus far escaped punishment for his offences at Laoag. Gen. Chaffee officially disapproved the acquittals of Major Waller and Lieut. Day, the marine officers, tried for cruelty in Samar, and Gen. Davis has just disapproved the findings in the second trial of Major Glenn. We believe we are correct, therefore, in saying that in every case except that of Capt. Preston Brown, found guilty of murder, the findings of the court have been practically set aside by the highest reviewing officer—a sufficient commentary on the efficiency of the present court-martial system. But President Roosevelt has stepped in where the courts have failed, and, as we have frequently pointed out, upheld the honor and ideals of the service in a courageous and manly fashion (except in the Brown case), declining to be led astray by tales of Filipino barbarities. That any offenders were punished at all is, we believe, due to him alone.

A cablegram from Manila brings the news that Gen. Davis has rebuked still another court-martial for failure properly to punish an officer charged with manslaughter in killing two prisoners of war. Lieut. Joel R. Lee, Tenth Infantry, is the officer accused. The offence was committed in a small town near Misamis in Mindanao. Lieut. Lee took the two prisoners into his quarters for examination as to their alleged connection with a Filipino leader named Rufino Deloso. After questioning the first man, Lieut. Lee turned him over to a corporal with orders to confine him in Lieut. Lee's kitchen, and to shoot him if he "tried to escape." This man was shot within five minutes, and the second met precisely the same fate, having also "tried to escape" from the corporal, although aware of his companion's fate, and himself unarmed. In this case, like that of Major Howze, the charges were preferred by officers, those of the constabulary having reported Lieut. Lee to his superiors. An attempt was made to turn him over to a civil court, where he should have been tried. Instead, he went before a court of his fellows and was acquitted—illegally and in flagrant contradiction of the testimony, according to Major-Gen. Davis, who holds Lee unworthy of acquittal.

The eagerly expected list of army officers selected for duty on the new general staff, as announced on Thursday, will, as a whole, give great satisfaction to the army. Every man chosen is a graduate of West Point, twenty-two classes being represented, from that of 1867 to that of 1897. Thirty of the officers have been graduated since January 1, 1879, and represent the younger and progressive element in the service. Of the other twelve, three saw service in the civil war before entering West Point, and nearly all have been eminent in one way or another—Lieut.-Col. Charles Shaler in the Ordnance, Major Knight as head of the Torpedo School, Major Duvall as a most excellent regimental commander in the Philippines, Col. J. B. Kerr as military attaché in Brussels and Berlin, etc., etc. The excellent character of the selections is best seen in the list of captains. Not one of these belongs to the class of political officers or notoriety seekers, of which there are still too many in the service. Capt. P. C. March, for instance, showed admirable traits as commander of the Astor Battery and lieutenant-colonel of a volunteer regiment in the Philippines; Capt. J. T. Dickman earned an enviable reputation in Panay, as lieutenant-colonel of the Twenty-sixth Volunteers; Capts. Ramsey and Gallagher were respectively the best quartermaster and commissary developed by the China expedition and by service in the field in Cuba and the Philippines. Capt. J. J. Pershing is the humane cavalry officer who is trying to maintain peace with the Moros without further loss of life, and Capt. C. D. Rhodes, an excellent duty officer, has won by his pen the gold medal of the Military Service Institution. These selections (together with the names passed over) will convince the army that the board which made them lived up to its promise to consider merit only. It is undoubtedly the flower of the service which will enter upon its important duties on August 15, and it is noticeable that no charge of cruelty or misconduct in the Philippines has been made against any army officer on the list. There will, however, be some criticism of the fact that seven officers, or one-sixth, came from Corbin's department—the Adjutant-General's.

The full review of the first eleven months of President Palma's rule in Cuba published in Monday's *Sun*, confirms all reports received from independent sources in regard to the progress of the island. So far from coming to the end of their independent career at the end of six months, as was expected by most of the American officers in Cuba, the people, to quote a recent traveller, "seem to have developed a real genius for self-government." President Palma himself has won praise from many sources by his tact and dignified bearing, and finds himself supported in Congress by a safe majority. There has been no disturbance of law and order except one strike, promptly settled, and the country is so evidently peaceable that the Washington Administration properly contemplates reducing the American troops in the island by one-half, and sending the remainder to the new naval stations. In this connection it is interesting to note that the *Sun's* correspondent believes any armed revolution or warlike insurrection to be "quite as improbable as it is in any State in the American Union." The finances of the island have steadily improved under President Palma. Starting with an alleged balance of $540,000 left by Gen. Wood, the republic had in bank on April 1, 1903, $2,638,000—a striking contrast to the years of Gen. Wood's régime, in which he overspent his income by some $1,400,000.

The *Sun's* observer also points out that the recurrent low price of sugar again threatens the industrial safety of the republic. For a time last fall, conditions were so favorable that the leading planters saw a small margin of profit before them, and began operations with that expectation. Now the market is glutted, and only a few of the estates will make a profit. Some may even be ruined. Fortunately, the imports into the island have shown no decrease whatever, and this has permitted the republic to keep up its sanitary work, to increase its Rural Guard, and to continue to employ the large number of teachers left by the Americans. Indeed, in his last message to Congress, President Palma was able to make a most excellent report upon the progress of the schools, including needed consolidations and the cutting down of the alleged enrolment to real figures of average attendance. Even the *Sun's* correspondent sees clearly that the weak point of the last few years has

been the failure of this republic to foster the industries of the island. He is able to speak enthusiastically about the Cuban people's "patience under adversity, their pluck, their industry, their charity toward each other, and their mutual helpfulness." To them, and not to the United States, belongs the credit of averting predicted disaster. "The special pity of it all is," this writer continues, "that the past year has cost the United States a distinct loss of Cuban confidence and respect." It is gratifying to note that talk of annexation is now being indulged in only by the rich plantation owners. Their motive is too plainly that of personal gain.

The municipal election in Chicago was nearly a drawn battle, for although Mayor Harrison is reëlected, his previous majority of 28,000 has been much cut down. The Republicans put their best foot forward when they nominated Mr. Graeme Stewart. Mayor Harrison is quoted as saying after the returns were in, that he regarded the election as a victory for municipal ownership and for the referendum, rather than as a personal triumph for himself. It may be so, and yet Mr. Stewart might have made a similar claim if he had been the successful candidate. The platform on which he was nominated called for legislation which would enable the city "to own and operate street railways and other public utilities," the question of exercising the power to be submitted to the people. The Democratic platform did not differ materially from this. Thus we may assume that Chicago is committed to municipal ownership of public utilities, so far as voting can commit a city. It is perhaps fortunate that the municipality is short of money, and is so hampered by a debt limit that an amendment of the State Constitution will be required to carry the plan into effect. In St. Louis the election resulted in a signal triumph of the Democratic machine which has so long held the city captive, and against which Circuit Attorney Folk has made so splendid a fight in the courts of justice. None of the convicts nominated by Mr. Folk for the State Prison, however, were put up by their party for any other office at this election. Yet, though both parties named good men for the Council, the House of Delegates is stuffed again with representatives of the boodlers. Every candidate endorsed by Mr. Folk was defeated. A very poor showing this as a preliminary to the opening of the Louisiana Purchase Exposition.

A primary election under the new direct-nominations law has resulted in the selection of an anti-machine man as the Republican candidate for Mayor of Baltimore. He had no organization behind him, merely announcing his candidacy and making a personal canvass for the nomination. On the Democratic side, the candidate of Boss Rasin secured the Mayoralty nomination, but in at least one Council district the choice of the primary was a man who made his canvass in the face of machine opposition. These are the results which the advocates of the direct primary have ardently hoped for and confidently predicted. They are certainly more favorable than those recorded in Minnesota, where the notorious "Doc" Ames was a successful candidate for Mayor of Minneapolis at the time of the first experiment. Further details of the Baltimore primary will be awaited with great interest. New Jersey is also to furnish an opportunity for renewed observation of the system. A law enacted by the Legislature which lately adjourned, provides for the nomination of candidates within small political divisions by the direct primary system, and also for choosing in a similar manner delegates who in convention will nominate candidates for the more important offices. This is a variation of the Minneapolis system, but the essential features are retained.

A new libel law, protested against by almost every newspaper in Pennsylvania, has just been passed by the Legislature of that State, and is now before the Governor. The aim of the measure is to protect the pure patriots attached to the dominant party in Pennsylvania from criticism or ridicule, by cartoon or otherwise, in the public press. It prescribes punitive damages to heal the wounds of statesmen whose lapses of conduct are made the subject of the satire of the newspaper artist, and, in the words of a Philadelphia newspaper, strikes a blow at a free press by "opening the door for speculative shysters and unprincipled curbstone followers who may set up factitious complaints." The Republican Philadelphia *Press* calls loudly upon the Governor to veto the bill. Of course he may do so, but he has already shown himself in sympathy with something of the sort. In his first annual message he alluded feelingly to the injustice of criticism of men in high station. Indeed, the descriptions of this bill sound to us very much like echoes of his initial state paper. Opposition to the bill seems especially ungracious to Quay, the reformer. When he took his new vows he had a right to expect better treatment from the newspapers. If they do not accord it to him, what wonder that his Legislature seeks to compel them?

Three business agents of labor unions in this city are under indictment for corrupt practices; in two other cases District Attorney Jerome has proved to his own satisfaction that money has been paid to labor leaders to have grievances "called off"; and in another the District Attorney has produced conclusive evidence of the guilt of a union official. These are the facts upon which a committee of the Central Federated Union bases its report that charges of irregularities on the part of labor leaders have utterly failed of substantiation. It is true that in the three instances last mentioned the District Attorney does not hope to secure convictions in the courts, owing to the timidity of witnesses or the lack of complete legal evidence. But it would seem to us that the information furnished by Mr. Jerome was enough to urge the labor committee very definitely upon inquiry. It is not likely that they really desire to uphold corrupt representatives merely because thus far they have been able to evade the sheriff. Yet this would be a natural inference from the report submitted on Sunday. The Central Federated Union should realize, if its committee does not, that mere whitewashing of walking delegates and other leaders will not do.

Union against union is the formula that explains the strike of some 9,000 carpenters and joiners in this city. The United Brotherhood of Carpenters and Joiners, a powerful national body, aims to put the Amalgamated Society of Carpenters and Joiners, a local organization with 2,000 members, out of business. The Brotherhood has absolutely no grievance against any employer on the ground of wages and hours of labor. It strikes because it will allow no "Brother" to work on any job with which a member of the Amalgamated Society is associated. This phenomenon of rival unions is most interesting. It seems to show, first, that the union business is too profitable to permit of monopoly; second, that labor does not as yet trust any union sufficiently to make it sole agent for any trade. The unions can afford to fight it out comfortably and to a finish if, like the Plasterers' their constitutions provide that in case of a dispute with an employer he must pay all the unionists for their "waiting time." Both these Carpenters' unions belong to the American Federation of Labor.

Combinations adjudged to be in restraint of trade are not confined to corporation mergers, as the master plumbers of St. Louis have just discovered. The Association of Master Plumbers was organized, as the local court, under instructions from the Court of Appeals, has decided, in violation of the anti-Trust law. The specific offences were attempts to fix prices, and to restrict the sale of plumbers' supplies to master plumbers only. The suit was brought by a workman who was unable to secure materials, and the decree of the court is that the association must be dissolved. Thus we learn that what is sauce for the goose is sauce for the gander. As

there are hundreds of similar associations throughout the country, the influence of the decision, which appears to be based on excellent reasoning, is likely to be far-reaching.

Mr. Henry James, as an admitted expert on the expatriated American, should be called in to settle a case that is troubling our consular service. The question in brief is, When is an American citizen no longer an American citizen? The Consul at Quito finds that business men who speak not a word of English, have lived for forty years or more in South America, and meanwhile have maintained no relations of any sort with the United States, flaunt their American citizenship, and in time of disorder claim the protection of the American flag. Consuls, habituated to all manner of absurd and illegitimate appeals, hardly know what to do in such cases. They cannot afford to treat an American citizen like an impostor, and they naturally do not wish to treat an impostor like an American citizen. In a lesser degree the same condition of things prevails at every large consulate in Europe. The Consul and the generally needy and frequently doubtful American are seldom long parted. No remedy immediately suggests itself, though patience and a sense of humor will alleviate such consular troubles. Possibly as our population becomes less homogeneous and such dangerous elements as the foreign criminal societies are added to the ranks of mere swindlerdom, we shall have to forego some of our happy-go-lucky republican ways and adopt such European fixings as the card of identification, and some form of registration for travellers. The present passport does not help our consuls much. It is too easily obtained by any applicant.

The International Agricultural Congress at Rome turns out to be, in part at least, a high-tariff convention to protect the wheat growers of Continental Europe against American grain and meats. At all events, that is the significance of it, in the view of the leading German representative, Count von Schwerin-Loewitz, who said in an interview on Monday that he contemplated a common understanding between European countries to safeguard their agricultural interests by means of protective tariffs. These tariffs, he thought, should be based on differences in the natural conditions of production. By this he meant that if the cost of producing wheat in America was two-thirds of the cost in Germany, then the German producer should be protected by a duty of 33 per cent., and that the percentage should be computed for each country and the tariff fixed in each accordingly. This would not imply a European Zollverein, yet it would be necessary for each country to act on the principle of the Zollverein, since otherwise American wheat might be introduced into Holland or Italy at low rates, or free of duty, and consumed there, and a corresponding amount of Dutch or Italian wheat be shipped to Germany, to the discomfiture of the Agrarians of the latter country. We remark in passing that this theory of cost of production is the same that was announced by President Roosevelt in his speech at Chicago the other day, except that the latter referred more particularly to manufacturing industry. Mr. Roosevelt said that the difference in cost of production was the true measure of the Republican tariff system, and he assimilated this to the cost of labor, but he did not say how this difference should be computed and reduced to figures.

Chancellor von Bülow's recent boast that Germany is of all European Powers the most eligible for alliances, seems to find ironical confirmation in the report that with Germany, France and England are to control the Bagdad Railway. In this settlement of a long disputed question, one can only see a desire on the part of France and England to limit the ascendency of Germany in Asia Minor. France has little but a sentimental interest in this enterprise as traditional protector of the Holy Land; Germany has the stake of a great and growing trade, as well as a diplomatic position as friend of the Porte; England has prospective commercial gains to consider, and has every interest in a road which strategically touches the Russian lines of advance towards the Persian Gulf. Regarded from any point of view, it is a strange partnership—complicated at the outset by the relations of France and Russia, and subject to all manner of confusion should the Russo-German *entente* into which Bismarck entered regardless of existing treaties, ever be renewed. The tripartite management is no more likely to be stable than the receivership of Egypt under an international commission, and this time it may not be England that will enjoy the honor and emoluments of surviving partner.

The complete collapse of the general strike in Holland is something of a surprise to those who have watched it gathering through many weeks. It appears now that the General Committee of the laborers' unions merely took a desperate chance in the hope of heading off Premier Kuyper's anti-unionist bills. The firm attitude of Parliament in enacting these laws in the face of a general strike has apparently taken the heart out of the labor leaders, who have had the grace to withdraw an empty proclamation. Alarmist reports had evidently credited them with greater power than they enjoy. This is clearly shown by the refusal of many classes of workmen to obey the strike order. Through the imperturbable courage and good sense of the Dutch Parliament and of the Dutch laborer, a very perilous situation has been handled with astonishing promptness and success.

It did not need the death of the Russian Consul at Mitrovitza to make the Macedonian situation critical. It was already so, though the demand of Russia that her slain official be avenged will freshly embarrass the Sultan, and exacerbate a state of affairs which is obviously causing the European Foreign Offices a great deal of anxiety. Mr. Balfour's tone, when last referring to the matter in the House of Commons, was exceedingly grave. Letters from missionaries of the American Board in the troubled region were printed on Saturday, and show how acute the situation is. What is immediately most depressing is the poor success of the programme of reforms, as urged by Russia and Austria and ostensibly accepted by the Porte. On one side is a settled doubt of the Sultan's sincerity; a reforming Sultan is almost a contradiction in terms. This is felt with peculiar conviction by the Albanians and Macedonians, who have had so long an experience of the tender mercies of Turkish rule, and it is their very incredulity and resolution to be quit of the Turk at any cost which, on their side, make the wheels of Austro-Russian reform drive so heavily. The chronic insurrection may be blanketed, for the time being, by some such plan; but that the flames can be permanently extinguished in that way, is least believed by those who know most of the unhappy countries torn by the agitation.

For a really business-like Constitution, commend us to the Servian. A ruler suddenly finds that bad laws have been passed. Under any ordinary form of government he would have to await the slow processes of the courts in a Constitutional case, or work for repeal. All this means time and trouble, and the results at best are uncertain. Where should we be to-day if the Supreme Court had given one more voice against the insular bills? They do things better in Servia. King Alexander finds that Parliament has passed too liberal suffrage laws. Where a mere President must grin and bear it, the Servian monarch abrogates the Constitution for about five minutes, turns out all the offending councillors and lawmakers, and provides for new, denounces the distasteful laws by proclamation, and then proclaims the Constitution once more. All this has an unmistakable—a fairly Balkanic—directness, beside which our habit of passing unconstitutional laws, in the hope that the Supreme Court will decide for the *status quo*, seems cheap and shuffling.

THE MERGER CASE.

Divested of all technicalities, the question presented to the United States Circuit Court in the so-called merger case was whether the union of the Northern Pacific, the Great Northern, and the Chicago, Burlington and Quincy Railroads, by whatever means accomplished, was in conflict with the anti-Trust law passed by Congress in 1890. If it was so, then the combination was null and void, and was liable to be resolved into its original elements, while the persons engaged in it as promoters and participants were punishable at the discretion of the court by fine and imprisonment. The Circuit Court has decided that the combination was of this very kind. An appeal will be taken to the Supreme Court, but there is small probability that the judgment will be reversed. The Circuit Court rests its decision in this case mainly on decisions of the superior tribunal in previous cases which are considered substantially parallel.

The anti-Trust act was reported by the Finance Committee of the Senate on March 21, 1890, on which day Senator Sherman, the Chairman of the Committee, made a speech explanatory of its provisions. He asserted that the aim of the measure was to declare unlawful the trade combinations usually called Trusts, and to prevent them from monopolizing various articles of common necessity, or from putting prices up and down at their own pleasure, to the detriment of the community. It has been assumed by certain persons since the decision was rendered in the Northern Securities case, that the anti-Trust act of 1890 was not intended by Congress to be applied to railways at all, but only to industrial Trusts. The intentions of Congress in passing laws are to be learned from the laws themselves, though in cases where the interpretation of a statute is open to doubt the debates may sometimes prove useful by throwing light upon dark places. Since no exception was made of railways in the terms of the act, they are necessarily included in its prohibitions and penalties; but, as a matter of fact, Senator Sherman, in his opening speech on the bill at the date mentioned, referred to monopolies of transportation as though they were embraced in it. Thus he said: "If the combination affects interstate transportation, or is aided in any way by a transportation company, it falls clearly within the power of Congress, and the remedy should be aimed at the corporations embraced in it, and should be swift and sure." Another point, much discussed both in the arguments of counsel and in the opinion of the court, was anticipated by Senator Sherman in his introductory speech—the point relating to the intentions of the parties to the merger. The Senator said that the intention of those who form such combinations is immaterial. The intention of a corporation cannot be proved. "It is the tendency of a corporation and not the intention that the courts can deal with."

There is one element in the case, over and above its narrow legal features, which points strongly to the affirmance of the opinion just rendered. It relates to the practical results of the merger as a part of railway development, if it goes on unchecked. If a holding company can bind together the three railroads named, is there any limit to such combinations? It is well known that while this combine was in the process of formation, the Union Pacific people were reaching out for the Northern Pacific, and very nearly acquired it. They came so near getting it that the opposing party thought it best to make concessions to them instead of pushing them to extremity. In fact, the Union Pacific interest is even now represented on the Board of Directors of the Northern Securities Company.

The moral to be drawn from the situation is that there is no limit to such mergers except the inclination of the parties in control. Another New Jersey company can be formed to take over the stock of the Northern Securities Company, and of the Union Pacific and its belongings, including the Southern Pacific. This might fitly be called the Central Securities Company. It would control all the trunk lines to the Pacific Coast except one. This one could, of course, be obtained on some terms, and then the monopoly would be complete. Nor is there any apparent reason why mergers should stop when they reach the Pacific Coast. It is as easy to merge eastward as westward. Prudence might suggest that merging should stop short of a consolidation of all the railroads in the country, but the question whether it should have any assignable limits would be a question of profits only. Mr. Morgan and Mr. Hill will not hold their hands if they think that Mr. Schiff and Mr. Harriman may get ahead of them. Conversely, Schiff and Harriman will not be good if they suspect evil of their rivals and competitors, in the business of preparing undigested securities for the American and European public. Hence the future to be faced by the courts, by Congress, and by the people is that of a merger of railroads without any assignable limits. Confronted by such possibilities, we need not wonder that the court sitting at St. Louis rendered the decision now before us.

Not only did these menacing facts and prospects tell strongly against the Northern Securities Company, but the presentation of the law by Attorney-General Knox and his assistant, Mr. Beck, was extremely cogent. Their argument was so arranged as not to strike at other interests, where it was possible to avoid them. The Government's case was not handicapped by unnecessary weight, and yet it omitted nothing essential to success on the main point of dissolving the illegal combination. The law officers of the Government are to be congratulated on a notable victory gained against very able men, backed by a combination of railway capital in excess of one billion dollars—the largest, perhaps, that the world has ever seen. To President Roosevelt this is much the greatest success, not merely accidental, that he has ever gained. It was an accident that made him President, but it was no accident that he directed the powers of the Government into the channel which it took in this judicial proceeding. The United States could alone take the initiative in challenging the legal status of the Northern Securities Company, and it lay in his power to set the machinery in motion to that end, or to withhold it. It is a matter of doubt whether the political bosses who favored Mr. Roosevelt's nomination as Vice-President in order to get rid of him as Governor of New York would do their job the same way again.

There is no reason to suppose that the owners of shares in the Northern Securities Company will lose any money by the dissolution of the company. The underlying securities which they will receive in exchange are of exactly the same value as their present holding. The income derivable from the one class is the same as from the other. Therefore, any apprehensions of financial disturbance from that quarter may be set at rest. A more important question is how far the present decision, if affirmed by the Supreme Court, may be applicable to other mergers. Upon this point it is impossible for anybody to speak with authority, since circumstances are likely to vary more or less in each case.

In the *Political Science Quarterly* of December last Mr. H. T. Newcomb published a long catalogue of railway mergers, which derives fresh interest from the decision in the Northern Securities case. The control of the Central Railroad of New Jersey, for example, was acquired by the Reading Company (not the Reading Railway Company) in 1901 by the purchase of a majority of the shares of the former. The purchase was paid for in cash, which was obtained by issuing collateral trust bonds secured by the purchased shares and by a small amount of other property. The Reading Company controls the Philadelphia and Reading Railway Company through the ownership of its stock. In 1898, the New York Central Railroad Company obtained substantially all the stock of the Lake Shore Railroad Company by exchanging therefor its collateral trust bonds. These were not, however, parallel and competing roads. The New York Central had previously acquired the Harlem and the West Shore Roads, both of which were competing lines, but operating in only one State. In 1885, the Lake Shore Railroad acquired the New York, Chicago

and St. Louis (the Nickel Plate), a parallel and competing line, operating in three States. The New York, New Haven and Hartford Railroad in 1898 acquired the New England, a parallel and competing line in three States. The Louisville and Nashville has lately been absorbed by the Atlantic Coast Line. The means by which mergers are accomplished are various: by the purchase of the shares of one company by another; by the leasing of one company by another; and by the creation of a "holding company" to purchase the shares of two or more companies and to lease others. It would seem as though all of these methods of merger were alike obnoxious to the anti-Trust law of Congress, if the roads were parallel and competing and were engaged in interstate commerce.

NO PHILIPPINE "FLINCHING."

President Roosevelt's latest speech on Philippine policy shows that, in the main, he is in accord with the majority of Americans. They feel, as he does, that the subject is a most disagreeable and painful one. Like him, they cast about to find excuses for having violated in the Philippines all their professed principles of humanity and liberty. Only, as he is a rather more ingenuous man than the average of his countrymen, and does his thinking aloud a little more impetuously, he is in danger of pushing the argument further than it can fairly be made to go. He did this in his Fargo speech April 7. Advancing beyond any of his predecessors in apology, and even beyond his own previous utterances, he maintained, not simply that our course in the Philippines was necessary, though unpleasant, not merely that it was really good for the Filipinos, though they might not think so, but that it is exactly what their national leaders really wanted. But this, we submit, is to add insult to injury. It is also to fly in the face of history.

The President cites the language of José Rizal, in 1896, protesting against the rebellion then directed against Spain, and saying that, while he desired "liberty for our country," he desired first a "development of the people." There, said Mr. Roosevelt, you have exactly our "avowed policy" in the Philippines. The martyred Filipino hero was sighing for what "American sovereignty" is doing. The true leaders of the people, the President implies, did not desire Filipino independence. But, to say nothing else of this contention, it is a flagrant case of special pleading. Mr. Roosevelt "claims to be an historian," he has said. As such he knows something about the way popular movements often pass beyond the first intent or avowals of their promoters. Because he could quote from Franklin or from John Adams before the Revolutionary war expressions of loyalty to the English crown, would he argue that the American colonies did not really want independence? Because the Republican party in 1860 disclaimed any intention to interfere with slavery in the Southern States, would he maintain that emancipation was not a legitimate Republican policy? It is nothing short of an affront to the Filipinos to tell them to-day that the noble man whose name was on their lips, and the inspiration of whose example was in their hearts, throughout all their ill-fated struggle for independence, was really against independence! Rizal died, like Nathan Hale, regretting that he had not more lives to give for his "beloved country." He was, at any rate, spared the bitterness of living to be told by his conqueror that the "patria adorada" of his passionate "Last Thoughts" was really a foreign sovereignty!

If President Roosevelt truly wished to produce historical evidence of what the educated Filipinos really desired in 1898, why did he not take the testimony of our own naval officers? Paymaster Wilcox and Naval Cadet Sargent travelled extensively through Luzon late in that year. They bore witness to the good order and efficiency of the Government which the natives had set up; said that nearly all the officials were "men of intelligent appearance and conversation"; and added that there was but one sentiment among "the large number of officers, civil and military, and of leading townspeople we have met." "They all declare they will accept nothing short of independence." But historian Roosevelt sweeps all this aside in favor of a detached saying of one man, two years before. He also sweeps aside the fact that the people did develop sufficiently after Rizal's death to set up an independent government at Malolos, which commanded the admiration of Americans who observed its ability and dignity. That nascent republic the Great Republic destroyed. The beginnings of national life in the Philippines we drowned in blood. If Spain had done it, if any monarchy had done it, America would have flamed with indignation, and Theodore Roosevelt would have been foremost in denouncing it as a crime against liberty. But because we were the ones who did it, we have to justify ourselves; and the latest hypocritical way of attempting that is to maintain that we were only doing what the seers and martyrs of Filipino liberty hoped and prayed and bled to accomplish.

All this, the President tells us, was but our "duty" in the Philippines, and from that duty, he adds, "the American people will never flinch." Well, we hope they will never flinch from telling the truth; and what is the truth about the attitude of the great mass of Americans towards the Philippines to-day? Most of them take no interest in the subject whatever. They dismiss it as something of which they are thoroughly tired, and of which they wish to hear no more. Indifference and neglect are already the lot of the unfortunate islanders, so far as concerns the general sentiment in the United States. And this gives the exploiter and the place-hunter just the opportunity from which they are not in the least "flinching." They are swarming to the archipelago in the spirit which Gen. Chaffee displayed with soldierly bluntness, when he said that he didn't know or care whether the Filipinos hated us, but was sure that the thing for us to do was to wring the last dollar out of them. As for the office-beggars, they are already, as the President knows, taking the position that it is an outrage to give even minor appointments to the Filipino, who, they frankly maintain, is in his own country "nothing but a d—d foreigner."

We, too, believe in a policy of "no flinching" about the Philippines, but the thing we would not flinch from is the hard fact. Let us clear our minds of hypocrisy. Let us say that we are strong enough to do what we like; that we are staying in the Philippines to exploit them; that we do not care a copper what the natives think or wish; and that if anybody interferes with us we will give him a good thrashing. That will be both frank and truthful. So let us march up to it without flinching. We ought to have dregs enough of conscience left, however, to flinch badly when it comes to putting such a Tartuffian gloss upon our conduct as the President attempted at Fargo.

THE POSTAL SCANDALS.

President Roosevelt and his Postmaster-General have a busy season before them if they attempt to calm down, between now and the meeting of Congress in November, the upheaval which has resulted from a quarrel among the lesser dignitaries of the Post-office Department at Washington. The situation there has not been so strained since the days when the notorious commission firm of Brady, Dorsey & Co. conducted under the Department roof their thrifty traffic in Star Route contracts. Then, as now, every responsible man in one branch of the postal service became suddenly afraid of his neighbor, and passed him with a chilly nod rather than be seen in familiar conversation with him; for nobody could guess whose name would be blazoned in the next day's revelations, and isolation and ignorance seemed to be the only isles of refuge. Then, as now, nobody could be induced to "talk," but bureau secrets and private backbitings from no discoverable source found their way every few hours into the public prints.

All accounts agree that the present trouble is not of mushroom growth. It is merely the eruptive culmination of a

disorder which has been going on beneath the surface for years. Gossip has long been rife with the good name of the Department, and veiled hints have been thrown out here and there as to the dreadful things that would be disclosed if a serious investigation should ever be set on foot. Clerks who have persistently been refused promotion have assured their friends that they were passed over because they "knew too much," without trying to explain how it happened that they were not expelled from office altogether lest they should add to their stock of fatal knowledge by a longer stay near the fountain-head. Any officer whose salary Congress has raised, has become at once a target for ambush fire from brother officers not likewise favored, since they could see in his good fortune only a sign that he must have connived at fraud with the lawmakers who engineered the increase, and was drawing his extra pay as hush money in instalments. Naturally, such comments, if they reached the ears of their objects, provoked appropriate retorts. Thus, from the top to the bottom of the Department, an antiphony of crimination and recrimination has been maintained, always in whispers, always by innuendo, to the demoralization of the service and the disgust of the listeners outside.

In justice to all concerned, it should be said that nothing thus far brought to light wears quite the vulgarly felonious aspect of the Star Route exposure. But in such matters ordinary citizens do not draw subtle distinctions. To them the fact that a man close to the seat of authority is interested in a corporation with shares of stock to sell, and that men and women whose livelihood may be dependent on his favor are found subscribing for these shares, is almost as disagreeable as a well-defined case of blackmail. If they learn that one manufacturer of postal supplies is patronized because he has "done right by the party," at the expense of other manufacturers who were only trying to do right by the public, the circumstance wears an ugly look. Prove to them that letter-carriers and delivery routes have been ladled out with great liberality to the districts where they will do the most good when the Department next goes in quest of favors from Congress, and they will condemn the practice, in spite of protestations that all dealings between the executive and legislative branches of the Government are conducted on the give-and-take basis. Show them that a post-office building has been rented of A at $100 a year more than B would have charged for equally good quarters, because A could bring a certificate from the party boss in his State that he had subscribed handsomely to the campaign fund, and those undiscriminating moralists, the common people, will not hesitate to denounce it as stealing.

It is such a state of affairs which the investigation now in progress seems to be bringing out. It will convict nobody of a penitentiary offence, but it will be just as damaging in its moral effect as if the whole crew involved could be railroaded to Leavenworth to-morrow. There were vague rumors in the air that the Postmaster-General, who was credited with having entered upon the inquiry reluctantly in the first place, intended to put an effectual damper upon it when he returned to Washington; but he has taken the first opportunity to refute them. However the disturbance may have begun, and regardless of whom it may drag into disagreeable prominence before it has ended, it has gone too far to have an extinguisher applied to it now, even in the interest of administrative harmony and the Republican party's welfare in the next campaign. The time to think of these things was before a Perry Heath was put into virtual command of the patronage of the Department, for the undisguised purpose of having some one at headquarters who knew the secrets of the campaign of 1896, and could tell whose claims to largess should be O.K.'d and whose rejected.

To take one backward step at this stage, no matter what cause might be assigned for it, would be to invite every possible assumption, by the public, of criminality and dishonor. If the Postmaster-General was really more prudent than the President in forecasting the possibilities of the inquiry while it was still under consideration, he can take to himself the poor consolation of saying, "I told you so"; but the work once started must go on to the end. Mr. Payne is too good a politician not to know that the Democrats in the coming session of Congress will be far less complacent in their attitude toward the Administration than they were in the last, when so many were soon to retire from public life and might wish to be remembered when an Opposition berth on some commission was to be filled. By one means or another, they will surely contrive to draw forth enough of the story of this spring's investigation to give a sensational color to their next year's campaign-book; and the Postmaster-General's only chance of meeting such tactics will be to make his own house-cleaning so thorough as to leave nothing for his foes to scrape up after he is done.

HOW TO FIGHT BRIBERY.

That the crime of bribery, electoral and legislative, is on the increase in this country, we have an accumulation of painfully convincing evidence. One deep of shame answereth unto another—Rhode Island to Delaware, Albany to Harrisburg, St. Louis to New York. Men whose right hands are full of bribes sit in the high places of government, go about the streets with heads erect, are in good repute in society and often in the church. Yet they are confessedly making the very pillars of our public life rotten. Popular elections they are turning into merchandise, and rendering the so-called "will of the people," as expressed at the polls, a thing for corruptionists to sneer at even while they manipulate their purchased voters.

To state the case thus strongly is not to confess it hopeless. Bad as our condition is getting to be, it is as purity itself compared with those sinks of iniquity, the English borough elections of a century or a century and a half ago. Read Franklin's account of the unblushing and colossal bribery in the English electoral contests of the time when he was in London as agent of the colony of Pennsylvania, and you would think that public virtue had ceased to exist. For a later testimony turn to that "Call upon the Clergy" to "come forward and assist in putting an end to Bribery, Corruption, Perjury and all sorts of Infamies," which William Cobbett published in his *Political Register* of December, 1816. His description of the case reads like a letter from darkest Rhode Island or deepest sunk Delaware, but is undoubtedly accurate. Cobbett wrote:

> "You know as well as I do that the land is filled with crimes in consequence of the present mode of election. You know that drunkenness, fraud, calumny, bribery, corruption, false swearing, and in short every species of infamy, are produced by this cause, and that, too, in degree and quantity wholly unparalleled in the history of the world. When I was at Honiton, in 1806, many of the wretched voters told me, in the hearing of witnesses now alive, that they knew how wicked it was to do what they did; but that they wanted the money to pay their rents, and that they should be starved if they did otherwise. Some abused me very foully, and said that in advising them to vote uninfluenced by money, I was endeavoring to *rob* them of their *blessing!* For this was the term they gave to the money which they were to receive. But, indeed, the bribery and corruption, the frauds and false swearings are too notorious to need particular instances to establish their existence."

England, we know, has shaken herself clear of that slough. She did it by means of Parliamentary Reform, Corrupt Practices Acts, and, above all, by a quickened public sentiment and a stern enforcement of the law at the hands of incorruptible judges. If we could adopt the English plan of having contested elections passed upon, not by Assembly or House of Representatives, but by a judicial commission without partisan bias, it would undoubtedly be a great check to the bribers. In some other respects, we do not doubt, our laws might be made more stringent. It might be enacted, for example, that political committees should be compelled to file an account of their expenses. Candidates might be required not merely to make public the sums they spend, but also to limit themselves, as in England, to a certain figure, varying with the constituency. Any or all improvements in

the laws against bribery we should welcome, provided they are simple, direct, and attainable. But in any complicated scheme offered as a panacea we cannot put our trust. The weakness of the remedy proposed by Gov. Garvin of Rhode Island, in last week's *Independent*, is that it contemplates an involved readjustment of our whole political machinery. If we wait for Constitutional amendments and proportional representation to rid us of the briber, we shall never get him down. Existing laws, if rigidly executed, would make prison doors yawn for him and all his abettors and beneficiaries.

To enforce the laws we have, rather than to fly to others that we know not of, is the first public duty of those who would set fire to the "tabernacles of bribery." We are glad to hear that such is the aim of those citizens of Rhode Island who are stung by the revelation of their State's shame and alarmed by her peril, and who, with the coöperation of the clergy and the college professors, are about to open a campaign against the corruption which stalks through their commonwealth. Prison stripes on a few of the agents of boss or candidate, punishment and ignominy for some who sit in public places only to take bribes and pervert judgment, would have a wonderfully clarifying and tonic effect. But neither in Rhode Island nor anywhere else must we make the mistake of striking at the tool and forgetting the principal. It is well that the agent of bribery should not go unwhipped, but what is to be done to the man who both provokes the corruption and profits by it?

Here is the opportunity for public opinion to wreak itself in a way more terrible than statutory punishment. Suppose a moral sentiment could be created throughout the land which would look upon every hole-and-corner briber, every petty corruptor, every local perverter of the suffrage, every retail purchaser of legislation, just as all decent men (even President Roosevelt, at last) have come to look upon Addicks. Of what avail would it be to them, then, to buy their way politically if they had to face on every hand the loathing of all who met them? This is the great weapon against the briber which the honest people of the land have in their own hand. Only, they must wield it unsparingly. When they read in the cynical confession of Boss Brayton that it is the protected manufacturers of Rhode Island who furnish the bribe-money, they must condemn and ostracize the men who give corruptly, as well as those who spend or receive corruptly. The United States Senator from Rhode Island, or from New York, or Ohio, who wins his seat as the undoubted beneficiary of wholesale corruption, must be put in the stocks alongside Addicks. They are all of a kind. And with them must be classed the men, no matter how high they stand in the financial or philanthropic or religious world, who put money into the hands of known corruptionists to obtain legislative favors. They are all tarred with bribery, and its heaviest penalties ought to fall on them. Only thus, by laying judgment to the line and righteousness to the plummet, by exposing and opposing every man, high or low, who has the smirch upon him, can we effectively fight and foil the briber.

MEMORIAL TO EDWIN L. GODKIN.

The files of the *Nation* would be incomplete if they did not contain the following letter, which President Eliot communicated to his colleagues of the Corporation of Harvard College on March 30:

NEW YORK, March 18, 1903.

To the President and Fellows of Harvard College:

Some of the friends of the late Edwin L. Godkin have desired to express their admiration and gratitude for his long and disinterested service to the country of his adoption by some suitable memorial, which should perpetuate his name, and stimulate that spirit of independent thought and unselfish devotion to the public good which characterized his life and distinguished his career.

In view of his scholarly tastes and acquirements, the establishment in some learned university of an annual lecture, or lectures, upon subjects to which he had devoted a large portion of his life, seemed peculiarly appropriate.

An appeal for contributions—very limited in extent—brought an immediate and gratifying response from persons of the highest character, indicative of the estimation in which Mr. Godkin and his work were held; and while the list of contributors included many of Mr. Godkin's friends, it included also many others not in general sympathy with his opinions, greatly enhancing the value of their tribute.

In the selection of a university to administer the gift, it was natural that the one should be chosen—itself an advocate of free speech and liberal thought—in which he was so well known and so highly regarded.

The undersigned, on behalf of the contributors, now have the honor of tendering to the President and Fellows of Harvard College the fund collected for this object—now in excess of $10,000. They leave its administration entirely to the discretion of the University, imposing no conditions other than that the income be used in providing for the delivery and publication of lectures upon "The Essentials of Free Government and the Duties of the Citizen," or upon some part of that subject, such lectures to be called "The Godkin Lectures," and of which there shall be at least one in every year.

It is our understanding, however, that no permanent appointment of a lecturer be made, and that the duty be not assigned to persons connected with the University—although such connection shall not be deemed a disqualification—but that the opportunity be employed from time to time to procure from varied and perhaps distant quarters lecturers of the highest distinction.

Enclosed will be found the check of Charles H. Marshall, Esq., the Treasurer of the Committee, for the sum of $10,500, and some subscriptions now unpaid will be hereafter forwarded.

We also forward a list of the contributors to the fund.

We have the honor to be, very respectfully yours,

(Signed) JAMES C. CARTER,
HENRY C. POTTER,
HORACE WHITE,
JOHN L. CADWALADER,
CHARLES H. MARSHALL,
Committee.

Charles Francis Adams, a member of the Committee, is now in Europe; for that reason his name is not attached.

The Corporation "Voted, that the fund to maintain 'The Godkin Lectures' be gratefully accepted on the terms and for the uses set forth in the above letter of gift."

The selection of Harvard College, it might have been pointed out by the Committee, had a specific fitness in view of the honorary degree conferred by that institution in 1871 on the founder of the *Nation*, then just completing its sixth year. It was Mr. Godkin's personal friends at Harvard whose active interest procured the necessary capital for the launching of his enterprise, and this journal has from the first been privileged to draw freely upon the best spirits and intellects of the oldest seat of learning in the country. The fund now bestowed and accepted will pay back the debt in a manner redounding to the just fame of Mr. Godkin and to the usefulness of the University. The prophet has not been without honor among his own kindred; and his works will follow him.

The raising of the fund and its acceptance set a seal upon character of no little import in a time of reaction from Mr. Godkin's ideals and striving. It would be easy to point to men—Harvard men, scholars, prominent in public life—to whom Mr. Godkin's name is anathema; who have never forgiven, and never will forgive, his preaching and illustration of independence of party; who regard his "Mugwumpism" with an abhorrence not to be excited by any symptom of party dry-rot, of that stealthy infiltration of the forms of republican government with the juices of oligarchy and corruption—a process analogous to fossilization, but which is far deadlier than a dull and stupid conservatism. It is something to have such detractors reminded that their Alma Mater became Mr. Godkin's, *honoris causa*, twenty years ago, and now engages to carry on his life-work in perpetuity.

In no country, however governed, will the theme prescribed for the Godkin Lectures ever become supererogatory. In the American republic it is a burning theme. The breakdown of the representative system with the growth of population; the practical abolition of popu-

lar nomination to office; the well-nigh universal failure to regard office first of all as a public trust; the shocking lapse of faith in the principles of the brotherhood of man enunciated in the Declaration; the spread of commercialism and the rise of the rich to the control of the Legislature; the intolerant and violent extension of protectionism through the trade-union—these are some of the phenomena in the presence of which the honest citizen has to ask himself not only, What ought I to do? but, What *can* I do? May the Godkin Lectures bring him help in this perplexity. May they direct the student's attention away from the Soldiers' Field to the sterner discipline of the closet in sober reflection upon current evils and current tendencies. May they also stimulate Harvard's undergraduates to aspire to as glorious a career in public journalism as the Founder's. If every gentleman's sword should have leaped from its scabbard to defend Marie Antoinette, much more should Mr. Godkin's inspiration for a whole generation have drawn to him battalions of young men eager to work beside him. That it did not, that they came not singly even—we mean with a conscious purpose in the choice of a profession while shaping their college education—is a mystery much to be wondered at and *valde deflendum*.

TELEPATHY.

CAMBRIDGE, April 4, 1903.

On the Italian side of the Alps there is a little chapel which is a type of many others scattered on the slope of the mountains. Its bell has for ages called together the peasants for their morning and evening devotions. It has its shrines for votive offerings, and its precious relics before which one can see the devout worshippers with countenances pathetically wrought with religious fervor. Around the picture of a saint are crutches and canes, mute testimonials of the cures wrought by an enduring presence in the minds of the believers. In the Middle Ages the only light before the altar was a dim taper. Now an electric light swings before the shrine, fed from a far distant waterfall, almost in the clouds, nourished from the eternal snows. My friend and I had been reflecting upon the possibility of transmitting energy from such abundant sources over the entire continent of Europe, and, as we rested in a corner of the chapel, my companion pointed to the electric lamp, and remarked that men in the Middle Ages would have regarded the possibility of lighting the chapel from a distant waterfall, by a mysterious influence transmitted over wires, much as the cynic now regards the possibility of telepathic communication with friends in China. "Just as the humble peasant," said my friend, "puts herself in spiritual communication with a higher power, so may we not find a way to telepath to minds that are attuned to ours?"

The thought thus expressed is in the minds of most of our acquaintances; and when we reason with them and apparently convince them of a lack of evidence, the conversation generally ends by their relation of a marvellous tale of telepathic communication which has happened to them, or more often to a friend, and the story is told with a frank disregard of the laws of evidence. The late advances in the subject of wireless telegraphy has led to a greater confidence in the truth of telepathy. One often hears the remark, "Why is the possibility of the communion of one mind with another without the use of electricity more marvellous than wireless telegraphy?"

It must be confessed at the outset that there is at present no evidence of telepathic communication which would be accepted in a court of law in regard to property, or in a scientific laboratory. The evidence which is adduced and submitted to societies of psychical research cannot be compared with that of the simplest analysis of a chemical compound, or that which gave men the suspicion of the electric action excited by the motion of a magnet. I shall return presently to the fallibility of so-called psychic evidence; at present I wish to dwell upon the utter lack of history in the subject of telepathy as a scientific fact. It is one of the chief characteristics of a science that it has a history, and no subject can arise to the dignity of a science unless it has at least the rudiments of a history. Wireless telegraphy has a past, and is the result of the patient study of almost countless facts, gathered by thousands of workers in laboratories. These facts and phenomena can be studied and the phenomena can be repeated by any skilled person. Telepathy has no history, and if it should be ascertained to-morrow that it is possible, it will be the first instance in the history of science of the discovery of a new manifestation of energy or of a new law of nature which had not been preceded by the patient study of repeatable phenomena. It is therefore safe to prophesy that telepathy will not be a fact until it has a history of repeatable phenomena.

It would seem that abundant opportunity has been offered for the accumulation of reasonable evidence of the action of one mind on another during the past hundred years of active intellectual scientific inquiry. Moreover, the hosts of card players, since the beginning of the powers of ratiocination in man, have been in an attitude of interested attention in regard to the action of one mind on another. Telepathic communication would be of great advantage to the gambler, and to the speculator who plays a larger game on the Stock Exchange. However the latter may romance in regard to telepathy at the club, he never relies upon it where dollars and cents are involved.

We must confess that there is no science in the subject of telepathy; it is a belief. When we examine the grounds of this belief, we naturally ask ourselves, How do we communicate with kindred spirits with even the full use of our faculties of seeing and hearing? Do we not judge of a friend's opinion more by the tones of his voice, the lifting of the eyebrows, the gestures of the hands, than even by his words? When he rings us up on the telephone, we gather his meaning by the accumulated memories of the look which habitually accompanies his speech—his smile, whether it be cynical or optimistic. Two deaf, dumb, and blind persons are not conscious of proximity except from the sense of touch. When we express a belief in telepathy, we indulge in a hypothesis of an occult radiation of vibration of a mind cell, far off in China, perhaps, which can affect another mind cell at the antipodes; and we profess a belief that this radiation, like that employed in wireless telegraphy, can set a mind cell in action and communicate the senses of sight, hearing, and the tactile sense. Otherwise, how can we recognize a friend or penetrate his meaning? This is a large hypothesis; it is not in consonance with scientific thought; it belongs to the realm of demonology and witchcraft. Remember, we are not stating our conviction that telepathy is not possible; we are merely saying that if telepathy becomes an acknowledged fact to-morrow, it will be an unprecedented fact in the history of the scientific advance of the human race. There are, doubtless, more things in heaven and earth than are dreamt of in our philosophy; psychic philosophy seems to have taken these words to heart, and is more than ready to substitute intuitions for strenuous scientific investigation. It must be remembered that there are no limits to scientific inquiry, but there are fatal limits to metaphysical speculation.

My friend, while we rested in the little chapel, dwelt upon the dim beginnings of all sciences, the mystical awakenings to the realization of the presence of new phenomena. He dwelt upon Faraday's seeking for the evidence of invisible lines of force seeming to stretch out from wires along which an electric current flows. We now know that such invisible lines emanate from Marconi's masts, and, passing through empty space, hold in their embrace the distant receiving mast. "Is not," said my friend, "the groping of Faraday to discover such lines of force like the groping of the psychical philosophers to discover the evidences of telepathy?" I answered: "There is no scientific resemblance between the methods of inquiry. Faraday consulted the history of preceding phenomena, and used instruments which had been perfected by systematic study, and without which his discoveries would have been impossible. Moreover, he was trained in scientific observation, and understood that when he entered his laboratory he must leave his intuitions with his coat and hat outside, together with his imagination—both, it may be, to be taken up on leaving, but never to be allowed in the strict limits of the workshop."

My friend, more than half a believer in telepathy, remarked: "Have there not been accidental discoveries? Did not Daguerre discover by accident the wonderful art of photography? Is telepathy stranger than the property of silver to hold for years an invisible image of a friend on what seems to the eye an absolutely blank surface; yes, to hold it for centuries in a sarcophagus on the bosom of a mummy, to be revealed by merely pouring a fluid over it?" Did not Röntgen find a mysterious image on such a photographic plate which had been exposed by accident to the mysterious light from an electric discharge?"

"It is true," I replied, "that many phenomena have been discovered by accident; but only those which have been recognized by scientific observers, or, what is much the same, skilful observers, have come to fruition. An untrained man would, doubt-

less, have attributed Daguerre's phenomenon to the spirits. Daguerre's method of following up the accidental discovery is much to my point. Having left a plate of silver exposed in his dark room for some hours, being interrupted by a caller—the blind instrument of fate sometimes called a bore—he returned, and, to his surprise, found an image on the plate. It had evidently been formed by something in the dark room. He proceeded laboriously to try every chemical or substance there was on his shelves, without effect; he then got down on his hands and knees and searched the floor. In a corner he observed some globules of mercury. He had arrived at the end of his research. Mercury was the substance which had quickly brought out the mysterious image. Röntgen also was a skilled observer, and his study of the accident is a model of accurate observation. The accident was followed by the scientific method of patient inquiry. How many accidents have fallen to men who have not seen their import! How many have come to men who have been intellectually asleep! Hawthorne, with his wonderful insight, has, in an allegory, depicted the opportunities that were offered to the sleeping youth, and the allegory fits the intuitional man who has no training to follow up an observation."

My friend was not converted by my reasoning, and I continued in a somewhat intolerant manner, using unguardedly the word Science in speaking of telepathic science. "I use the word 'Science,'" I explained, "for, under the name of 'absent treatment,' it is called science by certain persons. Absent treatment presents in a concrete form the popular belief in the action of one mind on another at a distance. It assumes what is totally unproved, and its believers employ the word 'Science' to give respectability and credence to what has no claim to be called a science. Absent treatment is credulity masquerading in the garb of Science."

Telepathy has no instruments for measurements; it has no reagents; it has no history of past phenomena leading up to a possibility. Its believers carry their intuitions into their study rooms, or what takes the place of laboratories. It is a subject generally in the hands of persons discredited as trained observers. The only methods of inquiry are listening to the stories of hallucinations, and what may be called the postal-card method of collecting information—a method which permits the romancing correspondent full scope, and results in the collection of a large amount of fallacious statistics. What weight should be given to the answers of untrained observers whose antecedents, early education, and environment are unknown to the collector of such statistics? Reflections upon the possibility of telepathic communication leads one in general to scrutinize severely the weight of evidence presented by the believers. Let us, for instance, contrast the evidence for the true value for the specific gravity of lead with the evidence for telepathy. Scores of scientific observers have measured the weight of lead in comparison with that of water, and have compared their results with the strictest impartiality. The faults of the instruments employed in the measurements are given, and complete information is afforded of the means that are taken to arrive at a result which shall not be influenced in the slightest degree by the personality of the observer. There has been no secrecy, no claims for the mystical effect of moods. Compare this method with that of the psychical observer who brings forward telepathic evidence. Suppose this evidence consists of a message between friends separated by seas and continents. In the first place, is the probability of coincidences given due weight? Is the astronomical difference in time between the places calculated? In order to be scientifically accurate, one must be able to measure this time to at least the thousandth of a second, and this measurement cannot be made by the ordinary psychical observers. How much credence can be given to what is called corroborative evidence, such as the description of a witness at the deathbed and the conversation of those present? How much of this is subsequent cerebration; and what care has been taken to prevent the unconscious collusion of the witnesses and the romancing after the event?

Scientific men are sometimes counted among the believers in telepathy. We must remember that laboratory investigation is so strenuous that many men who have made their reputations by accurate work, in advancing years abandon labors which yield at the best small, though precious, returns, for they find it easier to philosophize and to write out their thoughts than to put them to the test of experiment. When a scientific man takes to such work in psychics and philosophy, the death knell of his scientific career is rung.

My friend and I left the little chapel on the Italian side of the Alps; he with still a belief in telepathy, and I with the reputation of being more or less of a materialist. I have grown to regard this term as one more or less complimentary to one's discriminating faculty.

JOHN TROWBRIDGE.

MADAME DE STAËL AND NAPOLEON.—II.

PARIS, March 25, 1903.

On the 8th of May, 1802, the powers of General Bonaparte were prolonged for ten years. "This is the first step towards royalty," said Madame de Staël; "I am afraid that this man is like the gods of Homer: in three steps he will attain Olympus." The plébiscite of August 2, 1802, made Napoleon Consul for life. He was no longer the nominee of the Chambers, he was the nominee of the nation. At the instigation of Madame de Staël, Camille Jordan wrote a pamphlet on 'The True Meaning of the National Vote.' Necker published a book, 'Latest Views of Politics and Finance,' in which he proposed to establish constitutional laws, made a plan for a liberal Constitution, and expressed alarms on the progress of Prætorian ideas. Napoleon, on receiving Necker's book, exclaimed: "Never shall Necker's daughter come back to Paris." She was at the time at Coppet. The prefect of Geneva received orders not to give her a passport for Paris. She was writing her novel 'Delphine.' When it appeared in December, 1802, it had a prodigious success; in her preface, she addressed herself to "silent France." There was still an Opposition, chiefly in the salons; and to read 'Delphine' became a sign of opposition. Napoleon, who had France with him, never had Paris quite on his side. He said: "I hope that the friends of Madame de Staël have advised her not to come to Paris; I should be obliged to have her conducted to the frontier by the gendarmerie." He passed a severe judgment on the novel—"mental disorder, metaphysical sentiment, shocking mixture of love and religiosity, an appeal to insurrection against all social rules." Madame de Staël was a disciple of Rousseau; she held it as an axiom that the rights of society cannot be placed above the rights of the individual. Her heroine is in revolt against all social rules. Napoleon wished to rëestablish order everywhere. Though he did afterwards divorce Josephine, he was an open adversary of divorce, and 'Delphine' was a plea for divorce.

Madame de Staël was a great Anglomaniac, and she denounced Napoleon's projects against England. This, as well as her attacks on the Concordat, incensed Napoleon more and more. At all risks she left Geneva in September, 1803, and established herself, not in Paris, but in a village near it, Maffliers. She wrote to the First Consul, on her arrival, for an authorization to remain, which, it would seem, was not refused. Many people made visits to Maffliers. Benjamin Constant took a house near Madame de Staël's. Madame Récamier established herself at Saint-Brice, close to her. The police reported Madame de Staël as engaged in a political intrigue (Madame Récamier was a friend of Bernadotte and Moreau). An order to depart was sent to Madame de Staël; she stayed a few days at Madame Récamier's, when one evening an officer of gendarmerie arrived while they were at dinner, and showed a letter, signed Bonaparte, ordering him, within twenty-four hours, to conduct Madame de Staël a distance of forty leagues from Paris. All her friends had tried in vain to influence Bonaparte in her favor, among others Joseph, who offered her his house at Mortefontaine. All she could obtain was permission to go to Germany. She would not return to Coppet like "a bird in a storm." She had for some time longed to visit Germany. "I had," she says, "a desire to strengthen myself by the good reception which was promised me in Germany, and to contrast the friendly reception of the old dynasties with the outrage which the First Consul put upon me, and the impertinence of the upstart dynasty which was preparing to subjugate France." It flattered her to become resolutely before Europe the adversary of Bonaparte, and to organize against him a sort of moral coalition. She probably did not herself realize at first the part which she was going to play; but by degrees she became conscious that she represented liberty struggling against despotism.

On the 13th of December, 1803, Madame de Staël made her entrée at Weimar. She intended to stay only a fortnight, but she remained for several months. Weimar contained at the time the most brilliant intellectual circle of Germany, and Madame de Staël had the privilege of seeing familiarly Goethe, Wieland, and Schiller. Weimar gave her the first lineaments of her book on Germany, which was the idealized image of "poor and noble Germany." At Berlin she was welcomed by the beautiful Queen Louise, and became a sort of lion. The news of the execution of the Duke d'Enghien produced an immense impression in all the German courts; no event could

better serve the vengeance of Madame de Staël. Napoleon affected to laugh at the success obtained by Madame de Staël in Berlin. "What does she say of the Court of Prussia?" he asked one of her friends. "That she has recently seen Prince Louis? Is he still amiable? People are always amiable in the eyes of Madame de Staël when they admire her. Is the Queen still handsome, and the marvel of her sex? Undoubtedly the Prussians are much better than the French."

Necker died on the 10th of April, 1804. It was an immense loss to his daughter, who had always had as much admiration as affection for him. The event did not disarm Napoleon, who was proclaimed Emperor and became more autocratic. From her exile, Madame de Staël denounced the Jacobins, the *émigrés*, who formed the new court, the new dignities which were created; she made pleasantries on those "bourgeois et bourgeoises d'Ajaccio" who surrounded themselves with all the pageantry of an old dynasty. In 1805 she left for Italy, after having assured herself that she would not be molested there by French agents. Her first impressions were not favorable. She found nothing to encourage her in her struggle against despotism. The supersitition of the people horrifies her. She finds too many beggars, too many monks. "Can a people ever rise from this?" she writes to Monti; "what a miserable social state!" Art does not console her, and, as Goethe said, Schiller and Humboldt also, she was a stranger to art. Her daughter Albertine said afterwards: "Mamma liked two things alone in Italy—the sea and Monti." She would give the Duomo of Saint-Peter for a "good Constitution." She afterwards, in 'Corinne,' modified a little these first impressions, but even in 'Corinne' the wrongs of the Italian people produce more effect on her than anything else.

In June, 1805, she returns to Coppet. She wishes to go back to Paris, and her blue lake has a rival in the "ruisseau de la rue du Bac." Napoleon is at the camp of Boulogne, and, amid his preparations for war, he has time to write to Fouché: "Madame de Staël says that I have allowed her to stay in Paris, and she means to stay there. . . . Tell her friends that she must halt at forty leagues from Paris. I must keep out of Paris all the elements of discord. It is not possible that, when I am 2,000 leagues away, at the extremity of Europe, I should allow bad citizens to agitate my capital." Fouché immediately requested the prefect of Geneva, M. de Barante, not to give Madame de Staël any passport for France, and to have her arrested if she insisted on going to Paris. All M. de Barante could obtain for her was permission to reside in Geneva, which was French at the time. She remained in Switzerland during the close of 1805 and the first months of 1806, finding some consolation in the company of M. de Barante, who made frequent visits to Coppet and was the most agreeable of men.

At the end of April, 1806, she travels with Schlegel and her two children, goes to Auxerre, to Blois, to Rouen. At the beginning of 1807, Fouché allows her to reside at twelve leagues from Paris, at a château belonging to M. de Castellane. Napoleon had not complete confidence in Fouché, and wrote to him from Pultusk on December 31: "Do not let that *coquine* of a Madame de Staël approach Paris; I know she is not far from it." And again, in March, 1807: "See that my orders are executed, and don't allow Madame de Staël to be nearer than forty leagues from Paris." He never forgets her: some letters of hers fell into his hands:

"You will see by this letter what sort of a Frenchwoman we have in her. She would have done anything in the world to see Prince Louis, our enemy, madman, and author of the ruin of his monarchy. . . . To-day paying court to the great, the next day patriot, democrat, one cannot but feel indignant at seeing all the forms taken by this ——, and ugly besides. I don't tell you all the projects already formed by her ridiculous coterie in case I should be killed. A prefect of police ought to know that. All that comes back to me from this miserable woman shows that she deserves to be left in Coppet, with her Genevese and her Necker family."

The extracts from Napoleon's correspondence with Fouché are all in that style. In one letter he writes: "You would be astonished if I gave you the details of all she has done in her campaign, since, though 500 leagues from France, I know better what is going on there than the prefect of police."

'Corinne' appeared in the last days of April, 1807. Madame de Staël in vain said that she had written a mere novel, without touching politics. "Bah!" said Napoleon; "politics! Do people not make politics when they write on politics, on literature, on anything else?" He said also: "I cannot forgive Madame de Staël for having lowered the French in her novel." One of the personages incarnates French levity in contrast with the perfect serenity of the Englishman Oswald, the hero of the novel. Corinne is anti-French and an Anglomaniac, and Corinne is Madame de Staël. At Coppet, whither she had been obliged to return, she kept a sort of court; her guests were Madame Récamier, Elzéar de Sabran, Benjamin Constant, Schlegel, Sismondi, Barante. Guizot, still unknown, was presented there, and read to her the famous article which Chateaubriand had just published in the *Mercure* (July 4, 1807): "It is in vain that Nero prospers; Tacitus is still born in the Empire; he grows unknown near the ashes of Germanicus, and just Providence has delivered to an obscure child the glory of the master of the world." In the silence of Europe these allusions had an immense effect. In this autumn of 1807, Prince Augustus of Prussia, then a prisoner of France, obtained permission to stay on parole in Switzerland, and made a visit to Coppet. It is well known that he there fell in love with Madame Récamier, and made her an offer of marriage. Napoleon was informed of all the details of this visit, and complains in a letter of the "evil spirits" which the Prince met at Coppet.

In January, 1808, Madame de Staël journeyed to Vienna, where she was very well received in all the aristocratic circles and attended all the lectures of Schlegel, who had declared a sort of open war against French influence, French literature, and French art, and exalted the old glories of Germany. This communion with the enemies of France deeply offended Napoleon. He was aware that Madame de Staël corresponded with Gentz, the agent of Stadion and of the English policy, subsidized at the same time by Austria and by England, the declared enemy of the French Revolution and of Napoleon. He looked upon her as his mortal enemy, and considered her a dangerous ally and instrument of the coalition which was forming against him.

Correspondence.

THE CINCINNATI MUNICIPAL ELECTION.

To the Editor of The Nation:

Sir: It seems rather unkind that the *Nation's* recent comment upon the failure to elect a respectable Citizens' ticket upon the 6th instant, in Cincinnati, should put into the mouths of the reformers the stock plea of the "machine," that it is not only a Mayor who is to be chosen but a possible Senator and President. The speakers for reform constantly ridiculed the proposition that any other interest was at stake than that of cleansing the foulness of an especially shameful city government, for which the Republican party management was wholly responsible; but, at the outset, Senator Foraker rushed to the conflict with the ancient alarm, "Elect Ingalls and you threaten Hanna," and all the machine papers took up the cry, which usually has a strangely powerful effect upon many otherwise fairly intelligent voters. The issue of reform was simple and clear, and was so presented by all the advocates of the Citizens' ticket. G. A. T.

Cincinnati, April 11, 1903.

SCRIPTURE FOR IT.

To the Editor of The Nation:

Sir: It has always been my conviction that the boycott was a device of the devil, but I did not know till recently that I had Biblical authority for it: "And he causeth . . . that no man should be able to buy or to sell, save he that hath the mark, even the name of the beast or the number of his name" (Revelations, xiii. 17, Revised Version). J. M. H.

April 7, 1903.

ORANGE EATING ONCE MORE.

To the Editor of The Nation:

Sir: In one of my letters from Jamaica (*Nation*, No. 1966) I said: "A charming young woman once told me that the only way to eat an orange was to lock yourself in your room and eat it." That was twenty years ago, and the young woman is now a stately matron; but the method to which she thus covertly alluded forms (as my colleague, Prof. John Williams White, points out to me) the substance of what may be called the *locus classicus* on this subject, a passage in Mrs. Gaskell's 'Cranford,' which appeared just half a century ago. It occurs near the middle of the third chapter, and runs as follows:

"When oranges came in, a curious proceeding was gone through. Miss Jenkyns did not like to cut the fruit; for, as she observed, the juice all ran out nobody knew where; sucking (only I think she used some more recondite word) was in fact the only way of enjoying oranges; but then there was the unpleasant association with a ceremony frequently gone through by little babies; and so, after dessert, in orange season, Miss Jenkyns and Miss Matty used to rise up, possess themselves each of an orange in silence, and withdraw to the pri-

vacy of their own rooms to indulge in sucking oranges."

My words on this innocent subject have evoked so much comment, written or oral or printed, that I venture to think your readers will pardon my reverting to it, and the more readily if, in so doing, I remind them of a book the delightful reprint of which was justly praised in your columns.

C. R. LANMAN.

ORIGIN OF "CAHOOT."

TO THE EDITOR OF THE NATION:

SIR: The origin of the colloquial word *cahoot* is a puzzle. It is used in the singular or plural in such expressions as "to be in cahoot (cahoots) with a person"—that is, "to be in partnership or to have a secret understanding." I have heard also "to knock out of cahoots," meaning, "to bring into disorder." Some authorities say the word may be a perversion of French or Spanish *cohorte*, "company," "gang," while the Standard Dictionary suggests the French *cahute*, "cabin." From a philological standpoint this derivation seems more reasonable. The word is attributed to Southern and Western United States, but I am sure it is used in central New York. Perhaps some of your readers can furnish information as to its etymology and the history of its use.

CHARLES BUNDY WILSON.

THE STATE UNIVERSITY OF IOWA, IOWA CITY, April 4, 1903.

Notes.

A monument to Félix Gras is to be erected in Avignon by the Félibrige, the society—founded nearly fifty years ago by Mistral and Roumanille and Aubanel, with four other Provençal poets less widely known—of which Gras was the chief officer, the *Capoulié*, at the time of his death. The commission for the monument has been given to the author's son, Jean Pierre Gras, who already has ranged himself among the most promising of the younger French sculptors. The fame that Gras won at home came to him, curiously enough, from abroad. His 'Reds of the Midi,' with its sequels, translated from the Provençal by Catharine A. Janvier, was published first in English; and not until it had gone through several editions in this country and in England was it published in Provençal. Still later, he himself translating it, it was published in French. In the end, the work had its great success in France, and received official recognition in the grant to its author of the rosette of the Legion of Honor. Gras never received that decoration which to a Frenchman means so much. His rosette reached Avignon almost at the moment of his death, and he wore it in his coffin for the first and last time The hope is entertained that the fund now being raised to erect a monument to Gras in his home city may be increased by contributions from some of the many American readers to whom his work gave pleasure. In this hope the Félibrige has authorized Mrs. Janvier (who may be addressed in care of Messrs. D. Appleton & Co., No. 436 Fifth Avenue, New York) to receive subscriptions to the memorial fund.

M. L. Greenhalgh, 1135 Madison Avenue, New York, will publish next month for the Dibdin Club of this city 'Three Centuries of English Booktrade Bibliography (1595-1902)'; the first historical part answering to the title, from the pen of A. Growoll, and the second consisting of a bibliography of the catalogues, etc., published for the English booktrade in the period designated, by Wilberforce Eames of the Lenox Library. The edition will be from type, and limited.

The Diary of John Quincy Adams while a student in the law office of Theophilus Parsons of Newburyport, Mass., has been edited by his grandson, Charles Francis Adams, and will shortly be published by Little, Brown & Co., Boston, under the title, 'Life in a New England Town, 1787-1788.'

Ruskin's 'Comments on Dante,' with an introduction by Charles Eliot Norton, is in the press of Houghton, Mifflin & Co., along with 'The Correspondence between Ralph Waldo Emerson and Herman Grimm,' edited by Frederick W. Holls.

The American Unitarian Association, Boston, announces for speedy publication 'The Founder of Christendom,' by Goldwin Smith; 'Pioneers of Religious Liberty in America,' "being the Great and Thursday Lectures delivered in Boston in 1903"; 'Religious Freedom in American Education,' by Joseph Henry Crocker; and 'The Influence of Emerson,' by Edwin D. Mead.

Emerson's noble essay, 'Compensation,' is to be centennially published by Houghton, Mifflin & Co. in a limited edition. They have nearly ready the complete works of Alexander Pope, edited by Henry W. Boynton; 'The Flower Beautiful,' by Clarence Moores Weed; and 'Instructions concerning Erecting of a Library,' by Gabriel Naudé in John Evelyn's translation.

A revised and enlarged edition of Albee's 'Remembrances of Emerson' is to be issued in time for the centennial by Robert Grier Cooke, 70 Fifth Avenue.

'Evolution of the Japanese, Social and Psychic,' by Sidney L. Gulick, is announced by Fleming H. Revell Co., as also 'The Turk and his Lost Provinces,' by William E. Curtis.

Besides the first volume, "Macbeth," of Professor Liddell's Elizabethan Shakspere, Doubleday, Page & Co. promise the Memoirs of M. de Blowitz; a new volume of poems by Rudyard Kipling; a new book by Booker Washington; and a 'Color Key to North American Birds,' by Frank M. Chapman, with 700 illustrations.

D. Appleton & Co. will have ready by the end of May a posthumous novel by Frank R. Stockton, 'The Captain's Tollgate.' A memoir by the author's widow will accompany it, with a portrait and views.

From John Lane we are to have 'A New Portrait of Shakspere,' by John Corbin, with five illustrations.

'Oliver Cromwell, H. H. the Lord Protector, and the Royalist Insurrection of March, 1655,' by Sir Reginald Palgrave, will be shortly published by Sampson Low, Marston & Co., London.

A. C. McClurg & Co., Chicago, issue directly 'The Souls of Black Folk,' by W. E. Burghardt Du Bois.

Dr. Anton Bettelheim's 'Biographisches Jahrbuch and Deutscher Nekrolog' has been subsidized by the Prussian Government, and the four volumes 1896-1899 will now be continued uninterruptedly. For the intervening years, the editor and the publisher, Georg Reimer (Berlin, W. 35 Lützowstrasse 107), desire friendly contribution of data for the preparation of careful obituary notices of eminent Germans conformably to the original plan of this important and patriotic enterprise.

The recluse of Little Grange would heartily have approved the latest attempt to popularize his favorite Crabbe, whose poem 'The Borough' is now reprinted from the first edition of 1810, among the "Temple Classics" of Bell-Macmillan. Mr. Henry Williams, who supplies notes, has had in view a public needing to be told who Homer and Pope were; but, indeed, he had some difficulty in finding a pretext for notes to these village vignettes. The most welcome feature is Crabbe's portrait, from Chantrey's pencil sketch in the National Portrait Gallery — a rugged, weather-beaten face and fine forehead.

The same handy series further extends itself with Macaulay's 'Lays of Ancient Rome,' with nothing superadded from any other hand; and Goldsmith's 'The Bee, and Other Essays,' from the editions of 1759 and 1765, with Mr. Austin Dobson's oversight and annotation. There is a portrait in each case, Goldsmith's the familiar Reynolds; Macaulay's less well known. Mr. Dobson gives a list of the twenty-nine essays contained in the (second) edition of 1766.

A pocket volume smaller than the foregoing combines Matthew Arnold's General Introduction to Ward's "English Poets" and his critique of Stopford Brooke's 'Primer of English Literature' ('Essays on the Study of Poetry,' etc., Macmillan). The compound is worth taking.

Mrs. Gertrude Atherton's 'A Few of Hamilton's Letters' (Macmillan) is pretty certain of a favorable reception, we imagine, from a portion at least of the numerous public which has enjoyed 'The Conqueror.' The published writings of American statesmen belong, we fear, to the class of books much bought but little read, while the high prices which many of the standard editions command are, for most people, prohibitive. Mrs. Atherton's collection, of course, offers little to the specialist, but the eighty-four pieces —only fifty-five of them, by the way, of Hamilton's writing—give an instructive view of Hamilton's public activity. The most important letters are the one to Laurens telling of the André affair; the long letter to Duane, in September, 1780, pointing out the defects in the existing scheme of government and proposing remedies; the account of Hamilton's retirement from Washington's staff, in a letter to Schuyler; and the letter to Washington, September 9, 1792, apropos of the dispute between Hamilton and Jefferson while members of the Cabinet. The novelty of the collection is Hamilton's account, found in the Royal Library of Copenhagen, of the great West Indian hurricane of 1772. As the work of a boy of sixteen, the letter is remarkable; but the hysterical reflections, moral and religious, which make up the larger part of it, are a curious illustration of what, in that day, often passed for piety.

'Academic Honors in Princeton University' is a compilation of all such awards recovered from the records and the newspapers of the time. There are acknowledged and unavoidable omissions in the earlier years. To rehearse the names that afterwards became noted, especially those belonging to the first half of the life of the

college, would be merely calling a roll, for there is no space for comment; but it would be a distinguished roll. This compilation is a valuable contribution to a special class of records, with a direct interest for Princeton men. It has been carefully prepared and edited by John Rogers Williams, although, regardless of "the crime of 1896," the South East Club might find it difficult to identify the entry assigned to it (p. xxvii.). The publication reflects very high credit upon "The University Press" of C. S. Robinson & Co. of Princeton.

Justus Falckner (1672-1723), hitherto known as a minor hymn-writer, came from a line of Saxon pastors, entered the University of Halle in 1693, emigrated in 1700, lived for three years among the pietists on the Wissahickon, was admitted to the ministry at Gloria Dei, Philadelphia, by three Swedish clergymen "owning fealty to the archbishop at Upsala," and for the rest of his life was pastor of New York and Albany, with all the region between and outlying territory in New Jersey and Long Island. This pioneer worthy is now celebrated in a monograph by Dr. Julius F. Sachse (Philadelphia, printed for the author), offered as a "bicentennial memorial of the first regular ordination of an orthodox pastor in America." No reflection is perhaps here intended on the types of religion then prevalent in New York and New England, though Falckner's ministry aimed to protect his scattered flock from the errors of Calvinism, as his book of Instruction, printed by Bradford in 1708, sought "to uphold their faith and controvert the arguments of the Reformed"; yet "regular" and "orthodox" here evidently mean "Lutheran," for Dr. Sachse can hardly intend to lay stress on ordination by a distant bishop through a proxy. In 1703 considerations of doctrine might outweigh everything concrete and practical, but it is curious to see that view insisted on now. Apart from this peculiar claim, which is put forth as the *raison d'être* of the book, its quaint details and numerous illustrations have interest for students of early Pennsylvania history as well as for Lutherans.

There is no more devoted and patriotic work being done in America to-day than that of a group of teachers at Berea in the Kentucky hills. Every one who believes in expansion of the best type will therefore read with interest the account of the 'Birth of Berea College,' written by the Rev. John A. R. Rogers, himself one of the founders of the institution (Philadelphia: H. T. Coates & Co.). Mr. Hamilton Wright Mabie, in his introduction, truly calls this story "one of the spiritual romances of American life." The temper of the pioneers is sufficiently indicated by the three questions they put to themselves at the meeting constituting the college: (1) Is there a demand for a college in this region? (2) Are we the men called by God to carry it forward? (3) Is it to be wholly for God, and not for our own glory? The spirit in which the task was undertaken goes far to explain the fortitude with which it was continued even through the perilous times of the Kuklux Klan. When we wish to impress the foreigner with our educational zeal, it might not be amiss to tell him something of Berea.

To reap the advantages of peace, the Government of Cape Colony has produced, through P. S. King & Son, London, a truly attractive volume, 'Cape Colony for the Settler: An Account of its Urban and Rural Industries, their Probable Future Development and Extension,' edited by A. R. E. Burton, F.R.G.S., an experienced South African journalist. A description of physical conditions is followed by a chapter on lands and land laws, statistics of population, public debt, revenues, trade, transportation, constitution, etc.; others on fruit and rice culture, wheat and rust, lucerne growing, irrigation, dairying, sheep and goats, animals (including ostriches), etc. To this succeeds a gazetteer of the several divisions of the Cape in alphabetical order; and various appendices complete the information desired by the settler. There are maps of rainfall, and others showing the distribution of animals. Add twenty-nine photographic views of a practical nature, *e. g.*, that showing an ostrich hooded for the plucking. The relation between these birds and the lucerne on which they feed, and again between them and irrigation which ensures the lucerne crop; between these two factors, again, and the lucerne butter "that fetches the highest market price"—is one of many interesting revelations in this well-written manual.

It is perhaps not too late to call attention to a work which possesses additional interest through the recent appointment of its author to the position of French Ambassador to the United States. M. Jusserand's 'Les Sports et Jeux d'Exercice dans l'Ancienne France' (Paris: Plon) is dedicated to the contention, which it sufficently justifies, that the modern interest in sport is of French rather than of English origin. Its five hundred pages are replete with suggestive information in regard to the development of out-of-door exercises, and to their influence on character and social life, chiefly, of course, in France, but with continual references to contemporary conditions in England, whose history and literature are so familiar to M. Jusserand. The book has the fund of curious information and the charming style characteristic of its accomplished author.

The most attractive article in the *Annales de Géographie* for March is the illustrated account of the typical Picardy village, with its long street lined on either side with barns, the dwellings being at the back of the farmyard. The life, however, which led to these conditions is rapidly disappearing through the migration of the villagers to the towns. In one commune, consisting of 200 houses, only 42 were inhabited in 1901. Among the other contents are notes upon the geography and ethnography of a part of the French Congo and upon the natural resources of the Ivory Coast, the most promising of the West African possessions of France. In a sketch of the map changes occasioned by recent explorations in this region and in Liberia, considerable space is given to an attempt to show that the 'Narrative of a Journey to Musardu' is a pure fantasy, to be relegated to the class of fables. "Le livre a été publié à New-York par les soins de l'Institution Smithson, qui a distribué la plus grande partie de l'édition à ses membres. On s'explique mal cet intérêt singulier d'une institution privée d'Amérique pour le voyage d'un noir libérien dans son propre pays." But the Smithsonian Institution is in no way responsible for the book. Benjamin Anderson, a young man educated in Liberia, of pure negro blood, and at one time Secretary of the Treasury under President Warner, volunteered to undertake the exploration, the means being furnished by Messrs. Henry M. Schieffelin and Caleb Swan of New York. His narrative was printed by S. W. Green in New York in 1870, and, according to an introductory note by Prof. Joseph Henry, "the principal portion of the edition has been presented to the Smithsonian Institution by Mr. H. Maunsell Schieffelin, for distribution." Trübner put a portion of the edition on the market.

Prof. Max Koch of Breslau, who founded the *Zeitschrift für vergleichende Litteraturgeschichte* in 1886, has discontinued his connection with that learned organ of research in the field of comparative literature, and has founded a new journal, *Studien zur vergleichenden Litteraturgeschichte* (Berlin: Duncker), which is now beginning its third volume. The bibliographical supplement of Dr. A. L. Jellinek, which at first formed an integral part of the *Studien*, is now published quarterly as the *Bibliographie der vergleichenden Litteraturgeschichte*, by the same publishers. Professor Koch's old *Zeitschrift* has, however, not suspended publication, but is being continued under the excellent editorship of Prof. W. Wetz of Freiburg and Dr. J. Collin of Giessen, who have divided the responsibilities of their extended field, the former having charge of the studies in English and Romance, the latter in the Germanic literatures and folklore.

The "Reformgymnasium" scheme is evidently gaining favor among the educators of Germany, as the Frankfort and Altona schools, which best represent this type, are being imitated in the case not only of other secondary schools for boys, but of the majority of the Mädchengymnasia. Of the fourteen women's colleges, or secondary schools leading up to the universities, which have been established in Germany since 1893, only two, those of Königsberg and Munich, are modelled afer the old-fashioned classical gymnasium. All the others have "Reformed" courses, or a combination of these with the semi-classical Realgymnasium plan. The central thought of the Reformgymnasium is the substitution of a six years' course in the classical languages for the traditional nine years' course; the first three years before the study of the languages is begun being devoted to scientific branches. The total enrolment in these women's colleges is about four hundred, and they have a course ranging from four and one-half to six years, the completion of which entitles the graduate to a *testimonium maturitatis* of the university. Baden alone has, besides establishing regular girls' colleges, permitted girls to enter the classes of the boys' gymnasia, but this permission is limited to Pforzheim and a few other towns. The majority of these women's colleges were founded and maintained by women reform associations, chiefly the "Frauenbildungs-Reform." They exist in Carlsruhe, Berlin, Leipzig, Baden-Baden, Königsberg, Hanover, Stuttgart, Breslau, Munich, Frankfort, Hamburg, Cologne, Schöneberg, and Charlottenburg, in chronological order; the last seven having been established in the last three years.

The new educational budget of Prussia has set apart 57,000 marks for the estab-

lishment of a Royal Academy to be founded in the province of Posen, this being the latest method adopted by the Berlin authorities in the contest between the Germanic and Slavic elements in the eastern district of the kingdom. The academy is to establish regular scientific courses of instruction and lectures for the educated classes and the officials, and a series of popular courses and lectures for the masses, with admittance by special permission. Fees are to be charged, and the total income is to be used for books, appliances, etc. An extra donation of 30,000 marks is to cover the cost of initiating this work. Special buildings for the purposes of the academy are to be erected in the near future.

Mr. Ellsworth Huntington, A.B., Beloit, '97, has lately been awarded the Gill Memorial by the Royal Geographical Society of London, in recognition of his explorations while science master at Euphrates College, Harput, Turkey, 1897-1901. Mr. Huntington has been in the Graduate School at Harvard University since 1901, and has just been appointed Research Assistant by the Carnegie Institution. He will soon go with Professor Davis to join Professor Pumpelly for a summer of exploration in Turkestan.

A Harvard summer course in geology will be held in the mountains of southwestern Colorado under the direction of Mr. C. H. White, during July and part of August. Three scholarships of $200, $150, and $125 are available for the course, and are open to general application from teachers and students in any institution for men. A circular descriptive of the course may be had by addressing Mr. White at the Rotch Building, Cambridge, Mass.

The Italian Minister of Public Instruction has just issued an order that students of foreign nationality desiring to be regularly admitted to the first year in any Italian university, need present only a certificate showing that they have completed a course of study such as would admit them to any university in their own country in the particular faculty (arts, law, medicine, etc.) in which they desire to be enrolled in Italy. Students of Italian parentage and citizenship may also be admitted on the same liberal terms, provided they can show good reason for having completed their preparatory studies outside of Italy.

A correspondent writes:

"Every one knows that there is nothing further from the spirit and practice of the *Nation* than intentional injustice to any individual mentioned in its columns. Yet such a thing may occur by accident, as in the case of the poet James Vila Blake, whose recent volume of sonnets was reviewed in the issue of March 12, and the review commented upon by 'A. B.' two weeks later. Both reviewer and correspondent seem to have fallen into the trap set for the unwary who are content with half-knowledge. One can forgive the latter for his suspicion of plagiarism on the part of the poet, knowing nothing as he does of the volume under discussion save the two samples of verse quoted by the reviewer; but suspicions resting on such slight evidence had better not be rushed into print. If 'A. B.' will take the trouble to consult a copy of the book itself, he will find on page 2 of the notes that Sonnet lxxxvi. is ascribed by Mr. Blake to Lessing's fable."

—'The Georgian Period: A Collection of Papers dealing with "Colonial" or XVII.-Century Architecture in the United States,' edited by William Rotch Ware (Boston: American Architect and Building News Co.), is concluded at length with volume three. We have found little but praise to give to the work from the beginning, because it undertakes simply the business of record and preservation as completely and intelligently as possible, while hardly attempting criticism. With this aim in view, the editors have given to the book a not strictly uniform treatment. In some cases there has been writing in the form of monographs about special buildings—some church or country house, not much known and perhaps wholly "unpublished," described at once by camera and in words. In other instances, a general essay has been furnished, such as "The Greek Revival and Some Other Things," apparently by one of the editors, as the article is not signed; or, "Savannah and the Far South," by C. R. S. Horton. The diverse character of the matter furnished may best be exemplified by noting the appearance, in the final number, of a treatise on the Boston State House, made up of speeches by celebrated men, and essays contributed to the papers, at the time when there was talk of doing away with the "Bullfinch front" of the State House. Mr. Charles A. Cummings, author of that 'History of Architecture in Italy' which we value, the Rev. Edward Everett Hale, and Col. Henry Lee Higginson were these helpers in time of need, and it is recorded that the movement to save the State House was the immediate cause of the publication of No. 1 of the Georgian Period. No. XII., and last, ends with an "envoi" signed by the editor, William Rotch Ware, which gives thanks to those who have helped in the preparation of the work; and especially to Mrs. Thaddeus Horton for general papers on Southern work and her numerous photographs, some procured "through the use of her own camera." So ends the most important work on architecture yet produced in America—most important, because the only one in which a subject peculiarly American is treated in an exhaustive way. The dwellers in more historic lands than ours find means to produce special treatises of this kind in great numbers, and still those of us who are inclined to study architecture crave more and ever more special treatises, whether devoted to one building, to one geographical group of buildings, or to one class of buildings considered more logically with reference to their architectural character. Here in the United States there seem to have been but two opportunities for such specialized treatises: one of them would be devoted to the Spanish convents and missions of the West; the other, devoted to the English, to the transplanted English, architecture of the East and South, we have here before us.

—The Bibliographical Society in London, when it does not dabble with the present, keeps on doing sound and useful work in a quiet way. Little is heard of its publications, though they often represent hard study and careful research. The latest—the tenth of the illustrated monographs issued by the society—is a volume on 'Early Oxford Bindings,' by Mr. Strickland Gibson, printed at the Oxford University Press. The subject is full of interest. There seems to have been an important school of bookbinders in Oxford from the old monastic days, for the records go back to the twelfth century if the surviving examples of their work do not. That this school or guild became a powerful body is likely enough. It gave the name of Bookbinders to tenements and a bridge that figure in the old chronicles, while even to this day there is a Bookbinders' Yard in Oxford. The bindings are an eloquent proof that there were many accomplished craftsmen among these binders, of whose history Mr. Gibson gives a short sketch down to the middle of the seventeenth century. He has not allowed himself space to go into detail, nor has he endeavored to do more than collect the main facts and state them briefly. The bibliographer, as a rule, appears to have a rooted objection to writing anything that is readable, as well as reliable, though it is hard to say why. However, within the bibliographical limits he has set himself, Mr. Gibson's work is excellently done, and his book will prove of immense use to the student. For his introduction is followed, first, by a descriptive list of stamped bindings, arranged chronologically down to about 1516, and it is curious to find that the oldest, now possessed in the Bodleian, goes no further back than 1460, "or shortly after." Of the twelfth, thirteenth, and fourteenth centuries, there remain no examples that have as yet been identified as Oxford work. After this list come descriptions of the stamps, with measurements; a list of rolls arranged chronologically, from the beginning of the sixteenth century; some account of centre-pieces; a chronological list of the binders themselves, or of so many as are known by name; extracts from the Bodleian day books and account book; and, finally, fairly well reproduced examples of the bindings, as well as of the stamps and rolls used in their decoration. It will thus be seen how helpful the book must prove in the future to all those who make a study of the history not only of Oxford, but of the art of bookbinding. There is an ample index of persons and places mentioned, and also a list of illustrations and plates. In a word, the book is an admirable demonstration of the patience, skill, and industry of the modern bibliographers. As it has been issued in loose brown-paper covers, it gives a good chance to the enthusiast to have it bound in a manner worthy of the subject, and thus show that the art of bookbinding is not altogether dead.

—The fluctuations in the book salesroom are equalled only by those of the Stock Exchange. The Kelmscott Press Chaucer, which had virtually touched the hundred pounds mark in England, and this not much more than a week before, was sold the other day at Sotheby's in London for seventy-five pounds, a "slump" of nearly one-quarter in its selling price. Of course, it may go up again, there may be further fluctuations; but it looks as if the general tendency now would be downward. The reasons for this are evident. Not only is the "boom" of Morris on the wane, but there are two other causes for a decline in the value—that is, from the collector's standpoint—of his Chaucer. First, when it is considered that, within a few days in the same salesroom, a unique copy of Dante, with the illustrations attributed to Botticelli, brought only a thousand pounds, it is utterly absurd that

one copy of a book of which an edition of four hundred and twenty-five on paper and thirteen on vellum was published only a few years ago, so that all the copies are still in existence, should bring one-tenth of this figure; especially as many copies are changing hands, like shares, all the time. And, again, it is by degrees becoming more widely known, though it has been perfectly well known to booklovers in England all along, that the drawings for the Chaucer were really not by Burne-Jones. This artist made a series of rough pencil notes, suggesting the subjects and the composition, and they were then carried out by Mr. Catterson Smith and others, who turned the slight pencil sketches into elaborate compositions in pen-and-ink or pencil. The book may be, or rather is, after its fashion a truly magnificent example of printing, but, artistically, Burne-Jones had very little to do with it—how little, whoever saw his pencil sketches when they were exhibited in some of the London galleries must know. They were hints and suggestions, and not much more. And as it is partly for the illustrations that the book has been prized so highly, this fact must in the end make a difference.

—The Oxford Dictionary now takes a hand in the Bacon-Shakspere controversy, pointing out, in its current issue, the great extension of the use of *out-*, "as a prefix forming verbs with the force of surpassing or outdoing," which began about 1600. Shakspere's part in this, continues the editor, "as our earliest authority for many *out-*verbs, and the introducer of the phrases of which the earliest types are 'our prayers do out-pray his,'" is preëminent, whereas "phrases of this kind, and, indeed, *out-*verbs as a class, were apparently eschewed by Shakspere's contemporary, Bacon." "Shakspere uses fifty-four of these verbs, for thirty-eight of which he is our first, and for nine of them our only authority"; but "we cite Bacon only for two," and one of these had been in common use in archery for seventy years. Ben Jonson "used the *out-* verbs nearly as freely as Shakspere, without, however, yielding anything like the same number of first instances." We owe to Dr. Murray's extreme courtesy the privilege of giving Shakspere's list complete beyond the limits of the Dictionary's instalment (Onomastical-Outing). The verbs in italic occur first in Shakspere; those in small capitals, first and alone in him: Outbed, outbrag, outbrave (first in special sense), *outbreath* (put out of breath), *outburn*, OUTCRAFTY, *outdare*, outdo (special), OUTDWELL, outface, outfly, OUTFROWN (and in nineteenth-century echoes), outgo, *outgrow*, OUT-HEROD, (nineteenth century), OUTJEST, outlaw, outlive (special), *outlook*, *outlustre*, OUTNIGHT, OUTPARAMOUR, OUTPEER (nineteenth century), *outpray*, *outprize*, outride, *outroar*, outrun (special), *outscold*, OUTSCORN, *outsell*, *outshine*, outsleep, outspeak, OUTSPORT, outstand (special), *outstare*, *outstay*, outstretch, outstrike (special), outstrip, *outswear*, OUTSWEETEN (nineteenth century), outswell (special), *out-talk*, *out-tongue*, OUTVENOM, outvie, OUTVILLAIN (nineteenth century), *outvoice*, *outweigh*, outwear, outwork, OUTWORTH. Bacon's brief list is: Outcompass and outshoot. Dr. Murray remarks that in 1800 Shakspere alone could be cited for fourteen words on his list; in the next century five of these reappear as echoes. Indeed, thanks to Scott, who was "to a large extent the discoverer of Shakspere," the reverberation has gone on ever since the Romantic revival.

—At a timely moment there reaches us a new edition of the Latin version of that Dutch morality, "Elckerlijck," which, under the English name of "Everyman," has lately been attracting no small audiences of the elect in several American cities. This is the version called "Homulus" by its author, who was apparently Christian Stercke (alias Ischyrius), first published in 1536. Between then and 1548 it passed through at least eight impressions, and is now reëdited by Alphonse Roersch (Ghent: Librairie Néerlandaise), who a few years ago discovered in the archives of Maestrict about all that is known of "meester Christaen," the struggling pedagogue-in-chief of that unappreciative town. In his introduction, Roersch gives a bibliography of "Homulus," the variant readings of five editions, and a few pages of notes on the language and style of the version. There are also several reproductions of woodcuts with which the first edition was adorned. The little book, a pamphlet of some hundred and odd pages, will be welcomed by many students at our universities whose interest in the various forms of this morality has recently been stimulated by the remarkably successful performances of "Everyman" to which we have referred. We may add that the new firm of Fox, Duffield & Co., in this city, make their first bow to the bookish public in a handsome reprint of the "Everyman" now being produced. The form is appropriately reminiscent of the Elizabethan quartos: the cream-toned paper, old-faced type, and gray board covers, all most tasteful. The text is reprinted from Hazlitt-Dodsley, and the illustrations are selected from John Skot's edition of 1529. The erudition of the slight introduction is somewhat ragged, and, since such a text is not for the unschooled public, one could wish that one of the old editions had been followed *literatim*, rather than the presumably bad Hazlitt-Dodsley version. But here it is, at any rate, the best of the old moralities, easy to read and fair to look upon.

—Paris, as we remarked the other day, apropos of the commotion in the Louvre over the tiara, is a great centre for the forging of antiquities. There has just been discovered in the suburbs a thriving factory for the fabrication of Egyptian mummies, cases and all. These were then shipped to Egypt, and in due time returned as properly antique corpses. As regards mediæval antiquities, a very funny story is now current. A certain clever workman in stone made to the order of a dealer in mediæval antiquities a Venetian chimney-piece of the fifteenth century, and received for his work some two or three thousand francs. The dealer shipped the chimney-piece to Italy, and had it set up in a palace near Venice, bringing back to Paris photographs of the palace, and of the chimney-piece *in situ*. By means of these photographs he aroused the interest of a rich collector, who sent his secretary to Venice to make sure that the photographs did not lie, and, on his favorable report, bought the thing for 50,000 francs. On the arrival of the article at his house in Paris he sent for some workmen to open the cases. One of them appeared to him to go about the work rather carelessly, and he remonstrated with the man, who answered: "Have no fear, sir; I know just how it needs to be opened, for I packed it when it left Paris."

—There has been of late a kind of symposium in some of the French reviews on the state of their journals. The conclusion, as stated by M. E. Pierret in the *Réforme Sociale*, is excessively gloomy. The *Débats* and the *Temps* alone maintain a creditable position; the rest are decadent to the last degree. Not that there is any lack of literary skill—the writing is clever enough—but the subjects treated are petty and vile. There is no foreign news, no foreign correspondence; if anything of this kind appears it is borrowed from the *Temps*. Some of the German papers publish in a single dispatch more words concerning a session of the French Chamber than a French paper will publish in a month concerning all that takes place in Germany and in Austria. A newspaper is properly supported by its advertisements, but the French papers have killed the goose that laid the golden eggs. Girardin, when he inaugurated the cheap press maintained by advertising in 1835, said, "La quatrième page est un mur, y affiche qui veut." But the temptation to win a brief advantage by concealing advertisements under the guise of reading matter has proved too strong, and, as a result, advertising has fallen off. Deprived of this legitimate support, the press has felt obliged to prostitute itself. It resorts to blackmail; it sells its speech for silver and its silence for gold. It was paid for swindling the public concerning the Panama Canal; it was paid for keeping silent for two years concerning the Armenian massacres. The criticism of books, pictures, plays, is bought; what is not paid for is ignored. But what is so easily bought is not worth paying much for, and venality has had to be more and more supplemented by "pornographie." Here the lowest depths would seem to have been reached; the limit of revenue attainable by corruption has been touched. In spite of M. Pierret's rhetorical exaggeration, his witnesses bear out his case, and we can but shudder at the lessons now taught the French people by what is the most effective, and should be the most elevating, of educational agencies.

GENERAL GREENE IN SOUTH CAROLINA.—I.

The History of South Carolina in the Revolution, 1780-1783. Volume IV. and last. By Edward McCrady. Macmillan. 1902. Pp. xxvii., 787.

At the close of the third volume of his great history of South Carolina, in which the account of the Revolutionary War was brought down to the end of 1780, Mr. McCrady threw out a hint that his treatment of the succeeding period, when American military operations were under the direction of Gen. Nathanael Greene, would not be in the eulogistic strain hitherto common, but would seek to do justice to the partisan leaders whose exploits the author had already dwelt largely upon. The volume now before us, completing Mr. McCrady's undertaking, fulfils this promise with truly

extraordinary vigor and assertiveness. The book is, in fact, one long indictment of Greene, in which his personal character, his military career, and his attitude towards the Southern leaders are attacked with a severity and bitterness not easily paralleled in recent historical writing of the larger sort. Those who have read Mr. McCrady's previous volumes are already aware of his positiveness of expression, his confidence in the soundness of his own positions, and his extreme sensitiveness about the honor and achievements of his State; but they will hardly be prepared for so extreme a setting forth of the case against Greene, or so sneering a depreciation of Greene's motives and work, as run through the present volume from cover to cover.

Mr. McCrady's indictment of Greene, though touching upon nearly every detail of the latter's public life in the South, relates principally to six points: first, Greene's fitness for his position as commander of the Southern Department; second, his attitude towards the partisan leaders, especially Sumter; third, his distrust of militia and confidence in the superiority of regular troops; fourth, his military achievements and reverses; fifth, his relations with the Government and people of South Carolina, particularly during the period just preceding the evacuation of Charleston; and, last, his connection with the firm of Banks & Co. The evidence adduced on these several points, scattered as it is throughout a large volume excessively packed with detail, cannot possibly be presented with much fulness within the limits of this review, and is difficult to summarize with much brevity. The importance of Mr. McCrady's book, however, as the most significant contribution lately made to the literature of the American Revolution, as well as the truly extraordinary manner in which he has performed his task, seem to justify a discussion of the case at somewhat more than usual length.

It will be recalled that some two months after the defeat of Gates at Camden, Washington, in response to a resolution of Congress, appointed Greene to take command of the Southern Department. It is at this point that Mr. McCrady's narrative begins, and it is with regard to Greene's qualifications that the first count of the indictment is framed. It is pointed out that Greene had reached the high rank of major-general "without ever having been engaged in battle" (p. 3), and that his administration of the quartermaster's department, though approved by Washington, had not been characterized by "any marked success" (p. 4). The account of Greene's connection with the firm of Barnabas Deane & Co., though relegated to a lengthy footnote as having no direct bearing on the history of South Carolina, is nevertheless so put as to show the author's reprobation of the transaction; and emphasis is laid upon the fact that although, at the time of his appointment to the South, Greene's experience had been considerable both in the field and in the administrative department of the army, he had not as yet "exercised an independent command, nor conducted a battle except under the eye and direction of another" (p. 5). From the facts as stated there can be, of course, no dissent, but they do not give us quite the whole story. Greene, to be sure, was a subordinate, as most military men must always be, but he was the most trusted by Washington of all the American officers; and although he had never exercised an independent command, he had been, as one of his biographers points out, in every battle in which Washington had commanded, except White Plains. That Washington, whose opportunities for observation would probably be admitted to have been considerable, believed that Greene had in him the making of a competent commander, would seem to be evidenced by his choice of Greene to take charge of a department in regard to which, owing to the lack of information, Washington "could give no positive instructions, but must leave [him] to govern himself entirely according to his own prudence and judgment" (p. 7). It is not without significance, either, as showing the general esteem in which Greene was held, that so many of the ablest officers sought to accompany him.

This, however, is a comparatively minor matter, chiefly noteworthy as showing at the outset Mr. McCrady's attitude towards Greene. The second count is more serious, and, in some respects, the most important of all. It is charged that Greene both underestimated and depreciated the importance of the partisan leaders, deprecated their mode of warfare, and slandered them in private while praising them publicly. The further charge that Greene set little store by militia or partisan volunteers, and put reliance only upon regular troops, is so interwoven with the charge of hostility to the popular leaders that the two may conveniently be considered together. The complaint about the militia, it will be remembered, is not new, but runs through a large part of Mr. McCrady's third volume, and colors much of his criticism on the earlier conduct of the war. The evidence most frequently cited by Mr. McCrady to prove Greene's dissent is his letter of January 8, 1781, to Sumter, in which, after expressing his sympathy for Sumter, then suffering from a wound, he continues:

"When I was with you your soul was full of enterprise. The salvation of this country don't depend upon little strokes, nor should the great business of establishing a permanent army be neglected to perform them. Partisan strokes in war are like the garnish of a table. They give splendor to the army, and reputation to the officer, but they afford no substantial national security. . . . The enemy will never relinquish their plan nor the people be firm in our favor, until they behold a better barrier in this field than a volunteer militia, who are one day out, and the next at home. . . . It is not a war of posts, but a contest of States dependent upon opinion" (pp. 61, 62).

Mr. McCrady is unmeasured in his denunciation of Greene for writing this letter, and again and again returns to it, or quotes its striking phrases, often with sneer or fling, as his narrative proceeds. There was, he says,

"some general truth, of course, in all this. But why should Greene have taken this occasion to remind Sumter of these elementary principles of warfare? . . . What had Sumter to do with the great business of establishing a permanent army? . . . This long and carefully prepared and studied letter must have been written for a definite purpose. It must have been designed to influence Sumter's conduct in some way. The only effect which the letter could produce was to dissuade Sumter from striking any more partisan blows. . . . Was it true that at present the war was not one of outposts? . . . This letter was written either in ignorance of what had taken place in South Carolina during the last six months, or in want of appreciation and disparagement of the great results which had been accomplished" (pp. 62-64).

As between Sumter and Marion, the latter was Greene's favorite, but Mr. McCrady quotes letters to show that "in his private correspondence Greene was accustomed to sneer at both." Thus, writing to Marion on April 24, Greene, after extolling Marion's achievements, declares: "I shall miss no opportunity of declaring to Congress, the Commander-in-chief of the American army, and to the world in general, the great sense I have of your merit and services" (p. 178). Two days before, however, as Mr. McCrady observes, Greene had had an opportunity, and had written to Washington this "lukewarm and indifferent report":

"The conflict may continue for some time longer; and Generals Sumter and Marion, and many others, deserve great credit for their exertions and perseverance, but their endeavors rather seem to keep the contest alive, than lay any foundation for the recovery of these States."

Of similar purport is Greene's letter of May 4 to Governor Reed of Pennsylvania.

It would be wearisome to cite the numerous instances in which Mr. McCrady recurs to this point of attack. Depreciation, innuendo, and sneer have seldom been more persistently used in an important historical work, or with so strong a suggestion of personal hostility to his subject on the part of the author. It is no part of a reviewer's task in this instance to defend Greene or even to purge his conduct of seeming inconsistencies. Yet something weighty is to be said on the other side. It is not to Greene's discredit that he should at the beginning have misunderstood the conditions and character of the struggle in the South, or that, when he came to know more of it, he should have felt the impossibility of continuing resistance mainly by the methods heretofore in vogue. There can be no doubt that Greene always viewed the presence of partisan bands, under leaders whose relation to himself as commander-in-chief was at best uncertain, as an embarrassment, and that he was more than once undecided as to their proper place in a comprehensive plan of campaign. It was his duty as commander of the Southern Department to take a large view of the situation, and plan his movements with regard to all the interests involved. The partisan bands, able as was their leadership and important as were their services, were, after all, irresponsible bodies of guerillas, acknowledging but precarious allegiance even to their leaders, serving without pay and for irregular periods, living off the country, and more and more degenerating, as Mr. McCrady himself admits, into lawless plunderers. That they were increasingly a terror to the regions in which they operated, is as certain as that they administered substantial punishment to the British. Mr. McCrady censures Greene for attempting to do the one thing that he was bound in consistency to do, namely, to bring order and victory out of chaos and defeat, to substitute a central authority and control for temporary allegiance to a popular chief, to direct the movements on the outskirts so as to make them harmonize with the movements at the centre, and to create an American army fit to cope with the veterans of Cornwallis.

Greene, in short, planned for war, while Sumter planned only for offensive operations. It is clear from Mr. McCrady's own narrative that Greene had a just appreciation of the value of the partisan bands and realized the necessity of partisan warfare, but as subsidiary to his main purpose and not as the principal element in it.

We do not read Greene's letters in so unfavorable a light as does Mr. McCrady. The letters of April 22, to Washington, and May 4, to Reed, when read as a whole in Johnson's Life of Greene, are comprehensive reports on the military situation and outlook; the references to Marion and Sumter, on which Mr. McCrady is so severe, being rather incidental and by way of illustration than in any tone of personal depreciation. It was the facts that were disagreeable. The famous letter of January 8, again, when read as a whole and without bias, seems rather an attempt to lay out to Sumter the general plan in Greene's mind, and secure his coöperation, than a "treatise" intended to "discourage" Sumter from striking any more partisan blows. Even Mr. McCrady admits (p. 65) that the last part of the letter "shows that Greene was not ignorant of the great difference between the men whom Sumter led and the ordinary militia."

This significant passage from Greene's letter, which is too long to quote, and which Mr. McCrady leaves without further comment, suggests another cause of difference between Greene and Sumter. Although Greene seems clearly to distinguish between the militia properly so called and the partisan bands, he apparently for some time imagined that the partisan leaders could, if they chose, bring into the field a considerable and definite number of men, and so far control them as to admit of their employment in extended operations. This "radical misconception" of Greene, as the author calls it, was at least not unnatural, yet it early opened the way for serious misunderstanding between Greene and Sumter, in which, if we are to follow Mr. McCrady, Greene was the most to blame.

There were added to Greene's embarrassments sharp personal differences among the partisan leaders themselves, particularly between the most famous of them, Marion and Sumter. That these differences were but natural outgrowths of unrestrained guerilla warfare is, of course, evident, but they were also accentuated by the personal qualities of the men themselves. Mr. McCrady, whose admiration for Sumter shows few bounds, admits that he was of "quick and impetuous temper" (p. 167), indisposed to "brook interference" (p. 243), restless under discipline and restraint, and not friendly to the idea of a superior; in short, a difficult person to get on with. The fact that Marion was Greene's favorite, and that the exploits of Morgan and Lee, under Greene's direction, rivalled in daring those of the partisan leaders themselves, doubtless made Sumter somewhat jealous. Nor can Greene be wholly acquitted of blame. He had obvious infirmities of temper. He was impetuous and outspoken, and prone to speak of others, especially in private correspondence, with a frankness indicative of imperfect self-control. Mr. McCrady has certainly made the most of such incidents, but more impartial historians will, we think, agree that, while Greene's outbursts are regrettable, they are not in this case the whole of life. Unless it can be shown—as we believe it cannot—that Greene's impatience with Sumter's independence was a predominating factor in the former's conduct as a military leader, and unwarranted by the actual facts of the case, it should not, we think, be much dwelt upon. Few are the great men who cannot be made ridiculous by constantly exhibiting them at their worst. And one need not go beyond Mr. McCrady's own pages to find sufficient refutation of his general estimate of Greene, and important modifications of his insistent exaltation of Sumter.

CLIMBS IN THE HIMALAYA AND ELSEWHERE.

Mountaincering in the Himalaya and Other Mountain Ranges. By J. Norman Collie, F. R. S., Member of the Alpine Club. Edinburgh: David Douglas; New York: Charles Scribner's Sons. 1902.

England produces a smaller quantity of printed matter relating to mountain climbing and mountain exploration than does Germany with her copious magazine-records devoted to the subject. But she produces more books about climbing than does any other country, the United States included; from which fact one may apparently conclude that the number of "general readers" who care for the subject is larger in England than in other European countries. Mr. Collie's book is chiefly devoted to the Himalaya, though he has chapters upon the Canadian Rockies and upon the Lofoten Isles in Norway, as well as stray notes upon some of the mountains of England, Scotland, and Ireland.

Mr. Collie was one of the three well-known and experienced climbers who set off some years ago to explore, and if possible ascend, one of the loftiest and most impressive peaks in the northwest Himalaya, a peak more accessible than any other of the great summits, because it stands rather detached and is entirely in territory subject to British influence. The highest peaks of all lie on the frontier of Nepal and Tibet, regions both of which are closed to Europeans by the political jealousy of the native governments. The next highest group, sometimes called the Mustagh, near the Karakoram Pass on the frontier of Kashmir and Turkistan, rise out of an almost uninhabited wilderness, whose valleys are filled by vast glaciers; and it is necessary to carry provisions a very long way into these wastes in order that the explorers may be able to reach even the foot of the glaciers. There are really only three parts of the Himalaya where exploration can be conducted without political difficulties. One is the small protected State of Sikkim, north of Calcutta, which was fifty years ago visited by Sir J. D. Hooker, and described in one of the best books of scientific travel ever written—his 'Himalayan Journals.' Here stands the magnificent mass of Kinchinjunga, sixty miles from the British Hill Station of Daijiling, but so difficult of approach, owing to the nature of the country, that it takes many days' journey and an expense of thousands of dollars to carry an expedition to a point from which the ascent could be attempted. A second district is Kumaon, north of Oudh, a district under direct British control, but one where the snow-peaks lie so far back that approach to them is no less tedious and costly than in Sikkim. Neither do they reach the altitude of the Sikkim summits. Of the third or Karakoram region we have spoken already. There remains Nanga Parbat, the mountain to which Mr. Collie and his friends Messrs. Mummery and Hastings devoted their efforts. It lies in Kashmir, a huge territory under British influence, where Europeans who have obtained the leave of the Government of India can travel as freely as within the British dominions themselves. Its height is 26,629 feet above the sea, nearly 3,000 feet less than the highest of the Nepalese or Tibetan summits hitherto measured, but at least 2,000 feet above any point yet reached by human foot. It stands due north of the Lake of Kashmir, and just south of the Indus at the point where that great river turns downward its course from west-northwest to southwest.

The English party approached Nanga Parbat from the southeast, and journeyed along its southern face, seeking a point at which it appeared possible to scale its formidably steep slopes. They had to cross some very lofty passes, and experienced, like other travellers, much difficulty in supplying themselves with provisions, for the native villages are usually far below the snow line, which is approached only by a few herdsmen in the summer. Finding the southern side of the mountain unpromising, they crossed a pass at the western end, and reconnoitred the northwest face. Here Mr. Mummery, one of the party who had made a great reputation in the Swiss Alps by his extraordinary daring and skill as a climber, attacked the mountain with a Gurkha attendant, Mr. Collie being ill at the time, and the third member of the party absent endeavoring to bring up provisions. The Gurkhas are by far the strongest and boldest climbers among the various races that inhabit the Himalayas; rather small men, but extremely muscular and active, and very trustworthy. After some hard and dangerous rock climbing, Mummery reached a height of more than 20,000 feet, and believed that he might, by camping out on the rocks, have reached the summit on the following day, for the upper slopes of the mountains seemed less steep than those he had already ascended. However, his Gurkha was taken ill and could go no further, so he returned to the glacier below, where Mr. Collie awaited him. A day or two after, unwilling to abandon hope, he set out with two Gurkhas to cross a pass nearly 20,000 feet high, which would, he hoped, carry him into another valley further east, from which it might be possible to find an easier way up Nanga Parbat. Mr. Collie, taking an easier though longer route, was to meet him in that valley after two days. However, when Mr. Collie reached the trysting-place, there was no sign of Mummery or his men. Seen from this valley, the northeastern side of the pass, down which the venturesome climber would have had to come, seemed impracticable, so Mr. Collie and his party turned back to the camping-place at which they had parted from Mummery, expecting to find that he had returned thither. He was not there, however, and from that day to this no trace of him or his companions has ever been discovered. Probably they

were killed by an ice avalanche in ascending the pass; but in this region of gigantic glaciers, snow-fields, and precipices, all on a scale far huger than that of the Alps, there are many perils, any one of which might have proved fatal. Mummery, who was deeply regretted by his colleagues of the English Alpine Club, was, we believe, the first—perhaps he still remains the only—European climber who has perished by an accident in the Himalayas. If any one could have succeeded in reaching one of these tremendous pinnacles, it might well have been this exceptionally active, skilful, and adventurous mountaineer. There is no reason to think that it was to the rarity of the air that he succumbed; and in point of fact some Europeans have gone higher. Sir Martin Conway's party in the Mustagh group attained 22,600 feet; Mr. Graham in Sikkim would seem to have reached the top of Kebru, 24,000 feet, a little higher than Aconcagua in the Andes, which has been several times ascended, and whose ascent is difficult chiefly owing to the rarity of the air and the severity of the weather, for the slopes are not particularly steep.

Mummery and several others who have explored the Himalayas, such as Mr. Collie, Sir Martin Conway, and Mr. Douglas Freshfield, do not despair of scaling even Kinchinjunga, and that still higher summit of the Eastern Himalaya which is called by the Tibetans Lapti Chang, by the Nepalese Gaurisankar or Devadhunga. It is no doubt true that careful and continued examination has enabled practicable routes to be found up many mountains formerly held inaccessible; true, also, that the physical powers of man can be greatly strengthened by long practice in high altitudes. Nevertheless, the difficulties experienced both on Aconcagua and by Sir Martin Conway's party on the Karakoram Himalaya show that when a height exceeding 20,000 feet is passed, the strain on heart and lungs and the disturbance of the digestive organs become so serious that the progress made upward is extremely slow. It is consequently impossible to make more than, say, three thousand feet in a day; whence it follows that several nights must be spent at these enormous elevations, with the necessity of conveying a proportionately large quantity of provisions along with the party. Accordingly, while it is quite possible that at no distant date even a summit like Kinchinjunga may yield to the persistent energy of European climbers, there may still be many failures to record before the goal so long desired is attained.

Mr. Collie's descriptions are forcible and graphic. One of the best is that of the tremendous gorge of the Indus to the west of Nanga Parbat, between Bunar and the point where it issues from the hills a little above Attock. This gorge is some twelve thousand feet below the ranges which tower over it, and which in many places descend in sheer precipices. It is perfectly arid and barren, intensely hot, brown, and dusty, one of the most dismal and formidable pieces of scenery in the world, more terrible than the Grand Cañon of the Colorado River, because on a grander scale and because far less rich and varied in color. As Sir J. D. Hooker observed long ago, the Himalaya, though vaster and more magnificent than the Alps, are less beautiful just because nearly all the landscapes are too large to permit of those combinations of the various elements of beauty which make a landscape lovely. Valleys ten thousand feet deep do not give the same pleasure as does the Yosemite, still the most perfect piece of scenery discovered on the American continent.

Among the other contents of Mr. Collie's book, the most interesting is his account of sundry rock climbs in the very bold and sharp peaks of the Lofoten Isles. These peaks seldom exceed 4,000 feet, but, rising sheer out of the sea, they produce their full effect, and furnish landscapes of a singular variety and charm, to which there is nothing quite similar in the Old World. Indeed, the scenery of the Arctic coast of Norway is, with the possible exception of the Chilian coast north of the Straits of Magellan, the finest coast scenery that the world has to show. The Alaskan coasts have loftier summits and vaster glaciers, but the forms are not equally fine. We must not forget to add that Mr. Collie gives a short but attractive description of the scenery of the Canadian Rockies, where there are many unexplored glaciers and unscaled summits, sufficient to employ the energy and ardor of American climbers for many years to come.

MRS. WARD'S LATEST STORY.

Lady Rose's Daughter. By Mrs. Humphry Ward. Harper & Brothers.

Those who were fortunate enough to read 'Lady Rose's Daughter' without knowing anything about the life, loves, and letters of Mlle. de Lespinasse, enjoyed sensations of surprise and curiosity, sensations of which the wide advertisement of the novel's historical source has defrauded later readers. Mrs. Ward's name is identified with purposeful fiction, the sort that discusses serious themes and describes people pursuing an object, or objects, which the author believes to imply wider scope and higher aspiration than the mere living of one's own life and taking all one can get for self-gratification. Great, therefore, is the surprise of her accustomed reader (and, if he be also an earnest admirer, great the shock) to perceive in the earliest stage of acquaintance that Julie Le Breton, Lady Rose's daughter, is the sort of young woman to whom the vexed problems of humanity are conspicuously uninteresting; is indeed a free lance, an adventuress, born to fight for her own hand, and probably willing to use any weapons that seem expedient.

Surprise at Mrs. Ward's choice of a heroine is, of course, accompanied by curiosity about what she will do with her. For eighteen or twenty chapters she does very well, objectively at least, showing something of hitherto unsuspected ability to construct and develop a story in artist's fashion, smoothly, deliberately, making it interesting for its own sake and for the manner of presentation. She makes no capital out of current ideas or topics of general interest, and rather avoids preaching a cause or propagating a saving belief. It is true that this success is in description, not in characterization. As usual, Mrs. Ward flies very high and fails to realize her conception. Her characters are of the greatest world, adding to social position personal distinction as statesmen, diplomatists, soldiers, authors. Yet they never utter a thought beyond the capacity of a schoolboy, or turn a memorable phrase. Of Julie we are repeatedly told that her social grace and tact, though remarkable, are less powerful to charm than is her wonderful and brilliant talk. The specimens of her conversation vouchsafed are not above a drawing-room average; and, as for the methods by which she influenced Prime Ministers and other potentates to do her will, we have not so much as a glimpse at them actually operating. Nevertheless, Julie stands clearly for a genuine product of Nature, not perhaps one of her most creditable performances, but distinctly her own, created without reference to any artificial standard of perfection. Julie's insincere attitude towards her patroness, Lady Henry, her clever capture for intimate friendship of a self-willed young Duchess, her rejection, while the game of life was still to be played, of an uninteresting young man with a possible dukedom ahead—all this is extremely natural, as the triumph of her passion for the young soldier, Warkworth, over all hopes, plans, and ambitions, is a perfectly just inference from what precedes.

When Julie is actually started for Paris to join Warkworth, Mrs. Ward appears to have faced the consequences of her first conception, and the respect with which we have always firmly regarded her is tinged with a more enthusiastic sentiment. At this critical point another surprise awaits us. The author seems to stop to review what she has already done, to foresee with horror what she was about to do and what, with her blameless record on trial, she can never, never do. She takes fright, forsakes nature and probability, denies what we are supposing to be the work of her own hand, and invents a way out of the complication that shall make it possible for her Julie to become a perfectly respectable duchess. Without the key to the novel, it can only be supposed that Mrs. Ward has been led out of temptation and delivered from evil by a sense of duty to her position as a leader of thought and as a powerful influence for good in her native land. Persons of experience who have looked at life frankly, are strongly attached to theories about the force of temperament and logic of character. To such persons it is nonsense to say that a child of revolt and passion did, at the moment when revolt was strong within her and the passion of love consuming, turn aside from her destiny at the bidding of a moral and mystic young man (possible duke) whom she had twice refused to marry. But the class that Mrs. Ward professionally leads to higher things is not distinguished for perspicacity or renowned for unprejudiced observation of life. The mystic and moral young man round whom there "breathed the air of the heights" appeals to that class as a very probable worker of miracles, in which rôle, when it is known that he must one day be a duke, a wise, a beneficent duke, he becomes invincible. It is not inconceivable that many earnest, optimistic persons, thrilled by introduction to a family seat at the moment of its occupation by three dukes (two just dead and one just come to his own), may take in good faith Julie's offer to second her Duke Jacob's desired renunciation of his dukedom, should such sacrifice be per-

missible under the Constitution of his country. Still, when Duke Jacob perceives that it is his painful duty to remain a duke, it is no sign of depravity to believe that Julie discreetly "chortled" with unholy joy.

Once in possession of the history of Mlle. Julie de Lespinasse, both the unusual quality of the first half of Mrs. Ward's novel and the deplorable break in the middle are perfectly explained. The story up to its critical point is a modern English drawing-room adaptation of the life of an eighteenth-century Frenchwoman whose fame was made by the distinguished men who sought her society, and perpetuated by the publication of her ardent letters to a not very responsive lover. Mrs. Ward has made use of the facts of Mlle. de Lespinasse's life, has tried to reproduce her character and personal charm, and has closely copied some significant scenes. It is written of Mlle. de Lespinasse that, after her quarrel with the jealous and tyrannical Mme. du Deffand, when she had set up her rival salon and carried off the favored adorers of her former mistress, she embarked on a life *insouciante et même un peu galante*. The phrase states the fact delicately. Doubtless Mrs. Ward's conscience and her sense of public duty prohibited her borrowing from the abundant literature at her disposal descriptive of that sort of life; so just here she threw her model overboard, seized the tiller, and steered her story to smash on the reefs of her country's social code and literary convention. The right to borrow so liberally and add so little is perhaps a debatable point of literary ethics. Mrs. Ward does not seem to us to have passed the limit of justifiable borrowing, but she has sailed pretty close; one may even go so far as to say that she has not shown herself overnice.

The Religion of Plutarch. By John Oakesmith. Longmans, Green & Co.

"Plutarch," said Emerson, "will be perpetually rediscovered from time to time as long as books last." It is at any rate safe to assert that, at every stage in the history of thought when it becomes desirable to reconcile current religious beliefs with the conclusions of philosophy, the compromising method of Plutarch will be quoted with approval. He believed in the unity of God, and, like the latter Neo-Platonists, he tried to demonstrate the unity of religions, Hellenic and Oriental, and to relate his composite Deity to the visible world. His theory of intermediary demons goes back to Hesiod, though its interest for philosophy does not begin till Plutarch developed it from Plato. It paved the way for the marvellous in religion and philosophy, and that alone was enough to secure its popularity in the early Christian centuries. Plutarch realized the dangers of his conception and the ease with which it might degenerate into superstition; and, horrible as he considered either extreme, or in fact any extreme, he definitely prefers the atheist to the superstitious man. "The profoundest, the most essential, and paramount theme of human interest," says Goethe, "is the eternal conflict between atheism and superstition." Plutarch was a moralist rather than a philosopher, and his tract 'De Superstitione' is chiefly concerned to show that "a mere intellectual error," such as atheism, is to be preferred to the moral disorder of superstition. Yet the doctrine of demons, good and evil, opened the door to superstition, and in the theurgy which with its magical rites debased later Neo-Platonism, his demonology has much to answer for. His piety, his sincerity, his toleration—for the *odium theologicum* was inconceivable to his gentle spirit—have endeared him even to the Christians, whom he, curiously enough, ignores; so that we find John the Metropolitan of Euchaita, in an epigram that Plutarch would have thought to indicate a narrow sectarianism, making, at any rate, concessions to the author of the 'Moralia.'

"If any Pagans, Lord, Thy grace shall save
From wrath divine, this boon I humbly crave,
Plato and Plutarch save. Thine was the cause
Their speech supported: Thine too were the laws
Their hearts obeyed; and if their eyes were blind
To recognize Thee Lord of humankind,
Needs only that Thy gift of grace be shown
To bring them and bring all men to the throne."

Mr. Oakesmith's essay was written in its first form as a thesis for the degree of D. Litt. (London), and, even in the enlarged version before us, is not final. It is not easy, however, to see what material Mr. Oakesmith is reserving for the "more elaborate" book which he promises. The subject is one that has been well though briefly treated by Professor Mahaffy in his 'Greek World under Roman Sway,' though Mr. Oakesmith does not accept all Mr. Mahaffy's conclusions. On the other hand, Prof. Lewis Campbell, in his 'Religion in Greek Literature,' gave Plutarch scant notice. But Gréard in France and in Germany Volkmann have treated the subject with a fulness that leaves little to be desired, and in his essay of over two hundred pages Mr. Oakesmith offers nothing essentially new. It is a careful piece of work, perhaps too flattering to Plutarch, whom Mr. Oakesmith somewhat uncritically reveres. In accordance with the etiquette of the thesis, his footnotes give full references to what the Germans call the "Litteratur" of the subject, and, as is often the case, these are not the least profitable part of the book. Like too many theses, this one lacks an index, an omission which robs a piece of scholarly work of a great part of its usefulness.

The Great Siberian Railway. By M. M. Shoemaker. Putnams.

One of the first ideas naturally suggested by the above work is a comparison between it and J. F. Fraser's 'The Real Siberia,' reviewed last fall in these columns. Both are books of travel, of a common kind, by authors unfamiliar with the language of the country which they visited, and not overburdened with too much knowledge of any kind concerning it. Both writers confine themselves, in the main, to what they saw, but Mr. Shoemaker has added some general information about Siberia, taken, as he freely admits, from the English version of the official guide to the railway. His volume is therefore more instructive, and also his tone is more pretentious; indeed, he is rather too fond of reminding us that he has travelled before, which, however, does not seem to prevent him from grumbling a good deal about the ordinary discomforts incidental to a long journey in an out-of-the-way country. Unless the reviewer is mistaken, he has himself travelled in precisely the car used by Mr. Shoemaker, from Moscow to Irkutsk, and found it, if not what the Americans are so fond of calling "palatial," at least very endurable. Mr. Fraser had to rough it a good deal more, though at a better season of the year, and one of the merits of his account is its cheeriness. He spares us wearisome moralizing, and he does not allow his common sense to desert him in moments of fatigue; and thus he is never guilty of such absurd remarks as, "I fancy a century hence will see little change in Siberia." Siberia is not a paradise, and will never be mistaken for one; but it has vast possibilities, and its resources are being rapidly developed at the present time.

When Mr. Shoemaker (or his guidebook) keeps to the domain of concrete fact, there is little to criticise in what he tells us. The number of his typographical errors is small, and there are not many of his statements to which one must take exception. It is going too far to say (p. 39) that "Siberia is almost a windless land," for, though in most regions the Siberian winter is a still one, the steppes are often windy enough, and the extreme north suffers from the storm called the *purga*. The author was also misinformed (p. 41) about there being a branch railway line from Omsk to Tobolsk. None such exists. In speaking of the colonists of the Trans-Baikal, he says they are called "little Russians," which leads us to suspect that he does not know that the "Little Russians" are one of the three recognized divisions of the Russian nationality, and that they number more than twenty millions. Many of the recent emigrants to Siberia have, it is true, come from their ranks.

In the last part of his book, Mr. Shoemaker tells of a flying trip to Corea, and repeats the story of the shocking murder of the Queen, seven years ago, and his final chapters are devoted to a sketch of his visit to Pekin and the surrounding country. The whole volume may be of service to people wishing to make the same trip, but conditions on "the Great Siberian Railway" are changing so fast that any description of them soon becomes antiquated.

St. Augustine and his Age. By Joseph McCabe. New York: G. P. Putnam's Sons. 1903.

Mr. McCabe's portrayal of St. Augustine possesses much of the vivid dramatic interest which attracted us in his earlier life of Abélard. In a sense the books are companions and complementary studies; and Mr. McCabe's keen and active intelligence, opulent scholarship, and experience in the things whereof he writes, are as much in evidence in the later as in the earlier volume. There is the same portraiture, lively and grim by turns, of a profound theological intelligence against a background of passionate human life; yet, considered as biography, we can but think the Augustine considerably less successful than the Abélard.

Mr. McCabe's purpose is to correct the perverse impression of Augustine's character and temperament, drawn by inefficient hagiographers from the "seductive Confessions," by viewing his career in a full setting of the various life of his age, and by softening the sharp contrasts of Augustine's edifying self-revelation by a humane

discretion and a temperate and enlightened psychology. There can be no doubt that when Augustine, Bishop of Hippo, took Augustine the rhetorician and "seller of words to boys" as an "awful example" of the unregenerate state, he saw the man that once he was through too many years of dogmatic controversy to see him clearly or see him whole. Mr. McCabe's analysis of the case is worth quoting:

"The fallacy of it all for us, reducing its value as a human document, is that Augustine examines his earlier life from a false point of view. We know how remote his earlier conduct was from the lofty ideal of his later years; but the real moral drama lies in its relation to his pre-Christian conscience. Thus the very attitude of the later ideal spoils the psychological interest of the Confessions. The penitent is face to face with God throughout, striving to maintain throughout the Divine point of view. Fortunately, he drops from the heavens occasionally, and mingles shrewd reflections, subtle speculations, and warm human discourse with his narrative. They it is that have secured for the Confessions not merely immortality, but immortal interest."

Avoiding all categorical extremes, Mr. McCabe contrives to suggest on the lower levels a tolerably consistent and convincing personality. He takes Augustine to have been a clever but none too industrious boy, fond of shows and profane companions, never possessed by the ideal of continence, yet never the vicious and turbulent young fellow that the hagiographers, following the Confessions, have painted him. Indeed, after describing the corruption of the times in quite sufficient detail, our author concludes with the conviction that, young pagan though he was, Augustine was "comparatively a quiet and respectable youth." From this beginning Mr. McCabe proceeds by easy and natural stages to trace a steady mental growth and slow *intellectual* conversion, culminating in a life of moderate asceticism and great and diverse literary and ecclesiastical activity. We have the external man vividly protrayed—short, slight, nervous, ailing, intensely sympathetic; we have a remarkably learned and vivacious account of a complex and decadent society, torn by heresy and schism, sapped by disgust and secret loathing; and we have a final impression of "a great mind, more subtle than powerful, seeking judgment and expression in circumstances of exceptional hindrance."

All this is eminently readable and enlightened, yet the book as a whole, with all its humanism, its self-avowed "tincture of Pelagianism," fails on the higher levels to make Saint Augustine seem a living personality. The truth is that the author has been the reverse of sympathetic with the vital, unifying principle of Augustine's nature—his mystical, Platonic piety. The emotion of piety in all its degrees, from simple trustfulness to rapturous "quotation of God," is a fact of consciousness of the first moment; it may be minimized in men of the type of Abélard, but it cannot safely be neglected in such a man as the author of the 'Confessions' and the 'City of God.' Mr. McCabe never goes to the depreciatory extreme of Gibbon, but there are certain expressions and passages in the Confessions which might with advantage have had a more emphatic notice in his pages; such sentences as, "When I turned from the one I melted away into the many," or that chapter telling "How in the Platonic books he found the divinity of the Eternal Word, but not the humility of the Incarnate Word," reveal more of the real nature of the man than the most elaborate account of his dealings with the Manichees or with the Donatists. In short, while the book is an excellent rationalistic treatment of a notably interesting episode in ecclesiastical history, it fails as a biography through the author's lack of sympathy with the ideal fervors of his subject's temperament. Hence comes the lack of unity of character in the portrayal, which is better than a false and specious simplicity, but which is, nevertheless, a grave defect in the story of a man's life.

I Segni Rivelatori della Personalità, da Paola Lombroso. Turin: Fratelli Bocca. 1902. Pp. vii., 235.

Books of a popular sort on the "science" of physiognomy are nearly all worthless or misleading. Human personality, however, is becoming more and more attractive to the evolutionist, and the time is not so remote when we shall possess a treatment of the phenomena involved at once adequate and intelligible. In this little volume, the daughter of the famous Italian criminologist treats in pleasing fashion a topic for the consideration of which woman would seem to have been well qualified by nature, since the unanimous verdict of all ages and peoples credits her with a remarkable capacity for making rapid judgments of persons and their immediate accessories and environments—a view which scientific investigation has amply confirmed as an evolutional characteristic of the sex. After a brief historical introduction and a chapter on the relations between emotion and physiognomic expression, the author discusses the eye, the mouth, and the other features of face and head, and devotes the remaining half of the book to gesture, graphology, language, profession, and toilet. Looking upon calligraphy as "crystallized gesture," she sees a closer correlation between it and personality than most men of science, with the reviewer, are willing to admit. The character-sketches of the soldier, the magistrate, the teacher, the newspaper man, and the banker, in the chapter on "Profession," are well done. The monotony of the life of the teacher and the varied experience of the journalist are interestingly contrasted. In the section on language one does not find the story of the traveller who discovered the professions of his companions from their answers to the question, "What is it that devours its own offspring?" That tale gives in a nutshell the contents of the chapter. The discussion of gesture is good, but too short. The gesture *ensemble* of an individual, the author observes, gives us a sort of psychic shadow of his internal nature which may be compared to the physical one given by the silhouette on the wall.

The illustrations to the chapters on physiognomy are of modern and chiefly of living persons, the frank treatment of whose personalities adds not a little to the general interest of the book. The comparative study (pages 43-47) of Nansen and Garibaldi is suggestive; the one representing the disciplined energy of the man of science, the other the prodigal energy of the poet in the broad sense of the term. The brief sketch of Enrico Ferri, Socialist leader and Deputy, orator and scientist (pages 54-56), is a tribute to Italian optimism. The eye of Max Nordau and the mouth of the famous actress Duse seem to have impressed the author, the latter unfavorably; so, too, the mouth of Mascagni, the composer, the very short characterization of whom would have been cordially welcomed by our newspaper paragraphers a few months ago. The higher type of the "new woman" may be seen in Miss Kulitchoff (page 37). A fine appreciation of Mrs. Browning is given on page 65. One can scarcely err in recommending this little volume as the best of its kind perhaps in any language for popular reading. It is at the same time scientific enough not to be very dangerous. It merits an English dress.

Index Britanniae Scriptorum: John Bale's Index of British and Other Writers. Edited by Reginald Lane Poole, with the help of Mary Bateson. Oxford: Clarendon Press; New York: Henry Frowde. 1902.

Bishop Bale's two bibliographical works, the 'Summarium' (1548), and the more elaborate 'Scriptorum Illustrium Maioris Brytanniae Catalogus' (1557-59), are well-known to all investigators of early English literature; and it is hard to say whether they are more valued for the curious information they contain, or execrated for their heedless repetition of unsupported conjectures. Particularly troublesome is the task of determining whether the compiler, in a particular case, was following good authority or whether he was, as one is sometimes tempted to suspect, concealing a defect in his knowledge by means of rhetorical generalities. It is therefore particularly agreeable to have a complete edition of his autograph note-book. This valuable document, preserved among Archbishop Selden's manuscripts in the Bodleian Library, almost always records the exact source from which Bale derived his information, and, since it was prepared for his own use, it is practically free from imaginative embellishment. It is a very extensive collection of raw materials for literary history, made "at a date when materials were accessible which in a few years more were scattered and largely lost." Henceforth no student can think of referring to the bishop's printed catalogues without comparing the information they profess to give with the memoranda now made accessible by the industry of Mr. Lane Poole and Miss Bateson.

The editors have very properly directed their attention in the first instance to the careful reproduction of the manuscript and the arrangement of its contents in an order that should make them easy to use. Annotation, however, was also a part of their plan, and their commentary shows hard work and a good deal of learning. Still, at the risk of seeming ungrateful, we must add that it leaves much to be desired. Completeness was, of course, unattainable, but one cannot turn over the leaves of the volume without observing a great many places where useful information might have been supplied, or errors in the catalogue corrected, with slight additional labor. It is a pity, too, that the elaborate indexes do not fully cover the appended matter (pp. 467-

518), which is particularly difficult to consult.

An example will make it clear how unfortunate this omission is. Many persons suppose that there is a tradition that Sir Thomas Malory, the author of the 'Morte Darthur,' was a Welshman. When the "tradition" is tested, however, it is found to go back to Bale's 'Catalogus,' and when the statements of that work are scrutinized, they appear to rest on a mistaken interpretation of Leland's language and on the fancy of the writer. It therefore becomes of some moment to ascertain what evidence Bale's own note-book affords on this question. Now the name of Malory is not entered in the index, and is, indeed, not contained in the body of the work as here arranged. It may be found, however, in the fourth appendix (p. 499) in a list of names "ex quodam opusculo Ioannis Lelandi"; and in the second appendix (p. 482), there is an entry of much interest relating to the 'Morte Darthur,' provided for in the index under *Vita Arthuri* only. This second appendix, it should be noted, is an integral part of Bale's work; it consists of entries which "bear no indication of authorship," and which are now removed from the body of the text in the process of editorial arrangement.

RECENT AND SHORTLY FORTHCOMING EDUCATIONAL WORKS

in Science, Mathematics and Finance

Hertwig's Manual of Zoölogy. Translated from the Fifth German edition by Prof. J. S. KINGSLEY of Tufts College. 704 pp. 8vo, $3.00 *net*.

[Part First of this work translated by Prof. G. M. Field, under the title *General Principles of Zoölogy*. $1.60.]

Prof E. B. WILSON, *Columbia University*: "The usefulness of Hertwig's book has long been recognized and Prof. Kingsley has introduced many improvements that will commend themselves to American zoölogists. It is not improbable that I shall conclude to adopt this work as a text-book."

Vernon's Variations in Animals and Plants 415 pp. 12mo, $1.75 *net*. (Postage 13c.)

A treatise on biological variations and their relation to Darwinism, which, though scientifically accurate, will appeal to others than specialists.

Wilder's Synopsis of Animal Classification By Prof. HARRIS H. WILDER, of Smith College. 57 pp. 8vo. 60c. *net*.

Peirce's Plant Physiology By Prof. GEORGE J. PEIRCE of Stanford University. 297 pp. 8vo. [*May* 1.]

A modern and thoroughly scientific discussion of the general principles of plant physiology, intended for the student or general reader acquainted with the elements of botany.

Kerner and Oliver's Natural History of Plants

With over 2,000 original wood-cut illustrations. Cheaper edition, 2 Vols., 8vo, $11.00, *net*.

Cohen's Physical Chemistry FOR PHYSICIANS AND BIOLOGISTS. Translated by Dr. MARTIN H. FISCHER. 331 pp., 12mo. $1.75 *net*.

The first part of this book discusses the principles of physical chemistry that have recently assumed such great importance in medicine and biology, while the second half applies them in physiology, pathology and pharmacology.

Noyes's (W.A.) Organic Chemistry By Prof. WM. A. NOYES of the Rose Polytechnic Institute. 552 pp. 12mo. [*April*.]

The author's most radical departure in method consists in the dropping of the division into 'fatty" and "aromatic" compounds and in the adoption of what appears to the author a more fundamental and logical classification.

Noyes's (A.A.) General Principles of Physical Science

An Introduction to the Study of the Principles of Chemistry. By Professor A. A. NOYES of the Mass. Institute of Technology. 160 pp. 8vo, $1.50 *net*.

Discusses those fundamental principles of physics and chemistry, a knowledge of which is essential as a basis for a thorough study of modern "Physical Chemistry."

Echols' Differential and Integral Calculus AN ELEMENTARY TEXT-BOOK. By Prof. WILLIAM H. ECHOLS, of the University of Virginia. x+480 pp. 8vo, $2.00 *net*.

Prof. Alfred Baker of the University of Toronto: "I find it an admirable text-book. The printing is good, the explanations clear and concise and the examples numerous, illustrative and full of suggestiveness."

Scott's Money and Banking By Prof. WM. A. SCOTT of the University of Wisconsin. 381 pp. 8vo, $2.00 *net*.

A plain, straightforward account of the nature and functions not only of money in the stricter sense but also of the other mediums of exchange.

Prof. *H. E. Mills*, of Vassar:—"It is clear, comprehensive and conservative. All in all, it seems to me the best single book to use in connection with a course on Money and Banking."

NEW BOOKS WORTH NOTING

PUBLISHED THIS WEEK

By JAMES BRYCE, *Author of "The American Commonwealth."*

Studies in Contemporary Biography

Twenty sketches of eminent men of the 19th century, with all but one of whom the author had a personal, and in most cases an intimate, acquaintance. They treat of, among others, Lord Beaconsfield, J. H. Green, E. A. Freeman, C. S. Parnell, Cardinal Manning, E. L. Godkin, and Wm. E. Gladstone. *Cloth, 8vo, $3.00 net*
(Postage 17c.)

A New Volume in the
AMERICAN SPORTSMAN'S LIBRARY

The Water-Fowl Family

By L. C. SANFORD, L. B. BISHOP and T. S. VAN DYKE. Illustrated by A. B. Frost, L. A. Fuertes and C. L. Bull. Uniform with "The Deer Family," by Theodore Roosevelt, etc.
Cloth, gilt, 12mo, $2.00 net
(Postage, 15c.)

JUST READY

The 40th Official Publication of

The Statesman's Year-Book, 1903

Contains especially valuable new matter in the Bertillon tables, showing the comparative growth of population in different countries during several decades, in the sections on the incorporation of the two South African Republics in the British Empire, etc. It is conceded to be the one indispensable statistical annual. *Red Cloth, 12mo, $3.00 net*
(Postage 19c.)

By WIRT GERRARE, *Author of "The Story of Moscow"*

Greater Russia:

The Continental Empire of The Old World

"Mr. GERRARE'S work not only supplies the great need of foreigners, 'trustworthy information from non-Russian sources,' but recounts it delightfully for our enjoyment."—*Courier-Journal.*
Cloth, 8vo, $3.00 net
(Postage 22c.)

By DAVID MILLER DeWITT

The Impeachment and Trial of Andrew Johnson, Seventeenth President of the United States A HISTORY

A full and entertainingly written account of a most interesting, exciting, and, from the standpoint of the Constitution, important episode in this country's history. *Cloth, 8vo, 646 pp. $3.00 net*
(Postage 22c.)

The Nation.

NEW YORK, THURSDAY, APRIL 23, 1903.

The Week.

It was incumbent on the Attorney-General to oppose the motion of the Northern Securities Company for a modification of the decree in the merger case. Duty to one's client is the same when the client is the United States as in the case of an individual. The Attorney-General's contention was that the Northern Securities Company is illegal, and hence that all its acts are void. If an illegal company can collect dividends now, may it not postpone its argument on appeal to the Supreme Court and continue its illegal existence indefinitely? The court, in granting the modification sought, has met this point by requiring that the appeal shall be prosecuted with due diligence and effect, of which the court will itself be the judge. It does not follow that because one dividend from the underlying corporations may be collected, subsequent ones may be collected also. Nor is there any reason to suppose that the counsel of the Northern Securities Company will delay the prosecution of their appeal or come short of the due diligence which the court enjoins. Under these circumstances, it would be a needless embarrassment to withhold from the company the money earned and already due to its shareholders, which money would reach the same shareholders eventually in any event. If the original order of the court were not modified, the probable course of procedure would be the purchase of the dividends by the banks in which the money is now deposited, and a charge of interest for the intervening time. The modifying order wisely avoids this needless labor and expense.

"The people want and ought to have the report made by Gen. Miles concerning conditions in the Philippines." This is the opinion of the Indianapolis *News*, which properly resents the attitude of the Washington Administration towards this and other documents which are unfavorable to our Philippine policy. Apparently, Secretary Root regards the public as if it were a small and helpless child, to be fed only on selected literature—selected by him, of course. If privately asked, we have no doubt that the Secretary would say that Gen. Miles's report misrepresented facts, and therefore ought to be suppressed. If that is so, the public may be relied upon to discriminate, and there will quickly be proof enough of the General's errors to correct his misstatements. But that is evidently not to be Secretary Root's way of doing things. Apparently, if he lets the report out at all, he is going to let it out piecemeal, and attach to each piece the opinions of officers or of governors who oppose Gen. Miles's views. This has actually been done in regard to the General's recommendations about the proper food supply for troops in the archipelago, and about the wisdom of employing troops to build roads. "Apparently, in anticipation of this criticism," says the Washington *Star*, "there is extant the opposite view of Gen. Davis, commander-in-chief in the Philippines, and this is published with the Gen. Miles recommendation. Similarly, the Subsistence officers are allowed to say why they disagree with the Lieutenant-General." But nothing has yet been heard of that portion of Gen. Miles's report which deals with the Howze cruelties and other horrors perpetrated by offenders in uniform.

A Washington dispatch states that President Roosevelt has communicated to his Cabinet officers his intention not to allow any more "barbaric yawps" from their subordinates against Germany to go unpunished. The authenticity of this report is not vouched for, but the subordinates aforesaid should consider it well founded, and control their tongues accordingly. The truth is that certain army and navy officers are usurping the functions of the yellow press in creating sensations in order to cause themselves to be talked about. As a general rule, these garrulous individuals are not seeking to provoke war or to get the country into trouble, but merely to draw public attention to themselves. They do not weigh their words. Their words are not worth weighing generally, but they irritate foreign governments and bring humiliation upon their own. If there has been a sore spot in the past in our relations with Germany, or only an unfounded suspicion of one, they seem to regard it as a proper subject for mirth or for maladroit observation like that to which Admiral Dewey recently gave vent. President Roosevelt ought to do something more than have a private talk with the next officer who commits such an indiscretion. The higher the rank of the offender the more public his rebuke should be.

The Philadelphia *Ledger* prints the facts regarding the appointment of negroes to office by President McKinley. It appears from its list that he put no less than fifty-two into the Federal service, to say nothing of several hundred appointed to the regular and volunteer armies. Nine of Mr. McKinley's appointees were made collectors of customs, sixteen were given post-offices, five went to the internal-revenue service, and nine into the Interior Department. To the diplomatic and consular service Mr. McKinley appointed the following: Rev. O. L. W. Smith, Minister to Liberia; W. S. Howell, Minister to Hayti; John T. Williams, Consul at Sierra Leone; Dr. L. W. Livingston, Cape Haytien; M. W. Gibbs, Tamatave; M. B. Van Horn, St. Thomas; Dr. George H. Jackson, La Rochelle; C. L. Maxwell, Santo Domingo; J. R. Ruffin, Asuncion; R. T. Greener, Vladivostock; Dr. H. W. Furness, Bahia; J. R. Spurgeon, Secretary of Legation at Liberia; T. J. Calloway, special agent Paris Exposition. Beside this list, Mr. Roosevelt's fifteen negro selections seem few indeed, particularly as eight of the fifteen were reappointments. Naturally, the *Ledger* asks why "the South, which is so angry and clamorous regarding President Roosevelt's original seven appointments, was neither indignant nor clamorous with respect to President McKinley's fifty-two appointments." But the good McKinley never asked Booker Washington to dine with him *en famille*.

The convention of the National Association of Manufacturers opened with a report by its President, in which organized labor received very severe treatment. The subject of discussion was the bills before Congress at the last session known as the eight-hour and the anti-injunction bills. These ought, the report says, to have been entitled "an act to repeal the bill of rights guaranteeing the freedom of the individual" and "an act to legalize strikes and boycotts." Upon this thesis a long and able review of the encroachments and demands, the tyranny and crimes, or trade unions was given, and we cannot say that the arraignment was too severe. The drift and tendency of all these demands and the lawless methods of enforcing them, the report says, are in the direction of socialism. Perhaps so; but are the trade unions the only organizations promoting socialism? The contention of the Socialists is that the State should take possession of the natural resources of the country, the tools of production, and the avenues of transportation, and find employment for men and distribute the joint product of labor and capital in an equitable manner. This would be doing on a large scale and in open manner what is now done on a smaller scale and in a somewhat less obvious way by the protective tariff. The Dingley theory now prevailing is that if the manufacturers are protected against foreign competition, they will be enabled to pay high wages and will avail themselves of that opportunity on equitable terms. This is the essence of socialism. Dingleyism says: "Deliver

me from the fear of competition, give me the privilege of fixing the prices for my own products, and I will divide fairly and squarely with my workpeople." The laborers assent to the plan. It falls in with their notion of State interference with industry, but they do not believe that there has been a square divide of the joint product. Hence strikes, boycotts, picketing, and many kinds of tyranny and outrage which are so aptly described in the New Orleans report. Of course, these latter conditions might exist under free trade. They are met with in England as well as here, but in England the example of State socialism has not been set by the employers to the wageworkers.

Apparently the incongruity of their attitude in this particular has been forced upon the attention of the Association, for we find among the resolutions reported for consideration one "urging tariff revision on general lines." This is in harmony with the action taken by the same organization at its Detroit meeting last year. Although the Republican party appears to be deaf to every suggestion of tariff revision, it is impossible that the country can continue for any long time to witness the spectacle of American goods selling in foreign markets at lower prices than in the home market. This scheme, the last refuge and device of the tariff-protected Trusts, is attracting more and more attention both at home and abroad. It is the application on a wide scale and in a more brazen way of the sugar-bounty system which has so often excited us, and which led to the misunderstanding with Russia, and to the retaliatory duties which she imposed two years ago upon many of our exports. If producers can be protected against foreign competition in the home market, they can sell their products to domestic consumers at the limit fixed by the tariff, and undersell the foreigner in his own market by means of the bounty which the law enables them to collect at home. This has often been done, and is done in certain lines of trade every day in the year. Socialism never conceived of anything more wanton or more at variance with the principles of justice.

In his consuming desire to help Mr. Roosevelt get delegates, Senator Hanna is going to make a public defence of labor unions against the attacks of the Manufacturers' Association. He is to speak particularly to the charge that they countenance and profit by violence. They are sorely misjudged in that matter, he complains. An occasional member gets out of hand, he admits, and does some clubbing or murdering; but why hold organized labor responsible for that? A village may contain one or two blacklegs, but you do not say that they determine the character of the whole community. Well, we are not sure that we should not be bound to say so if the community quietly encouraged the blacklegs, and divided the swag with them. We should like to put one simple case to Senator Hanna, however, and ask him to explain it. The so-called anti-injunction bill in the last Congress was intended to aid labor unions. It forbade the use of injunctions to restrain acts by several which would not be criminal in an individual. But an amendment was adopted in the Senate committee, providing, by way of abundant caution, that exception should still be made of acts involving danger to property or life. Now is it not a fact—Mr. Hanna knows—that labor leaders wrote privately to Senators protesting that this amendment would destroy the whole value of the bill? In other words, they desire to be free to employ violence, and do not wish to be enjoined therefrom. The Ohio Senator should not pass over this point in his address on "Labor Unions: What I Have Done for Them, and What I Hope They Will Do for Me."

Lieut.-Gov. Lee of Missouri, who has apparently fled the State, from unwillingness to appear before the grand jury in the legislative bribery inquiry, is reported to have declared that Circuit Attorney Folk "is always making an ass of himself." This doubtless was also the opinion of sundry members of the House of Delegates in St. Louis, who suddenly went to Mexico and elsewhere for their health when Mr. Folk began his exposure of official corruption in that city. The legislative bribery investigation is now at the stage reached by the local boodle inquiry when Philip Stock and Charles H. Turner first furnished the Circuit Attorney with information by means of which he was able to force confession after confession, and to land many of the bribers as well as of the bribed in the penitentiary. Just what information Mr. Folk already possesses is not yet known, but it is certain that the entering wedge has been driven. The work of the grand jury and of Mr. Folk will now be, as in the House of Delegates cases, to piece together the details which have been secured, and thus to complete the story of the formation of the legislative ring, and the means adopted to attain its corrupt ends. When this is done, if the Circuit Attorney follows his former method, exposures will come thick and fast.

In the Citizens' Union convention on Thursday night the popular chord was struck when references were made to honesty and fair dealing. This was a tribute not only to the Administration of Mayor Low, but also to the Citizens' Union itself in its advocacy of principles and candidates. The spectacle of a political convention praising the administration of an official of its own choosing, and at the same time adding an important qualification to its endorsement, is a rarity, but it is none the less refreshing on that account. The resolutions themselves were drafted in admirable temper, and were adopted without amendment or dissent. Conventional hyperbole and traces of the whitewash brush were missing, but no doubt remains that the rank and file of the Citizens' Union, as represented in the convention, are as ready to carry on the fight for good municipal government as they were to begin it. It was freely stated by many speakers that the Citizens' Union has become a municipal party. This appears to be the fact. The old idea that non-partisans in municipal affairs must not organize to carry out their programmes of betterment has disappeared, at least so far as the Citizens' Union is concerned. The Union now possesses practically all the machinery of a party with, as Mr. Cutting says, one exception—the boss. It has local organizations in the Assembly districts, some of them exceedingly active. Moreover, in its convention, while the right of free and open speech was amply preserved and exercised, there were evidences of a new understanding of the necessity of coordinate action based on a coherent plan. Two years ago the spring convention adopted a platform which, so far as it could be understood by anybody, called for half a dozen wild performances in the name of "progress." That platform, to be sure, was forgotten a week after its adoption, and did not seriously hamper the Union or the Union's candidate in the election canvass. But, fortunately, this course has not been repeated. The resolutions which the convention adopted referred to the subject in hand, and the matter of drafting a platform was turned over to a committee to report in the fall. The wonderful growth and vitality of the Union prove that an organization dealing with political affairs can be held together by another and stronger influence than "the cohesive power of public plunder." Its new sagacity and temperateness of tone show that it is learning by experience.

The actual withdrawal of one large trust company from Clearing House affiliations, because of that institution's requirement of cash reserves, and the reported purpose of two or three others to withdraw, are a matter for regret. We so regard it, despite the facts that the reasons are not hard to understand, and that the present situation will scarcely be altered by the action. The rule adopted just a year ago covered only future applicants for Clearing House privileges; but it was distinctly suggested that trust companies already using the Clearing House ought, in view of the greatly expanded credit situation, to adopt such a policy, and the Pres-

ident of the Clearing House intimated that the requirement might, later on, be thus extended. After ten months, on the 11th of last February, the trust companies having made no sign, this further action was taken, by a unanimous vote. The position of the trust companies appears to be, that they will not submit to dictation at the hands of the Clearing House. Rather than regulate their business on lines prescribed by that organization, they intimate that they will forego its privileges. If they do, their future policy as regards their own reserves will impose on them a grave responsibility. The one institution, which has already formally withdrawn, occupies in this regard an exceptional position. It carried, last year, one-fifth of the entire cash on hand reported by the seventy-seven trust companies of New York State; the reserve thus carried by it being $2,021,607. By its own example, therefore, the Union Trust Company recognizes the wisdom of cash reserves for its fellow-institutions. The question what policy other withdrawing companies will, in this regard, adopt, must therefore excite deep interest. The other point to which we must call attention is the attitude of the Legislature. It is pretty well known that, but for belief at Albany that the Clearing House rule would be made effective, the pending Smith bill, placing the trust companies under the 15 per cent. reserve requirements of the State banks, would in some form have been adopted. Its adoption, on the eve of this session's adjournment, is out of the question. There is some interest, however, in the query, What will be done at Albany next winter, if the Clearing House's experiment turns out fruitless?

The packing system generally adopted by our street and elevated railways has received something like judicial sanction through a decision of Justice McCall of the Supreme Court. The case was that of a passenger who, finding all cars of an elevated train full, except a rear car, which was to be switched off, took his seat in the empty car and, refusing to leave it at the switching station, was put out forcibly by the guard. It should be noted that the train started full with a prospect of greater crowding all the way down town. Under the circumstances, the recalcitrant passenger had a strong case in common sense when he opposed the dropping off of an empty car. The judge could have decided against him only on the ground that such a change of plan as the attachment of an extra car to that particular train would have worked confusion in the general running schedule. It is to be hoped that the decision was based closely upon the specific case, for a general assertion of the principle that the train schedule of the elevated roads is immutable, and that these railroads need not make particular arrangements to meet the changing needs of traffic, would make the transit outlook gloomy enough. One of Josiah Flynt's characters observes that "the law's not for the Irish." Many New Yorkers will have about this feeling when they see what may fairly be called "crush law" sustained by the courts.

Whether Great Britain's public credit does or does not, at this moment, surpass that of any other nation, may be a question for discussion; but the question will not be settled by a comparison of prices for England's public securities and ours. The *World* combats, on this ground, the assertion of the *Evening Post's* London correspondent, that "England's credit still stands much above that of any other country"; pointing out that while 2½ per cent. British consols sell now at 91 5-16, United States 2 per cent. bonds are 106¼ bid. Two facts combine, however, to vitiate this comparison. One is, that the interest on our Government bonds is free of tax, as against a present tax of more than 6 per cent. on the income from British consols. The other is, that, out of our $914,500,000 Government bonds outstanding April 1, $495,500,000 were in the hands of banks which had to hold them as a means of retaining their note circulation and public deposits. In this respect, the situation here is much what it was with British consols during 1897, when trustee and savings-bank surplus funds were virtually driven into consols. Since the Colonial Stock Act of 1900—one of Mr. Chamberlain's steps to appease England's dependencies—admitted about $1,000,000,000 new securities to the field of trustee investment, consols have lost their peculiar leverage. United States bonds would have partly lost it if the Aldrich bill, greatly widening the scope of collateral required for Government bank deposits, had become a law. But, in any case, one season's price of Government bonds is a very inadequate measure of relative public credit. If the United States Government had issued eight or nine hundred millions of new bonds within three years, on a depressed investment market, our own present prices could scarcely have been maintained. Yet we could not fairly say that our credit had declined.

Though Mr. Wyndham's Land Purchase bill has been enthusiastically endorsed, as to principle, by the convention of Irish Nationalists at Dublin, the impression is left that much might have been said in opposition had it seemed expedient. Very significantly, the convention, instead of proposing amendments of its own, agreed to leave all such matters to the Irish members of Parliament under Mr. John Redmond. This was a tacit assumption that the Nationalists at Westminster hold the whip hand and can shape the bill in committee after their own mind. It was at once an expression of confidence in Mr. Redmond, and an assertion of the political fact that Mr. Balfour is in the hands of his Irish friends. The favoring voice of the Nationalist convention makes the passage of the bill almost a certainty, for the Liberals cannot oppose it in principle, and Mr. Balfour is too thoroughly committed to the measure to postpone it or dissolve Parliament before a vote is reached. Only an accidental defeat can prevent this result. But Mr. Michael Davitt's contemptuous reference to resident landlordism—a main point in the recommendations of the Land Conference—increasing criticism of the financial features of the bill, and constant mutterings of the old Home Rule propaganda formally reaffirmed by the Dublin convention, indicate that even when the Irish have got the Land Purchase bill they will be certain to ask Mr. Balfour, or a successor, What next?

To an already complicated Ministerial situation in England the new London Education Bill can hardly be helpful. In the comprehensive law of last year London was excepted. There the board schools are most firmly entrenched. The London School Board, an elective body, had on its roll for the year ending March 26, 1902, 546,370 pupils and 11,235 teachers, as against 210,000 pupils in "voluntary" schools (private schools receiving a Government grant). Since 1872 the School Board has done this work of education admirably, and it was supposed that Mr. Balfour's Government would hesitate long before abolishing so efficient a body. Sir William Anson's Education Bill for London, however, is drastic enough. Nothing is to be left of the old School Board except an honorary representation of five in a committee of ninety-seven. Financial control is vested in a committee made up of thirty-six representatives of the London County Council, thirty-one delegates from the Borough Councils of the city of London, twenty-five women, delegates of voluntary schools, etc., and five members of the present School Board. It is an absurdly large commission, and unwieldy also in its constitution. The actual management of the schools (excluding finance) is given to the present Borough Councils, which Mr. John Burns, the Socialist member, describes as "a panjandrum of superior persons." They certainly have no experience in educational matters. The bill has the look of a stupid and complicated measure, even upon the Government's theory that the School Board must go. The logic of the situation was to give complete financial control to the County Council, and allow it to delegate management to committees. But the framers of the bill had political and ecclesiastical reasons for exalting the London boroughs.

THE SOUTH AND THE EDUCATED NEGRO.

At the large and enthusiastic meeting held in this city last week in the interest of negro education in general and the Tuskegee Institute in particular, a note of genuine sympathy for the South was heard in every speech, from Mr. Cleveland's to Mr. Washington's. It is a fine and just sentiment. The South's problem is our problem. We are all one. The head cannot say to the foot, "I have no need of thee." Negro education and uplifting is a national task—nay, in this age, when the ends of the earth are bound together, it is an international task. The South is simply the scene; the actors in the great drama should know no section nor ancient prejudice.

We unfeignedly share in this feeling of common responsibility. The North is in no position to judge the South censoriously. Here, as there, the searching questions need to be put: What are we going to do with the negro after he is educated? Are we to bar him from the occupations for which he is struggling to fit himself? Are we to neglect his political education? Shall we encourage him to become a property owner and a taxpayer, while telling him that the one sure defence of the taxpayer—the suffrage—is not for him? Official returns show that millions of dollars' worth of property is owned in Virginia by colored men. Yet they are injuriously and perhaps illegally disfranchised; and when the Union League Club is asked to look into the matter and take a test case to the United States courts, it lays the resolutions on the table. When the leaders of the race, men of education, character, and ability, are singled out for political honors, shall we be found crying out—or whispering shame-facedly—that such a recognition of the educated negro is a blow to negro education? For the present, we are content to test the whole matter, North and South, by the attitude which is assumed toward the educated colored man. It is not a thing to be left to the future. Black men at the top are already with us. How are we to treat them?

Now we understand perfectly the unreasoning feeling—race instinct, is the exculpatory name for it—which leads people in the South to dread the rise of the negro. It is a complex sentiment. There is in it, first, a shrinking from what is called "social equality," and, second, a vivid memory of the excesses and crimes of government in the South during reconstruction. But precisely from the educated negro has the South least of all to fear in either of those particulars. What complaints are ever heard of colored physicians or clergymen pushing themselves into white society where they are not wanted? In the city of Nashville, the leading dentist is a negro. He has the patronage of the best white people, yet none of them have ever thought there was a peril of "social equality" in his case. Education makes men gentlemen, and a gentleman does not thrust himself into circles where his presence is offensive. Similarly on the political side; the reason why the negro vote supported carpet-bag domination in the South was that it was an ignorant vote. Could Dr. Crum of Charleston, could the graduates of Hampton and Tuskegee and Fisk and Atlanta, be thought capable of advocating a policy of spoliation and terrorism such as affrighted the South in the reconstruction period? Yet it is exactly against these educated negroes that feeling in the South is now running highest.

That is why we maintain that the political rights of the negro are inseparably bound up with the cause of his education. It is not Northern prejudice, but Southern intolerance, which is forcing that issue to the front. Some say that the South will take kindly to the negro after we have made him worthy of citizenship. But it is the very colored men most worthy whom the Southern press and Southern Congressmen most bitterly assail. Educated negroes have been sparingly and cautiously appointed by the President as examples to their race, but what is the response? Read the Charleston *Evening Post*. "Let us remove the negro," it says. It frankly admits that "the attitude of the Southern white man towards the negro is incompatible with the fundamental ideals of the republic," but it adds that, until the colored population is expatriated or exterminated, "we will subordinate the negro and not worry about the fundamental forms of government." We do not accuse this Southern newspaper of being recreant to democratic principles above all that dwell in the North. It is simply a little more outspoken than many Northern men who think as it does. Senator Tillman said, most significantly, in his speech in Charleston a few days ago, that he could have obtained the rejection of Dr. Crum's nomination "in a secret session of the Senate." "Senators have denounced it privately, but they are afraid to vote against it." There is, undoubtedly, timidity and truckling at the North as well as intolerance at the South. But both will be made ashamed, or swept away, if the clear issue of human rights, with the guarantee of the Constitution, is pressed as it should be.

THE NAVAL FOLLY.

A distinguished naval officer writes to us: "One of the signs of the times is the transfer of the struggle for armed superiority from the land to the sea. In this transfer we have become entangled —largely through our holding on to the Philippines, which makes us guilty of the strategic blunder of maintaining an outpost many thousands of miles from our base." He asks us to comment upon this surprising change in policy which results in "substituting Jack Tar for Tommy Atkins on the peasant's back."

The theme is inviting. Take the matter of expense. All public expense means, by so much, personal deprivation. Income to the Government means outgo to the citizen. We have frequently remarked on the swollen and swelling naval appropriations of Great Britain, France, and Germany. The huge estimates for new ships and their maintenance are presented to Commons, Chamber, or Reichstag with an apologetic air. But how stands our own account? We are pushing up our annual expenditure on the navy at a portentous rate. Twenty years ago the naval appropriation bill carried less than $15,000,000. Even as late as 1895 it had reached only about $25,000,000. But the bill for the current year appropriated no less than $80,000,000. That is to say, the naval tax has mounted from about 45 cents per capita in 1892 to $1 in 1903—a cornerstone fact for the McKinley monument. Moreover, the expense is bound to go on by cumulative additions. One hand washes the other, and for both the country has to pay. A programme of navy enlargement to the tune of $20,000,000, as provided this year, compels enlarged appropriations for equipment and support. New ships require new men; 3,000 more seamen are to be enlisted, under the terms of the last naval appropriation bill, with 550 men added to the Marine Corps, and the number of midshipmen in the Naval Academy doubled. All told, we are at the present time clearly on a road which will speedily lead us to a naval establishment that will demand an outlay of $150,000,000 annually.

Thus rapidly are we wiping out, of our own motion, the advantage which we have always boasted that we had over European nations. Our isolation, with our expanding population, freed us from the necessity of going armed to the teeth. How, we have asked triumphantly, could the John or Hans or Jacques of the Old World hope to compete with the free labor of American farmers and artisans, so long as the former had to go to their work in the field or shop each with a soldier strapped upon his back? Well, we are strapping on a sailor instead. Do not forget that the dread of vast military establishments which Americans have proverbially expressed has had to do primarily with their costliness. This was what Mr. Roosevelt had in mind when he wrote, seven years ago, "We do not wish to bring ourselves to a position where we shall have to emulate the European system of enormous armies." This was also what he had in mind the other day when, as President, he congratulated the people of the West on the fact that the army, and the expense of it, were being substantially cut down. It is not that he

or anybody fears that a great standing army will destroy our liberties; only that it will eat up our resources. But what shall it profit us to save $5,000,000 on the army if we promptly waste it and $20,000,000 more on the navy? Of all money unproductively locked up, that put into battleships not absolutely needed is the most profligately squandered.

And, as our naval correspondent points out so sagaciously, we are going into this game of naval strategy with an immense strategic blunder at the start. The theory is that we must prepare to defend ourselves by a navy against the possible aggressions of foreign nations. All the millions asked are for defence. No advocate of a big navy for the United States says openly that we dream of attacking anybody. All the talk is simply of making ourselves so strong that no one will dare to assail us. And yet in this process of making ourselves strong, we begin by making ourselves weak strategically, and laying ourselves open to an attack which we have no means of resisting! Who can doubt that, if war were to break out tomorrow between this country and England or France or Russia or Japan, the Philippines would fall to the enemy at the first blow? Their retention is a source of peril to us, in a military sense, just as it was to Spain. Where, on our professed principles of strategy, we should have been drawing ourselves in to become impregnable, we have been spreading ourselves out with the result of becoming highly vulnerable.

Oh, but nobody is going to challenge us in the Philippines. It is not at all necessary to have a fleet in the Pacific strong enough to meet any combination which might be made against us. We are a peace-loving nation. No Power is going to attack us. But this is to give up the whole case. If we do not need a preponderant navy to defend the Philippines, we certainly do not to defend our own shores. If we are to rely upon our good intentions in the one case, we safely may in the other. The truth is that there is no logical middle ground between a small and efficient navy designed for use in peace, and one big enough to meet all comers in any possible war. We are muddling away at great expense in a futile effort to find something between the two. We are not in a position, and there is no likelihood of our ever being in it, to outclass the great naval armaments of Europe; yet as if that impossible goal were our definite objective, we take needless millions from the labor and thrift of our people, and deliberately assume an unnecessary handicap in the industrial competition now pressing so hard upon all the world.

THE MACHINE BREAK-UP.

Dr. Philip Schaff used to speculate on what would happen if an infallible Pope should declare that he was not infallible. A parallel confusion is offered in the spectacle of a beaten boss asserting that he cannot be beaten. Senator Platt essays, in face of the disastrous collapse of his power at Albany on Thursday, an air of philosophic calm. It is a trifle. He half expected it. It will soon blow over. But all that will not do. His followers know what has happened, if the old boss pretends that he does not. They are filling the air with cries of "a revolt" and "disaster," at the very moment when he is trying to draw out the cold steel which has run him through, and to maintain that he has received only a scratch. His most faithful squires perceive that he has been dealt a mortal hurt, and that, though the sword-thrust is not perhaps as deep as a well or so wide as a church-door, 'twill serve.

The rejection of Platt's man Baker by the Senate is naturally accepted, in the minds of all those who go behind the appearance to the substance, as conclusive proof of the ending of the domination of the old Republican machine in this State. It was a crucial test. If a boss cannot, by the exercise of all his power, deliver an office which he has promised, then his glory has obviously departed. He may blunder in policy, he may flaunt his personal indecency in the eyes of the whole State, he may consort with the small-minded and the disreputable, and still retain his power; but if he cannot put his henchmen actually in office, even they will fall away from him. We desire to judge the drama in an entirely detached and impartial spirit. The actors were, doubtless, not all what they seemed. We have our doubts whether Gov. Odell made heroic efforts to secure the confirmation of the Platt nomination which he himself had sent in. The Platt organ is, as usual, shrieking out charges of treachery against the Governor. On the surface, of course, his action was perfectly regular. He lived up to his agreement to nominate Baker. Possibly he may now express his regret that Senator Platt was not strong enough to pull his man through. But it is evident that the people of the State will not stick in the bark of the affair. They understand perfectly that the break has come between Platt and Odell. The latter was told that he could not prevent the reëlection of Platt to the Senate without exposing himself to the charge of the blackest "ingratitude." Platt or ingratitude was the alternative offered him. He consented to the return of Platt, whom he might and should have defeated, only to find that he was afterwards pursued as an ingrate all the more fiercely. Finally, as we conceive, he grew tired of keeping up the pretence any longer, and quietly beat Platt at his own game.

If any doubt of this remained, it must have been dispelled by the nomination of Mr. Morgan, in place of Superintendent McCullagh, directly on the heels of the rejection of Baker. McCullagh pinned all his hopes on Platt's support. Serviceable to the old boss as he had been, and to the bosslet Quigg, he counted confidently upon their machine to keep him in the office which he had so notoriously prostituted. But Gov. Odell refused to renominate him, and, as if to turn the weapon in the wound, selected in his room a man of high character and fine record, absolutely without political backing. Mr. Morgan at the head of the Bureau of Elections cannot fail to be a vast improvement on the discredited McCullagh. Working hand in hand with Mr. Jerome's detectives, he will be able to prevent flagrant colonization on the East Side, and to head off Tammany collusion, for electoral purposes, with some of the worst Raines-law hotels. Young, active, honest, and able, Assistant District Attorney Morgan is an appointee who reflects credit on Gov. Odell for selecting him. We do not doubt that the Governor was anxious to get a good man, but we presume also that he took a certain pleasure in nominating him to an office now filled by a creature of Platt's.

All told, we cannot but regard the late occurrences at Albany as auspicious. The old machine tyranny is visibly breaking up. A handful of Republican Senators have defied the boss to do his worst, and not merely have survived, but stand to-day triumphant, while he is baffled and broken. Senators Brown and Elsberg were literally within the truth when they said that their course had the enthusiastic approval of their constituents. Their independence has not alone brought the Platt machine to disastrous wreck. It has marked out the line of future action for high-minded Republicans, and has plainly indicated who and what manner of men are to be the real leaders of the party after the defeat of Platt is followed by his complete disappearance.

THE MORAL OF THE CRAMPS.

The reorganization of the William Cramp & Sons' Ship and Engine Building Company of Philadelphia, made public on Tuesday, is of more than local or passing significance. The concern has long been national in its scope; and the fact that a loan of $5,000,000 is now found necessary to keep the business going, and that the creditors are practically to take control of affairs, infusing "new blood" and appointing a new manager, certainly challenges attention.

A part of the trouble has doubtless been "dry rot." Other corporations have in like manner failed from being under the shadow of a mighty name. A man of force and initiative builds up a great business, and it comes to be believed that there is magic in the family. Sons

and nephews are taken in at fancy salaries, as if the special talent which first achieved success were inherited with the name. It is like the English traveller who asked Canova's son if he intended to carry on the dead sculptor's "business." There is a good deal of such unconscious prejudice, or favoritism, in the business world; and behind the prestige of a family name the dry rot does its work. Waste creeps in. Obsolete methods are clung to. Vigilance and strain are relaxed, and suddenly the world is astounded to hear that a firm which had been taken to be synonymous with soundness is in danger of bankruptcy. The Cramps appear to have suffered from such causes.

A deeper reason, however, seems to us to lie in the attitude of limp dependence upon the Government which this shipbuilding company has for many years assumed. It has been one of the most clamorous of the subsidy beggars. It has stood by the Treasury, cap in hand, asking an alms. Government contracts without end have been awarded it, but it has demanded, over and above all those, a bounty on every merchant vessel built in its yards. Yet short memories can recall a magazine article by Mr. William Cramp declaring that our shipbuilders would not need a cent of bounty, provided they could get their raw materials free. He was then for a fair field and no favors. But of late the firm's demand has been for an unfair field stuffed full of favors. It has had at least its full share from the Navy Department, official records showing that, of all the money expended on "the new navy" since 1882, more than 60 per cent. has gone into Pennsylvania, with its steel works and shipyards, and armorplate factories. This fact, by the way, helps us to understand the high degree of patriotism—in the sense of readiness to pick a quarrel, leading to a demand for more ships—for which that State has been somewhat noted. But all that we note now is that the Cramps have had a large part of this Governmental business. If paternalism could have saved them, they would not have discovered their sudden need of more "working capital." Yet it would seem that all the time and money spent in securing navy contracts, and in running to Washington for years to join forces with those who were going in for the old flag and a subsidy, availed only to betray their weakness in the end.

It is an old moral thus pointed afresh. Captains of industry are lords of their own fate. No other, be that other a Government, can save them from the penalties of bad business management. And the worst of the mischief is that the habit of leaning upon Government aid directly or indirectly encourages bad management. Why need we bother to keep our plant up to date, to stop this leak and to prevent that loss? Have we not a generous old uncle at Washington who will make all good? So instead of daily inspection of the actual work, instead of careful planning and constant renewal and the freshening of method, we will spend our time with politicians and lobbyists, and strive to obtain by bounty and largess what can be, in the long run, won only by alert energy and the perfection of power to compete. Do we not see, in the case of the Cramps, one more illustration of the old truth that public cosseting, or the hope of it, cuts the nerve of private enterprise?

We refer to the difficulties of the Cramps without the slightest bias, and only because they illustrate a general principle. They show just what the subsidy-mongers and the protection-peddlers really aim at—a system, that is, under which indolence shall fare as well as the severest toil, and negligence profit equally with assiduous attention to the minutest details. Subsidies and protective tariffs, in short, attempt to take care of the lame ducks. But nature's method is to cast the bantling on the rock; and, when all is said, the methods of business have to conform, in the end, to the methods of nature. Even a long course of artificial feeding cannot save man or company that knows not the spirit of self-help. To put an industry on its own feet, and to keep it there by dint of intelligent and unremitting effort, is far better worth the while of inventors and investors and managers than to be forever appealing to Government for help which will do you no good when you get it.

THE IRISH LAND BILL.

DUBLIN, April 4, 1903.

Irish thoughts and interests are now concentrated on the bill introduced on the 25th of March by Chief Secretary Wyndham. The object of the measure is to offer such pecuniary inducements to landlords to sell and to tenants to buy as will bring out a wholesale, or very large, transfer of ownership without actual compulsion. So far as the landlords are concerned, this has been done. Whereas the selling price of landlords' estates in the best of times was on an average not more than twenty-three years' purchase of the rental, and for the last twenty years about seventeen years' purchase, the price which the bill proposes will be from twenty years' purchase for the worst class of estates to nearly thirty-three years' for the best.

Hitherto, landlord sellers have been paid in 2¾ per cent. stock, worth before the South African war 113, but now only worth 90. Under the bill they will be paid in cash. The money required is estimated to amount to about 100 millions sterling, and is to be raised by the issue of stock carrying 2¾ per cent. interest for thirty years, after which it will be redeemable at par. The payment of the interest on the stock will be secured (1) by the annuities payable by tenant purchasers; (2) by various grants which are now made from the Exchequer in aid of local taxation, for the support of lunatics, police, and for educational purposes; (3) by the local rates, which the Lord Lieutenant can order to be increased in case of any loss by default in payment of the land-purchase annuities.

Under the fiscal system which has been developed by Tory governments during the last twenty years, the three divisions of the United Kingdom receive sundry grants in relief of local taxation, for purposes which previously had been considered to be the special concern of the local governing units. The resulting confusion between local and imperial finance has made all accounts of receipts and expenditure of taxation obscure and often unintelligible; it has made efficient supervision and control by Parliament almost impossible; and the effect of the financial provisions of the Land Bill on the general body of taxpayers will be apprehended by very few persons. However, Mr. Wyndham was able to assure the British taxpayer that he ran no risk; that the loan proposed to be issued was secured over and over again, and that England stood to win financially. There can be no doubt about that, though it may be difficult to ear-mark the particular Irish funds that will be successively liable for the losses that are inevitable in giving the landlords prices for their estates far in excess of any that they ever expected, or would have taken twelve months ago.

Mr. Wyndham anticipated that it would take fifteen years to issue the whole amount of purchase money; and as there will be an immediate loss on the issue at a discount of the 2¾ per cent. stock, the fund made immediately liable for that loss is a yearly grant of £185,000 for educational purposes—a grant made to balance a similar one arranged last year for Great Britain. It was hoped that the now well-ascertained and almost universally admitted overtaxation of Ireland might have been a sufficient reason for throwing the expenses and losses in carrying out this great reform on the shoulders of the whole body of the United Kingdom taxpayers; but that is not to be so. The British rule is, that Ireland is not a separate financial entity when it is a question of increased taxation for British purposes, but that she is, and must bear the entire cost, when it is a question of expenditure on Irish national objects. The British Treasury claimed, when the overtaxation of Ireland was demonstrated to the Financial Relations Commission, that their expenditure in Ireland, pronounced wasteful and demoralizing, should be taken as a set-off. Mr. Wyndham announced that savings made in Irish administration during the last few years amounted to £440,000, and that he hoped to effect very much larger savings; but no intention of allocating these savings to Irish purposes was intimated. The British Treasury must win, and will win largely, over this business.

Now for the tenant purchaser's position. Hitherto he had agreed to buy for a lump sum, which he usually reckoned at so many years' purchase of his rent. He could repay this by paying an annuity of 4 per cent. on the price for forty-two and one-half years; or he might have this annuity reduced by 10 or 12 per cent. at the end of each of the first three decades, and then continue paying 2½ per cent. on the original loan until seventy-two years had

elapsed from the date of his purchase; or he might pay off the whole or any part of the loan at any time. When he bought he became full and absolute owner of his farm. He was proprietor *a cœlo usque ad inferos*.

That is not to be so under the Land Bill. No purchaser will become absolute owner, nor is he to agree to buy for any known sum. He must agree to buy for an annuity which is not to be less than 10 per cent. or more than 40 per cent. below his existing rent; seven-eighths of this annuity will be terminable in sixty-eight and one-half years, and one-eighth is to remain a perpetual charge on the land. Mines, minerals, rights of shooting, hunting, and fishing do not pass to the purchaser, but are to remain the property of the State—*i. e.*, at present, the Treasury. The purchaser will not become the owner; he will be a State tenant, with a right to use the surface of the land for farming purposes only, and without power to explore or develop its mineral resources if they exist, If a tenant wants to know what price he is paying for this limited ownership, he must divide the annuity he has agreed on with his landlord into two parts, and multiply one-eighth of the annuity by 36.36 and seven-eighths by 30.7. The selling landlord will get in addition a bonus of from 15 per cent. on the purchase money of estates not exceeding £5,000 capital value, to 5 per cent. on estates where the total price exceeds £40,000. The purchasing tenant cannot be said to pay this bonus, except so far as he contributes to it as a taxpayer.

Another provision in relief of the landlords is that they may sell their demesnes and home farms to the State, and then repurchase them by means of a terminable annuity of 3¼ per cent. for sixty-nine years; but in these cases the mines, minerals, and sporting rights do not vest in the State. The owners will retain full ownership; they can buy off any rent charges they are now subject to for twenty years' purchase, and, by paying off mortgages on which the interest would usually be from 4½ to 6 per cent., they materially increase their income at the expense of the public.

The entire bonus expected to be given to the landlords during the next fifteen years is estimated at about twelve millions. There are some excellent and unobjectionable provisions in the bill for expediting the investigation of landlords' titles and the distribution of the purchase money. Red tape and lawyers' cobwebs are swept away if the administration act in the spirit in which these clauses are conceived.

Looking at the measure as a whole, I should say it is not fair as between landlord and tenant. It gives the landlord far more than the value of his estate, and does not give the tenant the full ownership that he desires to have, nor adequate consideration for what he will have to pay. It is unfair between Great Britain and Ireland, for it puts an unnecessarily heavy charge on the Irish taxpayer for a reform from which England will derive not only a large benefit, but a profit. It is questionable whether the tenants will be very anxious to buy on the terms offered. They will see the general unfairness of the terms, but they may be driven to accept whatever alleviation of their present burdens is obtainable, as a hungry man might pay a shilling for a loaf when he knew the fair price should be fourpence.

A convention is to meet in Dublin to discuss the bill before it is read a second time. If the finance of the bill as between landlord, tenant, and Irish taxpayer could be clearly explained, I think its rejection would be certain; but there are many persons interested in and desirous of seeing some final measure passed, and it is not likely that country farmers will form a majority of the speakers at the convention.

AN IRISHMAN.

THE RELIGIOUS PROBLEM IN FRANCE.

ITHACA, April 14, 1903.

The campaign against religious and monastic orders, which for the last three years has been disturbing French politics, and which is now once more agitating the national Parliament, is only an episode in the struggle, centuries old, between Church and State. Under the old régime, the question was simply that of establishing the preëminence of the civil power over the power of the Church, and the control by the State over ecclesiastical dignitaries of all degrees. The Church was none the worse for it. It existed as a privileged order, rich and powerful. The Catholic religion formed an inseparable element of the national life. The Church kept the registers of births and marriages, and had all education in its hands. It had the prestige and the power of a State religion. With the Revolution of 1789 the contest entered upon a new phase. The efforts of the civil power were no longer limited to resisting the encroachments of the power of the Church. After effecting more and more the separation of the two powers by restricting ecclesiastical authority to its proper sphere, the State next sought to diminish the influence of Catholicism upon the popular mind. The policy, brutally begun by the Constituante, was continued by the Convention; its effects, however, were not lasting. Napoleon and his successors restored to the Church some of its privileges and a part of its influence. In fact, all the monarchical governments of France found it to their interest to make with the Church an alliance by which both parties profited.

It is only since the establishment of the present republic that the *politique laïque*, the policy of thorough secularization, has been pursued in a manner at once methodical and aggressive. The aim of the republic has been to suppress every trace of religion in the official life of the State and in all the institutions which depend upon the State. The slightest vestiges of the ancient alliance between the throne and the altar, however innocent they might appear, have been one after another obliterated. In 1882 the law of Jules Ferry established definitively the secular character of national instruction. In many places the crucifixes were removed from the schools, and the clergy of all denominations were forbidden to enter. The participation of military troops in religious processions was likewise prohibited. The chaplains in the army were abolished. In 1884 the public prayer which the Constitution directed should be offered at the opening of each session of Parliament, was abolished by the two houses in joint session. In 1889 the clergy were deprived of their privilege of exemption from military service, and the popular cry, "Les curés sac au dos," out of which Boulanger made capital, gave an indication of the spirit in which the new law had been framed. Until quite recently there still persisted two venerable relics of the ancient tradition: the "Red Mass," celebrated in the presence of the magistrates and the bar each year at the opening of the term, and the ceremonies held on Good Friday on all the national vessels of war. During the Ministry of Waldeck-Rousseau these two observances were likewise abolished.

Every year, when the appropriations are voted, a motion is made for the abolition, pure and simple, of the appropriation for the support of religious worship and of the embassy to the Vatican. It is regularly backed by a strong minority. Four years ago, one hundred and sixty-six Deputies even voted for a motion to remove from the French coinage the motto, "Dieu protège la France." It may be added that the Republican party in France is inclined, as a whole, to manifestations of anti-religious feeling. The great leaders of the Republican party, Gambetta, Victor Hugo, Jules Ferry, Floquet, Burdeau, were buried without religious ceremonies. The President of the Republic is held to strict prudence in all religious matters. Félix Faure was ridiculed for having asked the little girls of an orphan asylum to remember him in their prayers. M. Combes was lately hooted at by his own majority for incidentally expressing the opinion that the great mass of the public is not yet ready to be satisfied with purely ethical ideas for a religion. The combination of religious features with matters of government and politics in the United States, as manifested in the invocation of the name of God in official documents, and in the prayers offered in Congress and in political conventions, appear to French Republicans a shocking inconsequence.

One would naturally conclude that the logical result of such a conception would be the complete separation of the churches and the State. Such is, in fact, the case. The platform of the Radical party has always placed this measure among the reforms most urgently called for. But, when in power, the Radicals have never dared to put it into effect; they have feared that such a separation would make the Church too strong and leave the State with too little control over her. This was the belief of Gambetta, of Paul Bert, and of Ferry, the leaders of the anti-clerical movement in the Third Republic. To them, entire separation seemed a course full of danger. Under these circumstances the different administrations have restricted themselves to waging war upon such institutions of a religious character as they have considered unnecessary to the exercise of religion and dangerous to the State.

This is the origin of the famous Law of Associations. This law, passed in July, 1901, contains two threatening sections. Section 13 declares that no religious organization shall be permitted to exist without legal authorization. Section 18 declares that organizations to which authorization is refused shall be considered dissolved. The author of the law, M. Waldeck-Rousseau, a statesman of the anti-clerical, but not of the anti-religious school, desired

simply to reach some of the religious orders taking an active part in politics and in teaching. Both in number and in fortune these had increased to an alarming extent. In 1789 there were in France only 60,000 members of religious orders; today there are 200,000. In a famous speech delivered in April, 1900, Waldeck-Rousseau said, "This country really has too many monks in business and too many monks in politics." He also wished to strike a blow at certain orders which have monopolized in France the education of a large part of the middle class, and which helped to bring up half the youth of France with ideas hostile to the principles of modern society.

M. Waldeck-Rousseau had the law enacted, and then voluntarily withdrew from the premiership. It was his successor, M. Combes, who, with the support of the Radical majority of the new Chamber, undertook its administration. M. Combes himself belongs to the school of aggressive Radicalism. He interpreted the law in its most restrictive sense, and availed himself of every pretext which it afforded for hostile action against the orders. In accord with the advice of a commission, headed by M. Buisson, a distinguished educator, professor of philosophy in the Sorbonne, recently elected Deputy, he decided to refuse authorization to all the orders except those of two classes—the missionary orders and the hospitallers. Last March the Chamber ratified this policy. Fifty-four congregations of men, belonging to three classes, teaching, preaching, and commercial, have been condemned to extinction. By three successive votes, the first of which was of 300 to 257, the Chamber has refused even to consider the petitions of these monks, whether devoted to education, like the Marists and the Eudists; to preaching, like the Dominicans and the Oratorians; or to contemplation and industry, like the Carthusians, the distillers of Chartreuse. Taking advantage of its powers under the law to refuse authorization as it pleases, the Chamber has made a veritable hecatomb. Only a few congregations have survived—those previously authorized, like the Brothers of the Christian Schools and the Priests of St. Sulpice, and the missionaries and hospitallers, whose fate rests with the Senate.

Of course, these radical measures have not been voted without vehement protestations and eloquent speeches. Nowhere are there such splendid debates, from the point of view of oratory, as in France when great political and religious questions come up before Parliament. Two years ago, when the original law was under debate, there were great speeches by M. de Mun and by M. Waldeck-Rousseau; last month, when the application of the law was being discussed, the leading orators were M. Combes and M. Ribot. It would be idle to offer a personal opinion on a question of this kind, which each individual regards differently, according to his temperament, his education, and his principles. I shall therefore confine myself to outlining the arguments of the three parties which have formed themselves in France with regard to the question of the congregations.

In the first place, the supporters of the law are made up of Progressist Republicans who would like to ruin the clerical party, and of Radicals and Socialists whose aim is the destruction of Roman Catholicism itself. Their arguments are various. Against the religious orders in general they urge that these are based upon an inadmissible principle, that of the surrender of personality. "We refuse," says M. Buisson, "to place the seal of the State upon a contract which alienates the liberty of the citizen." The congregations have built up a power which is politically dangerous because hostile to modern institutions, and economically dangerous because it withdraws from general use an immense property held in mortmain. Moreover, in 1792, the Revolution suppressed them by a law which is still in force, and the Concordat did not renew them. They are useless to the real work of religion. Certain congregations in particular are reproached with living by the exploitation of human credulity, and with encouraging what M. Waldeck-Rousseau has termed "a crude thaumaturgy designed to impose upon the mob." This is an allusion to the enterprise conducted by the Franciscans, who collect money for St. Anthony of Padua, in return for which the saint is believed to restore lost articles to their owners. Other congregations traffic in the labor of orphans, as was done by the Sisters of the Good Shepherd at Nancy, recently prosecuted and convicted in the courts. Their establishment closely resembled a sweat-shop. Political congregations have, like the Assumptionists, conducted against the republic, in scurrilous journals of their own, a campaign of abuse and misrepresentation, or, like the Dominicans, have preached from their pulpits against the acts of the Administration or of the Parliament. It is, however, the teaching orders which have aroused the deepest resentment. These offer both primary and secondary instruction, and imbue the minds of the rising generation with ideas hostile to modern progress. M. Bourgeois some years ago read in the Chamber of Deputies passages from exercises written by the pupils of religious schools, approving or misrepresenting the massacre of St. Bartholomew and the Revocation of the Edict of Nantes. From the mere fact that the monks and sisters live apart from society, say the defenders of the law, they are unqualified to form the citizens who are to compose it. "The republic," said M. Combes, "has lavished millions to insure to all its children an education founded solely upon the principles of reason, justice, and solidarity. It would be an act of treason to the republic to annul or even to weaken the effect of this sacrifice, by leaving the way open, as it has been in the past, to the enterprises of the congregations."

To these arguments the Catholics reply that the congregations form an integral part of the Church, and that their history is inseparable from that of France herself. To banish them is to infringe the liberty of those who are called to the contemplative life, a legitimate and honorable life, to which such emancipated thinkers as Taine and Victor Hugo have paid tribute. It is to infringe the liberty of parents who regard the education furnished by the monks as the best for their children. This is the position which was taken by the two great orators of the Catholic party, M. de Mun and M. Denys Cochin.

Between these extreme opinions, the one seeking the total abolition of the congregations, and the other their absolute freedom from control, lies the view of the Liberal Republicans, whose spokesmen in the Chamber have been M. Ribot and M. Aynard, and whose newspaper organ has been the *Temps*. They agree with the Radicals in considering the congregations hostile to modern ideas, in considering the instruction furnished by them insufficient to form good citizens of a democracy, and in regarding with contempt the degrading fetishism which some of them are encouraging. They agree with the Radicals, also, in fearing the dangers of the accumulation of vast properties in mortmain, and are willing to take measures against it. On the other hand, they are not deceived by the appeals to liberty made by the Catholic party when their own liberty is in danger. They know well that, through the ages, the Catholic party has stood for intolerance and fanaticism. Its political creed is the Syllabus which anathematizes freedom of worship and freedom of inquiry, and which declares in so many words, "The Church must not become reconciled to progress, to liberalism, to modern civilization." At the present moment it claims the title of the party of liberty, but is really, as M. Clémenceau said in the Senate, "the party of authority, the party of authority in distress, of authority overthrown." Its policy is that long ago formulated by the famous Ultramontane journalist Veuillot: "When we are in power, we refuse you liberty, for that is our doctrine; when we are out of power, we demand liberty, for it is your doctrine to give it to us."

Despite all this, the Liberal Republicans have not felt themselves justified in refusing even to the congregations the right to exist. Liberty is absolute. One cannot refuse it even to those who do not deserve it. The monks have a barbarous and antiquated notion of life and of its duties; parents who send their children to them must be blind. Agreed. But one and all have the right to make errors of judgment. Liberty includes liberty to err; without that, it is not liberty. If the principles of modern democracy are to triumph, the State must rely not upon constraint, but upon the voluntary support of its citizens. To attempt to base the moral unity of a country upon compulsion, would be to repeat the disastrous experiments of the old régime, and to apply to Catholicism the policy which Catholicism has unsuccessfully attempted to apply to its adversaries.

The Liberal party and the Catholic party have been defeated in the struggle, and the Jacobins have triumphed along the entire line. The observer of modern and liberal spirit, convinced that the social, political, and religious doctrines represented by the congregations are ominous to civilization, remains perplexed and disquieted before this result. On the one hand, he can hardly regret the defeat of a party whose principles are repugnant to him; on the other hand, he can take no pleasure in a victory which, if in accord with reason, is certainly not in accord with liberty.

OTHON GUERLAC.

COURAGE AMONG ENGLISH POLITICIANS

LONDON, April 3, 1903.

Boldness is in England the quality which most attracts the admiration and confi-

dence of the people, and what is true of England is, I take it, true of the United States. Mr. Chamberlain is at this moment the most impressive figure in English public life. Whatever may be his virtues or his faults—and with neither of these is this letter concerned—he to-day commands the trust of the electors. He is applauded by Conservatives who, till 1886, looked upon him as a typical demagogue; he is praised by Liberals who, since 1886, have denounced him as a deserter to Toryism. What is the cause of his present popularity? It lies in the belief of the people that he is a man of vigor and boldness. It is the faith that he has a strength of will and firmness of purpose not possessed by many of our statesmen, which has given him such a hold on popular imagination as falls at this minute to no other leading politician.

Is not the same thing true in substance of President Roosevelt? Your readers must answer the question, but my strong belief is that it will generally receive an affirmative reply. One thing at least is clear to any student of political history. The statesmen whom the English people have accepted as leaders—and there have of course been prime ministers who have really led nobody—have all displayed one (and it may be only one) common quality. They have all been strong-willed men, or at least men whose will was believed to be strong. Palmerston, Disraeli, Russell, Peel, Gladstone, or Bright may be charged with many faults and errors, but no one could seriously bring against any of them the accusation of weakness. Bright's case is peculiarly instructive; his services to the country as member of the Anti-Corn Law League did not in reality give him anything like the influence which sprang from his opposition to the war with Russia. His conduct was at the moment intensely unpopular; there are still living persons—and the present writer is among the number—to whom the wisdom of the course taken by Bright during the Crimean war appears open to the gravest doubt; it assuredly was the chief cause of his losing his seat in 1857 at Manchester. But—and this is the main point to be noted—temporary unpopularity brought to Bright permanent strength. Electors whose wishes he had thwarted and whose feeling of patriotism he had offended, tacitly recognized his bravery. He became known as a strong man who could, at the bidding of his conscience, defy even the sovereign people.

If boldness commands confidence, one might naturally expect that politicians would be bold. Yet the commonest observation shows us that the courage to act boldly and take responsibility, as also the courage to defy the wish of the party to which a man belongs, or, still more, of the nation, is, among the parliamentary politicians of England, the rarest of all qualities. The people look for leadership, and the men who ought to be their guides wait upon the will of the people, and give tremulous attention to the varying and uncertain expressions of popular opinion. Why, one asks, when boldness is admired, do politicians so often lack courage?

Politics in England and at the present day does not lead to wealth; a political career cannot in the twentieth, as it certainly could in the eighteenth century, be looked upon as a profession which, like the bar, might lead to large emolument. One may reasonably doubt whether any living statesman has gained by office much, if anything, in money. If our public men are wanting in boldness, the reason assuredly is not that political defeat means to them loss of wealth. Nor, again, can the phenomenon which we are examining be explained by the evils, great as they are, of partisanship or faction. A political, no less than a religious zealot may be the boldest and most reckless of mankind. It cannot, again, in fairness be alleged that want of courage is due in the main to want of principle. Even adventurers are often bold, and an average member of Parliament is rarely an unprincipled adventurer. He is a respectable man of respectable abilities, who practises in life the ordinary morality of his generation, which is in many ways as high as the moral standard of public life in the eighteenth or in the earlier part of the nineteenth century; probably, indeed, it is a good deal higher. The famed disinterestedness of Chatham and his son throws a good deal of indirect light upon the corruption which was prevalent in the days of each of these statesmen.

The true causes of political cowardice, the reasons which lead men of real respectability in all private affairs to exhibit a timidity which is certainly not to be respected in their public life, may be referred to three different causes which are apt to escape notice.

The boldness or independence, in the first place, which gains public confidence for a statesman is not a quality that helps him to acquire the position in which he can exercise statesmanship. A local wire-puller may not be a very admirable sort of person, but, like other experts, he understands his own business; and if he is in search for a parliamentary candidate, he assuredly will not prefer the ablest or the boldest man on whom he can lay his hands. He wants not the man who has most character, but the man of a pliant disposition—the man who, within the range of his party, can be all things to all men, and accommodate himself to the wishes or the whims of the voters. The dictum ascribed in England to some eminent American, though I know not to whom, "I should make a first-rate President, but an execrably bad candidate for the Presidency," contains, whoever uttered it, an important truth of the widest application: practice of the arts, even the legitimate arts, by which a candidate gains a seat in Parliament, is not good training for the exercise, when the seat is gained, of statesmanlike boldness. He who has devoted himself to pleasing electors is certain to be nervously afraid of their displeasure.

The loss, in the second place, of a seat in Parliament, though it may in no way affect a man's fortune, is likely to cause him far greater pain than is at first apparent to outside observers. The vote or the speech which loses the support of a member's constituents is given or made subject to a really severe penalty. The punishment or loss is nothing less than the expulsion, certainly for the moment, and possibly for ever, from a pursuit or profession in which the defeated candidate has learned to take pride and pleasure. Take the case of a man of known respectability and worth who has been, say, for twenty years a worthy member of the House of Commons. His position has given him a certain dignity or credit in the town or county where he lives; his words are listened to with more attention than the utterances of his neighbors; his speeches are reported in the local papers; they occasionally attract the notice of the London *Times*. During the Parliamentary session his occupations, his interests, his society, are all dependent upon his forming part of the House of Commons. Can any one wonder that such a man should dread to oppose the publicans, the temperance men, the clergy, or the workmen whose votes may deprive him of the honor of representing Little Pedlington, and thereby force him to change his whole manner of life, and deprive him, at an age when he is too old to find new occupations, of everything which has made the interest of his daily life? The M.P. who loses his seat suffers much the same kind of distress, conceal the fact as he may, as would a barrister if disbarred, or a clergyman if forced, say, by conscientious scruples, to give up his position in the Church. Our defeated candidate may, it is true, reënter Parliament; and as regards the leading statesmen of the day, the conviction that they cannot remain long excluded from the Parliamentary arena does undoubtedly contribute to give them such bravery as they display. Balfour, Chamberlain, Campbell-Bannerman, or John Morley, may feel assured that a defeat at an election means nothing more than a temporary holiday, after which they can each of them resume Parliamentary work; but with the Member for Little Pedlington and indeed with most men who have not sat long in Parliament, it is otherwise. Exclusion from Parliament for one session may likely enough mean exclusion for life. One reason why politicians with aristocratic connections show occasionally exceptional independence is that they hold their seats in Parliament by a comparatively secure tenure.

Sovereigns, in the last place, are always flattered, feared, and admired. This is as true of the sovereign people as of kings; the worship of the democracy is due to exactly the feelings which led courtiers not only to flatter, but, what is more strange, to revere Henry VIII., Elizabeth, and James. The flattery of course springs in no small degree from self-interest. Kings, when really powerful, could exclude men from public life; they could mar the career of a man of genius just as an offended democracy can exclude from Parliament men who are rightly conscious of the gifts which qualify them for a high place in the public service. But neither self-interest nor the meanness of human nature will at all completely account for the genuine admiration kindled by sovereign authority. It is idle to suppose that the adulation offered by men such as More or Wolsey to Henry VIII., or by Bacon to James I., was wholly insincere. Individuals may debase themselves before utterly unworthy idols in obedience to private interests, but a nation cannot be the slave of such corruption, and the whole English people idolized Elizabeth in spite of her fickleness, her vanity, and her meanness. The source of this worship lay at bottom in the almost instinctive tendency of human nature to believe that might must in some way be connected with right. Where men see supreme power, there they long to see extraordinary wisdom, and the desire for illusions never fails to meet with grati-

fication. To the sovereign people is unconsciously attributed a mysterious kind of insight. A modern politician finds it all but impossible not to bow to the will of the people, because at the bottom of his heart he half believes that the voice of the people is in some strange way the voice of God. How can any politician in a democratic society fail to lack courage when he is called upon to resist his political Deity?

AN OBSERVER.

Correspondence.

TELEPATHY ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: However science may be *made* by lonely men observing natural facts and meditating on their meaning, science prevails at last and is disseminated through the public by authority pure and simple. Innovations in science may long be barred from general recognition by the authority of those who hold conservative views. My learned colleague, John Trowbridge, in his article entitled "Telepathy," in your last week's number, presses with all the weight of his authority against the door which certain "psychical researchers" are threatening to open wide enough to admit a hitherto discredited class of facts. His reasonings will soon be forgotten by readers who will yet remember his name and quote his hostile vote if it be left to go unchallenged. So you will, perhaps, allow a lover of fair play, not to discuss telepathy itself, which would indeed be a complicated matter, but to inscribe against Professor Trowbridge's manner of discussing it a protest which some such readers may also happen eventually to remember.

Professor Trowbridge says that there is "no science in the subject of telepathy; it is a belief." So far, he thinks, as men who have made their reputations by accurate work may be counted among its believers, they are men of advancing years who have abandoned strenuous investigation with its small returns, and "find it easier to philosophize and to write out their thoughts than to put them to the test of experiment. When a scientific man," he adds, "takes to such work in psychics and philosophy, the death-knell of his scientific career is rung."

Heaven forbid that the death-knell of my colleague's scientific career should be rung yet, but he has described to a dot his own contribution to psychics and philosophy in this article. He seems to me to have found it easier to philosophize and write out his thoughts than either to experiment or to read the experiments of others, preferring to follow an *à priori* mental image which he has framed, of all the possible evidence for telepathy, and then to lump all possible students of it together in advance as a set of irreclaimably vague "believers."

I do not here assume to say that the various investigations recorded in the Proceedings of the Psychical Research Society have placed "telepathy" in an invulnerable position. Far from it. But I do say that Professor Trowbridge's description of such investigations so little resembles the reality as to be unrecognizable. I find it hard, after reading his article, to believe that he himself has read with any care, or even read at all, such documents as Gurney's Phantasms of the Living, or Mrs. Sidgwick's report on the Census of Hallucinations, or her and Professor Sidgwick's Observations on Thought Transference, and the discussions consequent thereon. Yet how can one effectually criticise evidence with which one seems to have no detailed acquaintance? I write, therefore, to beg Professor Trowbridge's readers and mine not to bow down before mere disparaging generalities and abstract statements, by whatsoever eminent authority they may be published, but rather to go to the original documents themselves, filled as they are with painstaking and minute discussion. Certainly it is not in their pages that the subject is treated with the greater vagueness or inaccuracy.

No man or set of men can be expected to be accurate "all over." Like the body, the mind grows slack when not kept up to standard by incessant training. Within their several sciences, men of science keep each other up to standard by their merciless habits of criticising. But "psychical research" is a dog with so few friends at court that almost any stick seems good enough to beat him with; and I venture to suggest that Professor Trowbridge (like many another physical philosopher who has written on this extraneous theme) has felt so confident of indulgence from his immediate professional fellows, whatever might be his line of argument, that he has let himself go, and indulged in conclusions based on a knowledge of the state of the question which in any matter of pure physics he would have considered unpardonably superficial, and which is certainly so superficial here as to be almost irrelevant. To use his own words, he has "found it easier" to follow unscientific methods.

WILLIAM JAMES.

CAMBRIDGE, MASS., April 18, 1903.

ENGLISH DISCOVERIES IN ANTARCTICA

TO THE EDITOR OF THE NATION:

SIR: An article in the April number of the *Geographical Journal*, the data for which were telegraphed to England, shows that the English Antarctic expedition has made some important discoveries. That of "an extensive, heavily glaciated land with occasional bare and precipitous peaks" in 76 degrees south latitude, 152 degrees thirty minutes west longitude, is significant. In the first place, it is now evident that the so-called Great Ice Barrier is simply the sea front, five or six hundred miles long, of a great glacier, which, much like Muir Glacier, stretches as a perpendicular ice wall along tide-water between two mountainous promontories. Some idea of the size of this glacier may be obtained if one imagines the entire west coast of France fringed by a wall of ice four or five hundred feet high, extending from the Pyrenees to the cliffs of Dover. It would be contrary to all our knowledge of glacial phenomena to suppose that this colossal glacier is afloat, except, perhaps, at its extreme sea front, and probably it rests upon a low plain, which may lie even below sea level, but which surely connects the mountains of Scott Land and Victoria Land.

But the discovery of Scott Land has a still greater significance; for, taken in connection with the discovery by De Gerlache that the ocean bed in about 70 degrees south latitude and 80 to 100 degrees west longitude is shallow, it goes far to show that the coast line of Antarctica, on its Pacific-Australia side, is fairly continuous from Palmer Land in 56 degrees west longitude to Termination Land in 100 degrees east longitude, and there can be little doubt remaining that Antarctica is a continent of still uncertain breadth, but of a length of about three thousand miles.

EDWIN S. BALCH.

PHILADELPHIA, April 20, 1903.

Notes.

With a view to the preparation of a Memoir of the late Edwin L. Godkin, it is requested that his correspondents who may have preserved letters from him available to that end will send them to Mr. Lawrence Godkin, 56 Wall Street, New York. They will be returned in all cases when merely loaned.

One result of the merger of R. H. Russell with Harper & Bros. is that the new Gibson books will hereafter be published by the Scribners; that for 1903 in the autumn. This firm announces a new volume of stories by F. Hopkinson Smith, 'The Under Dog,' and a novel, 'The Modern Obstacle,' by Alice Duer Miller.

John Lane has nearly ready 'The American Advance: A Study in Territorial Expansion,' by E. J. Carpenter.

From the Chicago University Press will issue 'The Place of Industries in Elementary Education,' by Katharine E. Dopp, and 'The Diary and Letters of Wilhelm Müller,' father of the late Max Müller, by Philip S. Allen and James Taft Hatfield. The diary covers only a little more than a year (1815-16).

What must eventuate in a book is the series of papers soon to begin to appear in the *Century*, from the pen of Andrew D. White, consisting of reminiscences of his diplomatic life.

Dana Estes & Co., Boston, have in preparation 'Among the Great Masters of Drama,' by Walter Rowland; 'The Year's Festivals,' by Helen Philbrook Patten; and 'Some Famous American Schools,' by Oscar Fay Adams.

The Oxford University Press announces 'Napoleonic Statesmanship: Germany,' by H. A. L. Fisher; and Essays by a Hausa named Ibrahim, with translation, vocabulary and notes by W. H. Brooks and Lewis H. Nott.

'Ireland and her Story,' by Justin McCarthy, will be the thirteenth volume in the series, "Story of the Empire," published by Horace Marshall & Son, London.

A cheap but not uninviting handy volume, rightly professing itself "a book for every parent," is 'How to Bring up your Children' (London: Low; New York: A. Wessels Co.). "Being Some Thoughts on Education by John Locke" reads the sub-title, more accurately stated at the beginning of the reprint as "Some of Locke's Thoughts concerning Education." This most fruitful of tracts was well worth another edition, abridged inevitably. The extensive cuts are disguised here, first by suppression of the section numbers, and there are silent omissions even in sentences; but we have not detected any squeamishness such as

former editors have shown in changing (for example) "stinking breath" to "'fetid"—in fact, the editor disclaims any tampering with the text. He leaves out the precept about daily bathing of the feet and the wearing of leaky shoes for hardening against colds, the having no set time for meals, etc. What remains is all stimulating, if not to be followed to the letter.

'N. W. Ayer & Son's American Newspaper Annual' (Philadelphia) for 1903 brings its ever-swelling measure of statistical information, clearly and orderly displayed; serving also, apart from the main theme, as a convenient gazetteer of the United States and Canada. The editor reports a net gain of 382 newspapers and periodicals during the twelvemonth, the largest gain since 1897, but curiously localized. The increase of dailies in this country "is largely due to the extension of the Rural Free Delivery System, which has caused, in many cases, the establishment of new dailies, or the change from weekly or other issue to daily. The discontinuance of the weekly edition of leading newspapers is becoming increasingly noticeable." Care has to be exercised by the editor in not entering new periodicals from the first number, not a few of them never going further. Much else is to be learned from this painstaking and authoritative repertory.

"The Nation Back of Us"—one-half of the motto of Mr. Lummis's monthly magazine *Out West* (Los Angeles, Cal.)—appears to be justified by the surpassing fulness of the seventeenth bound volume just to hand, exhibiting, as usual, the greatest variety of illustrations. There is the customary series of articles descriptive of localities. Irrigation is to the fore in the department entitled "Twentieth Century West." The practical, conservating Landmarks Club and the uplifting Sequoya League ("To Make Better Indians")—would that this last had its correlative at the South—are here traceable in their membership and doings. For the scholarly part, the editor concludes the Diary of Fray Junípero Serra, and gives liberal extracts relating to early English voyages to the Pacific coast of America, from Sir Francis Drake. There is hardly any interest pertaining to the Pacific slope that does not find some echo in this rich miscellany of fact and imagination.

'My Woodland Intimates,' by Effie Bignell (Baker & Taylor Co.), is a series of nature sketches, the scene of which is, in most cases, the immediate surroundings of the writer's home in eastern New Jersey. Mrs. Bignell gives her impressions and experiences among the trees and flowers of her small domain and the little creatures in fur and feathers that frequent it. Two attractive chapters tell how squirrels learned to come in at her window and take food from her hands, and how the birds resorted to the feasts she daily spread for them on lawn and window-sill. While the sketches lack the interest and virility that characterize the work of our best writers on such subjects, they are pleasant in style and sincere and modest in tone.

Among the recently published books on the Old Masters, written with too rare exceptions by uncritical compilers or glib journalists, Dr. G. Gronau's little volume on 'Leonardo da Vinci' (London: Duckworth & Co.) stands out as the work of an expert connoisseur, cultured scholar, refined critic, and delicate writer. A sketch of the artist's life is followed by an account of his few but matchless achievements. Here the reader will find not only all he need know about their genesis, but appreciations no less delightful than illuminating. The brief but adequate sketch ends with a number of significant passages from Leonardo's 'Treatise on Painting.' It is seldom that one can differ on even small points from Dr. Gronau's conclusions. Over forty illustrations, excellently reproduced, comprising all the master's paintings and the most interesting of his drawings, enable us to follow the writer step by step.

The collaboration of two sensible Englishmen, E. T. Benson and E. H. Miles, whose personal habits in relation to flesh, alcohol, tobacco, and some other matters are antipodal, has produced a very rational, untechnical little book on 'Daily Training' (New York: E. P. Dutton & Co.). We commend it for careful reading by all who have the care of youth of either sex, although the authors appear to have boys chiefly in view. When it has been absorbed by the masters and certain minor factors of local character have been eliminated, let it be transferred bodily or by indirection to the pupils. The influence of training on mind and morals occupies a chapter whose supreme sense every man of middle age, especially if city bred, must concede. He may regret that the guardians of his own youth had not inculcated those principles, but it should not be too late for him to confer their benefits upon his adolescent successors.

The 'Manual of Bacteriology' of Drs. Robert Muir and James Ritchie, revised and edited, with additions, from the third English edition by Norman MacLeod Harris (Macmillan), is a clear and well-developed exposition of the present state of the science. It is a working manual for the laboratory, which also is intelligible and should be interesting to many not qualified for the personal management of culture tubes and immersion lenses. Practical interest in this study lies in its relation to so many diseases which play havoc with human life. Not merely hydrophobia and tetanus, which are rare, typhoid fever and tuberculosis, always with us, cholera, an epidemic of slaughter, and leprosy, communicable and as yet incurable, but also the more familiar pneumonia and inflammatory rheumatism, although not so regarded popularly, all are of bacterial origin. The list is constantly growing. The domain of bacteriology includes the theory of immunity and of recovery from disease, methods for purifying sewage, a study of soils, water, and air. It touches human life at almost every physical point. All along these lines the Manual is clear and intelligent, and, where a topic remains *sub judice*, it frankly says so. It is sufficiently contemporaneous to include the remarkable discoveries of Reed and his colleagues about yellow fever, and it does not appear to omit any established or probable fact. Comparison with the excellent first edition (1897) shows this to be a real revision, and the book is not only much larger, but in every way more complete. To those who know the first, that should mean high praise.

The *Burlington Magazine*, which begins its series with the recent March, quite keeps its promise of distinctiveness of scope and beauty of form. It is a matter of some pride to Americans that Mr. Bernhard Berenson should have the place of honor in his scholarly article, "Alúnno di Domenico." He ascribes to a disciple of the great Ghirlandajo a number of panels, notably the Nastagio degli Onesti series, credited by Vasari to Botticelli. The disciple of Domenico was also, it would seem, a prolific illustrator towards the end of the fifteenth century. Of even greater importance is a first instalment of Mr. James Weale's "The Early Painters of the Netherlands," devoted chiefly to Hubert van Eyck. Mr. Herbert Horne believes that he has discovered copies from which may be reconstructed "A Lost Adoration of the Magi" by Sandro Botticelli. Decorative and applied art is represented by an article on "French Furniture of the Louis XIV. Period," by Émile Molinier, a study of Oriental carpets, one on tinder-boxes, and a description of the Hôtel de Lauzun at Paris. Pure archivism claims only Mr. C. J. Ffoulkes's "The Date of Vincenzo Foppa's Death," in which, by a study of new records, it is shown that Foppa worked well on into the sixteenth century, twenty years or so longer than was formerly supposed. The volume—for such it is, in fact—closes with a review of recent acquisitions by the London Museums. It will have appeared already that the new magazine appeals primarily to collectors and connoisseurs, but bibliophiles are also in mind, for it is printed in large quarto on excellent paper, and full half the illustrations are in collotype or similar process on Japanese vellum. A supplement containing news of art sales will accompany each monthly number. At a dollar a number or $10.80 a year, it is good value. The American agents are Samuel Buckley & Co., No. 100 William Street, New York.

In the February Bulletin of the American Geographical Society Mr. George S. Morison, of the Isthmian Canal Commission, gives an interesting account of the Isthmus of Panama with regard to the canal and the engineering difficulties. This route, though superior in no one respect to any of the others, has many less bad features than any other. The Culebra cut should be attacked first, and, when that is finished (in about ten years after work is begun), all the rest of the canal will be finished at the same time. Lake Bohio, to receive the excess of discharge of the Chagres River, will be more than twelve miles long. Mr. Carl Lumholtz, in the same number, has an article on the Huichol Indians, which should be read in connection with our late notice of his book. Mr. William A. Shedd remarks upon far travellers among the Syrians of Persia and eastern Turkey. In a remote village, Mar Zaya, in a rugged valley on the borders of Persia, in the shadow of a massive old church, reputed to be 1,500 years old, there live men who have had adventures in every part of the world. He says that he has seen letters from or concerning them from Austria, England, America, Dahomey, Cape Colony, India, South America. But it is uncertain whether these are the vagrant beggars of whom he has just been speaking, or the handicraftsmen.

In the *National Geographic Magazine* for April the editor, Mr. G. H. Grosvenor, gives an interesting account of the domestication of reindeer in Alaska. The enterprise, as our readers are aware, originated with Dr. Sheldon Jackson, the general agent of edu-

cation, who twelve years ago brought a herd of sixteen from Siberia to Unalaska. Now there are nearly 6,000 head in the various herds distributed along the coast, and, considering the fact that there are 400,000 square miles of tundra covered with the long fibrous white moss which is the food of this animal, their number may be increased to a million within the next twenty-five years. The business of reindeer raising is a profitable one. "A fawn during the first four years costs the owner less than $1 a year. At the end of the four years it will bring at the mines from $50 to $100 for its meat, or, if trained to the sled or for the pack, is easily worth $100 to $150." The cultivation and preparation for the market of the agave or henequen, often called sisal hemp, is described by Mr. E. H. Thompson, our consul at Progreso. Most of the exported material, amounting to 600,000 bales, worth $14,000,000 in 1902, comes to this country, where it is used for sacking, cordage and binders' twine. Both articles are profusely illustrated.

The German colonies in Palestine, as described by Dr. Saad in Petermann's *Mitteilungen* number one, seem likely to have a not unimportant influence upon the future of that country. There are several small settlements, and three with from 300 to 600 colonists, mostly members of the Tempelgesellschaft, a society formed in 1853 for the restoration of primitive Christianity and the rebuilding of the Temple at Jerusalem. Their simple lives and industrious habits are not without effect upon the natives about them, who are beginning to learn from them improved methods of cultivating the ground. A most attractive picture is drawn of the Haifa colony, with its street nearly a mile long, lined on both sides with charming two-story European houses embosomed in cypress and fruit trees, while far up the green slope of Carmel extend their gardens and vineyards. They have excellent schools, with more than a hundred pupils in two of them. A serious obstacle to their continued prosperity, however, is the extreme difficulty of acquiring more land, as they have outgrown the capacity of that originally granted them. Other articles are descriptive of Savaii, the largest and least known of the Samoan group, and of the volcanic eruption on 1t October 31, 1902, and of the Siberian coast territory, with numerous facts and statistics relating to population, products, industries, and commerce.

A valuable summary of the provisions of the New Zealand "Industrial Conciliation and Arbitration Act of 1900," which has thus far given fairly good satisfaction, is to be found in the Consular Reports for March. Among them is one intended to prevent the needless multiplication of industrial unions, and also one affirming that "every industrial union can sue, or be sued, for the purposes of the act by the name by which it is registered." Our consul-general at Berlin shows how the new German tariff is likely to affect the future import trade of Germany from this country, and describes, with illustrations, a new device for preventing railway collisions by means of a light third rail forming a continuous conductor. A review of our foreign commerce in 1902, by the chief of the Bureau, shows that "there has been recovery in the export of factory products during the past year," but warns of the danger of "another glut." Referring to the publications of the Bureau, he states that there is a widespread demand for them on the part of colleges and schools as reference books in special courses of commercial instruction.

The *Korea Review* opens the year with papers on native astrology, and is full of matters of local interest, including good full-page photographic reproductions; but the paper of greatest historic interest describes a journey made between the two chief ports on the eastern coast of Korea so rarely visited by foreigners. It was made on pack pony from Fusan to Wonsan by the Rev. H. Burkwall, through what was, during the splendid Buddhist age, A. D. 400-1392, the flourishing kingdom of Silla, with which the Arabs traded, and which the Chinese sea captains reached by using the mariner's compass, as is recorded, in the twelfth century. Besides other ruins of ancient cities, there are, near the city of Kyong-ju, thirty-four high mounds, about fifty feet high, in which, according to Korean folklore, the "magic golden measure," which fills so large a page in the vernacular stories, was hidden by the king, when demanded by the Chinese Emperor, who had heard of the fame thereof. One bell, over ten feet high, with its Chinese characters nearly undecipherable through wear, has sent out its mellow notes for more than twelve hundred years. Thirty mounds, seventy-five feet high, were counted within sight of a circular edifice of masonry formerly used as an astrological observatory. Ruined stone pagodas and other evidences of wealth and power, with alas! also, the disafforested mountains, testify to the wealth and greater population in a more brilliant age, from which many believe the Koreans are degenerate through bad government.

The Japanese Minister of Finance has issued his second 'Annuaire Financier et Économique du Japon,' covering the operations of 1902 (Tokio: Z. P. Maruya & Co.). Beside numerous tables, its broad pages contain much matter relating to railways, banks, mines, commerce, and other sources of income; but the most interesting feature is a map of the empire, including Formosa and Yezo, which shows the various railways, both completed and projected, whether owned by the Government or by private parties. The lines of great Japanese steamship companies, four in number, are also marked, together with the important ports, headquarters of army divisions, and naval stations, presenting a most interesting bird's-eye view. It is now possible to travel by railway from the Japanese Dan to Beersheba, or from Awamori to Kagoshima, making ferry at Shimonoseki. In western Kiushiu, between Osaka and Kioto and Nagoya, and in the region around Tokio, the network of railways reminds one of Illinois or New Jersey. Although mining will never make the Japanese Empire rich, yet scientific methods have quadrupled the output of the old lodes, and industry and freedom of trade are steadily and healthfully increasing the wealth of the nation. The multiplication of ships and steamers makes the old junk more and more of a curiosity. Besides the extension of railways, we note that telegraphic wire in use has lengthened from twenty-two thousand miles in 1892 to sixty-seven thousand in 1901.

Americans who, after enjoying "Hildebrand's" 'Camera Obscura,' have wrestled with its idioms in attempted translation, will be interested with others in learning of the decease and posthumous honors accorded to its author, Dr. Nicolaas Beets of Utrecht. It is generally agreed that 'Camera Obscura' is the finest piece of prose in nineteenth-century Dutch, though this was also the time of the great stylist and critic, Busken Huet. Nevertheless, intensely idiomatic as it is, and wonderfully expressive of pure Dutch thought and life, it has been translated into several modern languages. Born on September 13, 1814, at Haarlem, the son of a famous chemist, Beets studied at Leyden, and came under the influence of the poet, J. P. Hasebroek. Made a doctor of theology in 1839, he served in the pastorate until 1854, when he was called to the professorship of theology at Leyden, and lectured until 1875. Though best known by his prose writings in belles-lettres, his critical essays and theological works, he also wrote verse. A complete edition of his poems in four volumes was completed in 1881. Of these, probably his "Corn Flowers" (*Koren-bloemen*) are the most popular. At the time of Queen Wilhelmina's coronation in 1898 he composed an ode full of force and fire, which pleased and surprised his admirers, otherwise the whole Dutch world. The handsome old gentleman, who spent his latter days in Utrecht, always gave a sunny welcome to Americans. At his imposing funeral, with tens of thousands of people lining the streets, the Queen was represented by the royal chamberlain, Baron van Boetselaer, Premier Kuyper, Cabinet Ministers, the Presidents of the two Chambers and a score or more of the members, and the provincial Governor, besides many men eminent in the kingdom, and a vast array of students from the University. The one decoration at the funeral, which was purposely of the most simple character, was a wreath of palms sent by the Queen.

—It is a disappointment to find no frontispiece to volume iv. of 'The Letters and Literary Remains of Edward FitzGerald' (Macmillan). However, in the fifth volume we are shown his schooner yacht, the *Scandal*. The letters come to an end in volume four, and the desideratum of an index has been recognized, yet hardly in the true spirit. Readers will be thankful for the clearing up of the FitzGerald connection, but there has been no consistent and satisfactory treatment of subjective and objective, of that which is autobiographical and that which is historical and critical. Those most precious literary and personal judgments which are the salt of the correspondence should have been placed in compartments in a subsection under the general rubric of FitzGerald, with cross-references from the several persons implicated. Everybody knows Old Fitz's dislike for Browning and for Mrs. Browning, but there is no independent entry for either here, though the Browning Society gets in. We look in vain anywhere for "Daddy" Wordsworth, for Carlyle's favorite nickname. The meerschaum relic of Carlyle is unmentioned under that writer's name, and the Naseby monument affair must be sought in several other places instead of being grouped under the prime

mover. The index, finally, should not simply have marched with the text, but should have been chronologically ordered. We feel confident that the public, in spite of the multiplicity of editions, will still call for a new one of the complete Letters, when an indexer of skill and *con amore* should be employed to build upon the present basis a key leaving nothing to be desired. Volume five contains the six dramas from Calderon. Two more volumes are due.

—An American novel of the day begins: "Every man, woman, and child has their price"; to which saying of a noble lord "my mother" responds, "Bad grammar and a false creed." The good woman may be right; but, impatient of reconstructing so complex a distributive subject, with its confusion of genders, English idiom tends to indulge in just such vagaries of predicate. Under *everybody*, the Oxford Dictionary supplies examples from Lord Berners (*c.* 1530) —and it is the earliest quotation for the locution: "Everye bodye was in theyr lodgynges"; from Bishop Warburton (1759): "Every body else I meet with are full ready to go of themselves"; from Byron (1820): "Every body does and says what they please"; from Ruskin (1866): "Everybody seems to recover their spirits." Now, in the April quarterly instalment of the Dictionary (Henry Frowde), Dr. Murray remarks, under *or:*

"When singular subjects (substantive or pronoun) are coördinated by *or*, strict logic and the rules of modern grammarians require the verb and following pronoun to be in the singular; but at all times there has been a tendency to use the plural with two or more singular subjects when their mutual exclusion is not emphasized. When the subjects differ in number or person, the rule is that the verb and pronouns should agree with the last or nearest, . . . but such constructions are apt to seem stiff and pedantic, and are consequently avoided. The question of gender causes further complications—especially the want of a third-person pronoun of common gender. . . . These difficulties appear to have been felt at all times, and have been sometimes avoided by making the verb immediately precede or follow the first subject, and agree with it."

In Van Tyne's recent collection of the Letters of Daniel Webster is copied a report of that statesman's bitter interview with Stetson of the Astor House, which the editor cannot authenticate except from a newspaper clipping. Doubt might seem to be cast upon its literal accuracy by the phrase, in Webster's mouth, "they had neither the courage *or* kindness to place," etc. But Dr. Murray has a rather full section to show that "*or* sometimes occurs also after *neither*, where the normal conjunction is *nor*." Lord Berners is cited here again, and the usage comes down by way of Lord Herbert, Burke, Heber, Ruskin, and Freeman.

—Among the numerous accounts of suffixes, that of *-or* will arrest attention in this country. This suffix represents ultimately "Latin *-or*, *-orem*, in nouns of condition from intransitive verbs in *-ēre*, less usually from other verbs. . . . Such of these as existed in Middle English were formerly spelt with *-our*. . . . In other words of the same class, . . . as also in some words not directly connected with extant Latin verbs, . . . *-our* is generally retained in British usage, but American usage spells these also with *-or*." Another class, representing Latin agent-nouns, and of different ages going back to old French words in *-or*, *-ur*, were likewise spelt *-our* in Middle English, but "are now all conformed to the Latin spelling in *-or*." Still other classes of agent-nouns have obeyed the same drift, so that American uniformity of usage is decidedly with the British majority. In connection with another suffix, *-ose*, points are given to Littré in the derivation of *glucose*. The whole work on the particles beginning with O deserves study. It has been very laborious, and has broken much new ground. The word *order* reveals inextricable disorder in its development. *Orb* and *ordeal* afford capital examples of the historical method applied to lexicography. So *orange*, as the color badge of loyalty to William of Orange; *Orangeman*. Orange blossoms as associated with the marriage ceremony appear to have come in from France in 1820-30. *Orthodox* arrives late, in Cotgrave 1611 and Bacon 1615. Its immediate origin is obscure; ultimately it goes back to the Greek *via* French (1488) and Latin. The Latin form could, we think, have been little familiar when Erasmus introduced it (1524) in his 'Colloquies' ("Inquisitio de Fide"), where it continued to be glossed even as late as Roger Daniel's London edition of 1655, and later across the Channel; and perhaps Erasmus most widely paved the way for its modernization. Littré's first citation is from Pascal's 'Provinciales' (1656-57). Here is a suggestive extract from Dr. Murray's prefatory note: "One inconvenience of a composite language is seen in the fact that there are seven distinct words spelt *ore*, which moreover occurs as an obsolete spelling of seven others." How would this inconvenience be mitigated by the application of phonetic reform, bringing all into line with *or* (which numbers five words or spellings), to say nothing of *o'er*? In conclusion, we may not overlook this "modern instance" introduced under *opus:* "How goes the *magnum opus?* What letter are you working at now [*videl.* in the Scriptorium]?"

—'The Baptists,' by Dr. Henry C. Vedder, is one of a series, "The Story of the Churches," projected by the Baker & Taylor Co. The volumes are small duodecimos, attractively printed and bound, numbering about 200 pages each. 'The Baptists' is well written, but the tendency of so much compression is to squeeze out every picturesque element and to make the representation purely external. The Baptists are defined as a religious body loyally obedient to the commands of Jesus Christ. It is not made clear why feet-washing does not stand as firmly on this basis as baptism or the Lord's Supper. There are chapters on the history of the Baptists and on their rise and progress in Great Britain and on the Continent. The movement of this history is backward, and stops at the twelfth century, though there is much in the early Christian centuries that is grist for the Baptist's mill. If Münzer is declared to have been no good Anabaptist, on the other hand the glorying in Bunyan is moderate. Clearly the rejection of infant baptism did not imply the adoption of immersion. It is even doubtful in what manner Roger Williams and his friends baptized themselves. A very interesting aspect is the affiliation of the Baptists in their early course with other bodies, notably with the Congregationalists and Quakers. The attempt to account for the slow growth of the Baptists in England furnishes some of the most important pages. We come to the beginnings in America at page 135, when we are more than half-way through the book. Whitefield is credited with saving the American Baptists from the atrophy which has overtaken the English branch. There is also much emphasis on missionary enterprise, but none on that careful study of the Bible which has been so characteristic of the Baptists, and which, in these days of the higher criticism, is potential of incalculable change.

—Dr. C. L. Thompson's contribution to the same series is 'The Presbyterians.' The difference of its method from that of 'The Baptists' suggests a doubt whether the series has any general editorial supervision, especially as no such supervision is explicit. Here there is slight and almost casual reference to the European origins, a fact which shows the writer astonishingly neglectful of the most interesting and dramatic elements of the history set for him to rehearse. Presbyterianism as it appeared in Geneva, France, Holland, and England, offers so much that is attractive that, possibly, Dr. Thompson refrained from treating it expansively for fear that the American development would, by force of contrast, appear even more monotonously dull than standing by itself. But probably the limitation of his space was the decisive circumstance. In his account of the Massachusetts settlements there is a disposition, or a tendency, to confound the Puritan with the Presbyterian to an undue extent. There is no more interesting chapter than that on "The Division of 1741," which marked a conservative reaction from the "Adopting Act" of 1729, "the banner," Dr. Thompson says, "under which the Presbyterian Church in this country has marched to its proudest victories." It does not appear that there was much infusion of that spirit which in England simultaneously was making the Presbyterian chapels refuges for Unitarian heretics. Dr. Thompson may well "point with pride" to the assimilation of the National Constitution of 1787 to Presbyterian governmental forms; but what of the miserable survivals of the ecclesiastical system that exist in the township representation of Connecticut and Rhode Island? The relations of the church to slavery are treated in a franker manner than is common with the church historian, but as respects the recent "confessional changes" there is the habitual disposition to affirm that they do not affect the Westminster "substance of doctrine."

—The late war first attracted popular attention on this side of the ocean to the intellectual and social disintegration of the Spanish people. The serious problems which confront the future of Spanish culture have not been neglected by the best minds in Spain itself, and in his latest book, Prof. Rafael Altamira, editor of the *Revista Crítica de Historia y Literatura Españolas*, and the distinguished historian of Spanish civilization, has given a searching and impartial analysis of the fundamental virtues and defects of the Spanish character and genius. Written, as he himself says, "in that terrible summer

of 1898, when such shame filled the hearts of all true patriots," the 'Psicología del Pueblo Español' (Madrid: Fernando Fé) is not untouched by the mingled impulses of patriotic indignation at the mistakes of the past, and a dignified hope for the future of the Spanish nation. Two extended chapters are devoted to the various opinions of the Spanish character held in all ages by the various peoples of Europe; a third discusses the present crisis and its remedies; and the final chapter considers the immediate possibilities of intellectual regeneration. The devastations of the Napoleonic wars were followed in Germany by a period of the very highest intellectual activity, and a similar fortune, Señor Altamira argues, is in store for Spain. The future of the country must depend on the energy, altruism, and far-sightedness of the "intellectuals," and it is to the moral mission of the university that the author devotes some of the most luminous and suggestive pages of this remarkable book. But to Americans, perhaps, the various passages which refer to American civilization will have the most interest. Scattered throughout the book, they speak quietly and impartially of the disillusion received by advanced Spanish minds during the progress of the late war, by reason of the defection of the young republic from her old ideals of peace and justice.

—In his 'Tale of Gyges and the King of Lydia,' reprinted from the *American Journal of Philology* of last year, Mr. Kirby Flower Smith attempts to reconstruct the legend of the Lydian adventurer Gyges from the five varying versions that have come down to us. We all know the story in Herodotus, the boastful folly of King Candaules, the reluctance of Gyges, and the vengeance of the queen who invites Gyges to slay her husband and become his successor, or himself be slain. Here is no mention of magic; but in the version in Plato's 'Republic' the point dwelt upon is the magic ring of invisibility possessed by Gyges, the earliest mention in literature of the magic ring that was to play so conspicuous a part in the "romans d'aventure." It will be remembered that in the Herodotean version the queen saw Gyges as he left her room by the door behind which Candaules had posted him. In a late, post-classical writer, Chennos, the queen's name is first given as Nysia, and it is said that she possessed a dragon-stone as well as a double pupil, which has a close connection with the "evil eye." Mr. Smith combines this passage with one that occurs still later, in Philostratus, to the effect that a dragon-stone "is invincible even against the ring of Gyges," and, by a careful comparison of all the references, constructs a version of the old popular folk tale. Gyges is the typical Adventurer of fairy tale, Candaules figures as the easily outwitted Giant, while his queen is the fairy Princess who possesses magic charms and plays the part of Medea in helping Gyges to a throne. If this is the correct version from which Herodotus and Plato made extracts, it is certainly singular that Herodotus should have omitted the picturesque details of the ring charm and the counter charm of the dragon-stone. Yet in the end it is on Herodotus that one must depend for the most complete rationalization of the story. Mr. Smith's reconstruction is, however, plausible enough, and in the course of it he collects a number of references which are useful illustrations of such points as the magic ring *motif* and the sources of folk lore and mythography.

RECENT BRITISH POETRY.

The University of Chicago has done a real service to literature by printing among its decennial publications the poems, once so famous, of Anne Countess of Winchelsea. This work is edited very skilfully by Myra Reynolds, of the English Department, and she has had the use, not only of Mr. Edmund Gosse's folio manuscript volume of the poems, but of other manuscripts from the present Earl of Winchelsea, who has also given her introductions by which it became possible to visit places associated with the author. As a result, many of these poems appear for the first time in this volume. The whole modern interest in Lady Winchelsea dates back to a well-known passage in Wordsworth's essays in which he says, writing in the year 1815, "It is remarkable that, excepting the 'Nocturnal Reverie' of Lady Winchelsea, and a passage or two in the 'Windsor Forest' of Pope, the poetry intervening between the publication of the 'Paradise Lost' and the 'Seasons' does not contain a single new image of external nature." Wordsworth had studied Lady Winchelsea's poems in manuscript and elsewhere. They were afterwards praised as warmly by Leigh Hunt and Christopher North. Mr. Gosse secured for these poems a place in Ward's "English Poets," and also discussed them, later, in his 'Gossip in a Library.' Mr. Saintsbury also, in his 'Short History of English Literature,' urged the importance of their republication in full, a desire not carried out, either in England or in America, until the production of this volume.

That the book is of much collective value cannot be claimed, but it is of great relative worth in showing the successive steps by which women made their way into English literature. When we consider that Dr. Johnson did not admit one woman among his fifty-two English poets, and Campbell only one among his one hundred and seventy, we can see the historic importance of Lady Winchelsea's productions. There is no doubt that her "Nocturnal Reverie" stands out among her poems as distinctly as Dr. Holmes's "Chambered Nautilus" detaches itself from the rest of his; but Wordsworth was quite right in finding it almost the only precursor in English poetry of his own out-door works. To appreciate it fully, one must recognize how rare during the whole period since Milton had been anything that could be in any degree classed with the Wordsworthian studies from nature. Take, for instance, the following passage (p. 269):

"When Odours, which declin'd repelling Day,
Thro' temp'rate Air uninterrupted stray;
When darken'd Groves their softest Shadows wear,
And falling Waters we distinctly hear;
When thro' the Gloom more venerable shows
Some ancient Fabrick, awful in Repose,
While Sunburnt Hills their swarthy Looks conceal,
And swelling Haycocks thicken up the Vale:
When the loos'd *Horse* now, as his Pasture leads,
Comes slowly grazing thro' th' adjoining Meads,
Whose stealing Pace, and lengthen'd Shade we fear,
Till torn up Forage in his Teeth we hear:
When nibbling *Sheep* at large pursue their Food,
And unmolested Kine rechew the Cud;
When *Curlews* cry beneath the Village-walls,
And to her straggling Brood the *Partridge* calls;
Their shortliv'd Jubilee the Creatures keep,
Which but endures, whilst Tyrant-*Man* do's sleep;
When a sedate Content the Spirit feels,
And no fierce Light disturb, whilst it reveals;
But silent Musings urge the Mind to seek
Something, too high for Syllables to speak;
Till the free Soul to a compos'dness charm'd,
Finding the Elements of Rage disarm'd,
O'er all below a solemn Quiet grown,
Joys in th' inferiour World, and thinks it like her Own:
In such a *Night* let Me abroad remain,
Till morning breaks, and All's confused again."

As an interesting commentary on this, we have in the preface to the present volume a full account of the production at Drury Lane theatre of a farce entitled "Three Hours After Marriage," which ran seven nights, and was then hissed off the stage. It was published under Gay's name, but Pope and Arbuthnot had also a hand in it. Of this farce Baker's 'Biographia Dramatica' says: "Phœbe Clinket was said to be intended for the Countess of Winchelsea, who was so much affected with the itch of versifying that she had implements of writing in every room in the house that she frequented" (p. lxiii.). We thus see that the first introduction of woman into the poetic art was accompanied by all the hostility and sarcasm which she has later encountered on the way to college education or the elective franchise.

The close of the Boer war deprives Mr. Henry Newbolt of much of his ammunition, and he turns to the middle ages and even to Omar for commonplace comfort, in his volume 'The Sailing of the Long-Ships, and Other Poems' (Appleton); but his whole vigor does not at once depart, and in these two verses he gives the old-time flavor of England and of home (p. 39):

OUTWARD BOUND.

Dear Earth, near Earth, the clay that made us men,
The land we sowed,
The hearth that glowed—
O Mother, must we bid farewell to thee?
Fast dawns the last dawn, and what shall comfort then
The lonely hearts that roam the outer sea?

Gray wakes the daybreak, the shivering sails are set,
To misty deeps
The channel sweeps—
O Mother, think on us who think on thee!
Earth-home, birth-home, with love remember yet
The sons in exile on the eternal sea.

Sir Rennell Rodd comes forth from his twenty years' banishment as secretary of legation in Egypt, and elsewhere, with a volume of poems, 'Myrtle and Oak' (Boston: Forbes), less ambitious in character than his youthful ones, but naturally somewhat more languid. His name still appears in 'Who's Who,' with the following item appended: "Recreations: tastes catholic, but especially fencing." The spirit of literary fencing which was once conspicuous has faded a good deal, and in a graceful poem, "In Chartres Cathedral" (p. 92), he shows catholic tastes in a higher sense. Yet it is perhaps creditable to him that his best poems are those inscribed to greater men than himself, Victor Hugo, Tennyson, and Browning; and his interpretations of Chopin and Wagner show a similar appreciative quality. It is to his credit that he selects for his memorial to Browning the sympathetic one on that poet's exquisite description of Guercino's "Angel at Fano" (p. 68):

Dearly-honored, great dead poet, still as living speak to me!
This is Fano, world-forgotten little Fano by the sea:

I have come to see that angel which Guercino dreamed and drew,
Since whate'er you loved and honored I would hold in honor too.

Like some sea-bird's nest the township clusters in its rampart wall—
Such a twinkling on the byways, such an autumn over all:

Gloomy streets with silent portals, all the pulse of life they hide
Throbbing toward that one piazza where it centres into pride;

House or palace, as their wont is in these Adriatic ports,

Turn their backs on darkling alleys and their faces
on the courts,

Courts beyond each tunnelled entrance, where,
through vaulted arches seen,
Glimpses flash of dancing sunlight, jets of foun-
tain, glint of green.

Here I found him, ever watchful for the work
of love to do,
That white-winged one whose great glory you
interpreted so true;

Still he folds the little fingers of that kneeling
child to prayer,
On the grave which tells the story why it needs
the angel's care;

Still above the forehead's glory arch the great
wings wide unfurled,
As alert to shield and succor all the orphans of
the world.

Of the 'Selected Poems' of William Watson (Lane), often arranged and rearranged in different editions, we may still retain a high opinion, yet without placing them quite so high as seems implied in so many reduplications. He is not dramatic, he is not fanciful, he has no background of humor, yet he has an earnestness, an elevation of tone which fix his hold in what he himself calls (p. 143) "immelodious days." He is capable, also, by sheer earnestness, of finding humble materials out of which to weave his song, as in this simple lay (p. 115):

FELICITY.

A squalid, hideous town, where streams run black
With vomit of a hundred roaring mills—
Hither occasion calls me; and ev'n here,
All in the sable reek that wantonly
Defames the sunlight and deflowers the morn,
One may at least surmise the sky still blue.
Ev'n here, the myriad slaves of the machine
Deem life a boon; and here, in days far sped,
I overheard a kind-eyed girl relate
To her companions, how a favouring chance
By some few shillings weekly had increased
The earnings of her household, and she said:
"So now we are happy, having all we wished."—
Felicity indeed! though more it lay
In wanting little than in winning all.

A precious historical document may yet be the little volume 'Songs of the Veld, and Other Poems,' reprinted from the *New Age* (London: New Age Press). The book opens with a list of subscribers, many of whom discreetly give their initials only; then follow many "Poems from Cape Town," mostly by a single writer who "prefers to remain anonymous"; followed by others from some forty different authors, often designated by initials, and including one American, Ernest Crosby. It also includes half a dozen poems on imperialism in the Philippines—half of them, at least, on Gen. Smith's detestable "howling wilderness" order—showing that sympathy for liberty is limited to no single direction. Much of the poetry, as is always the case with patriotic or liberty-loving strains, has more earnestness than true poetic flow in its expression. The general note is as in the following (p. 7):

A SONG OF FREEDOM.

Freedom spake to the Greeks of old
When the Persian hosts rolled on,
And their answer was stern Thermopylæ
And the plains of Marathon.
And Leonidas and his Spartan few
Still make us glow and thrill,
And the very name of Salamis
Can move us strangely still.

Freedom spake to the fierce old Scots
When bid to bow the knee,
And their answer was Bruce and Bannockburn,
And fighting from sea to sea.
And still the name of Wallace wight
And the death he died that day
Breathe upon Scotland the sacred light
That never fades away.

. . . . . .

Thus Freedom speaks to all and each,
And her touch is a touch of fire,
And the brave still listen with head erect
Though she points to block and pyre.
And their answer is still the prison's gloom,
And the battlefield's red gore,
And the name they hear of "Rebel!" "Fool!"
Which brave men ever bore.

And still they follow, Basuto, Finn,
Filipino, Zulu, Pole—
The Little Peoples of every race—
Her flying feet to the goal.
And lo! they follow, through blood and tears,
To that shining goal of the Free,
The lead of Him who died the death
Of a rebel, on Calvary!

'The House Building, and Other Poems,' by Marshall Bruce Williams (London: Johnson), rather confounds the critic by its absence of the orderly technical qualities so common in English verse, showing instead a tendency to that swelling rhetoric which is regarded by English readers as American. How America looks to the author's eyes is visible in such sonnets as that on page 81:

THE UNITED STATES.

Like a bold youth who only has been met,
In wrestling throws, by village boys at home;
And thinks that, once upon his feet well set,
His strength will serve to keep unharmed each
bone!
Yet knows not that when time and tide shall meet,
To launch him in the larger world without,
He'll find it difficult to keep his feet,
Unless he think as boldly as he shout:
So stands our cousin-land across the seas—
Full confident in number and in size,
That it will overcome the world with ease.
And make the old lands open wide their eyes!
But old eyes open quick these modern days:
The world's no child, still milking ancient ways,
But growing apace in power alike new worlds sur-
veys.

It will be seen that this progressive author quite discards, among other restraints, the Italian arrangement of sonnet rhymes, and equally, alas! the English standard in the rhymes themselves. We find, throughout, such rhymes as "tongue," "done" (p. 13); "repass" and "gas" (p. 21); "ideal" and "steel" (p. 25); "weary" and "descry" (p. 33); "contempt" and "sent" (p. 73), with many similar combinations. After all, poetry suffers from overearnestness, it may be, almost as much as from indifference.

'The Triumph of Love,' by Edmond Holmes (Lane), seems to involve no such contradiction in the title as did his previous volume, 'The Silence of Love: A Sonnet Sequence.' It seemed a sort of contradiction to imply that sonnets could sing silence and leave it silence still. But 'The Triumph of Love' has been sung measurably since sonnets were created, and though these are here Shaksperean in form—a form now well superseded by the Italian—the type of poetry still retains its charm, and this poet still handles it with a certain measure of skill. Yet the severe test of sixty-three sonnets tries an author's range and versatility very severely, and we find in these poems little or nothing of that extraordinary range of emotion and cadence which is to be found in Tennyson's "In Memoriam" alone. If there is, however, a climax, it is to be found in the very last sonnet of all, which is as follows (LXIII):

When, in the solemn stillness of the night,
My musing soul is filled with love of thee,
I seem to stand upon the world's last height,
The flaming rampart of all things that be.
And as I pause upon that lonely verge,
And plunge my gaze into the gulf below,
I see the cosmic billows sweep and surge
From death to life, with endless ebb and flow.
But howsoever deep my thought may sink
Into that well of darkness and of fire,
And howsoever deep my soul may drink
Of light and life and wonder and desire—
Love still remains—the love that thou hast waked—
Its deeps unfathomed and its thirst unslaked.

A new and more compact edition of 'The Bard of the Dimbovitza; Roumanian Folk Songs,' collected from the peasants by Hélène Vacaresco, and translated by Carmen Sylva and Alma Strettell, comes to us from Messrs. Scribner. The book is already a classic, and an addition to the romantic literature of the world. The poems are, as was well said by Frederick Harrison, "directly, passionately, fiercely human," and yet the touches of nature have wonderful wealth and intimacy. They have long since been analyzed and characterized in these columns. The new edition has the merit of being in one volume, and that of containing nine new poems, which fully sustain the naïve phrases and the simple and ardent emotion of the earlier lays. Like the others, the following has a prelude and finale, which often have no connection with the main song (p. 208):

QUESTIONS.

After the harvest, then the earth is weary,
And saith: "Till the next time of sowing, I am weary,
But when that comes, I shall grow young again."

"Sister, my little sister in the grave,
What tidings shall I give thee of the earth?"
"Tell me if thou hast finished 'broidering,
Sister, thy Sunday shift?"
"Already I have worn it at the dance,
Thinking the while of thee."
"And has the hay grown thick upon our meadow?"
"Last week we mowed it, and it has repaid
The kindly sunshine well;
I thought of thee while we were mowing it."
"Has mother a white pink beside our door?
That is my soul, that grows and blossoms there."
"Truth dost thou speak, the white pink is in
bloom,
And is thy soul;
When I breathe in its scent, I think of thee."
"Sister, now tell me, dost thou feel deep longing
After a husband's kiss?"
"Yea! Of themselves toward the little children
My arms reach forth;
And my womb chideth me, that I let tarry
Her fruitfulness so long;
She speaks: 'Give heed, for Life is hid in thee.'"
"Sister, then hast thou me no more remembered;
Oh, give me never tidings of the earth;
They do but think upon the future there."

After the harvest, then the earth is weary,
And saith: "Till the next time of sowing, I am weary,
But when that comes, I shall grow young again."

In 'Rainbows,' by Olive Custance (Lady Alfred Douglas) (Lane), we have a little volume singularly full, not so much of quotable poems as of quotable phrases, lines, rhymes, single combinations of phrase and description, as in the following (p. 24):

THE SONG.

Sing to me! for your songs drive care away,
And fill with delicate dreams the common day.
In music is your fettered self set free,
It is the unmasked man that speaks to me.
Gone is the cold bright glance I know so well,
Hushed is the hard light laughter like a bell;
Few would believe your smiling shallow eyes
Could swim and burn with such grave mysteries,
And few who know your clear, low voice, would
guess
That it could tremble with such tenderness.
Even your beauty and your pliant grace,
Transfigured by the passion in your face
Grow dim, like lamps at dawn, before the whole
Impulsive revelation of your soul.

Here what holds the eye and ear is the "cold bright glance," "hard light laughter," "smiling shallow eyes." These make us feel that we have seen the person; in other words, the description is alive. The book is dedicated to the Fairy Prince, and on the whole it tells secrets of which the reader wishes to hear more.

'Hand in Hand Verses,' by mother and daughter (Mathews), has in it thought and poetic feeling, with here and there a touch of East Indian flavor, such as often gives a foreign note to English verse; but all who love Landor will find most interest in the following (p. 75):

ROSE AYLMER'S GRAVE.

(Rose Aylmer died in Calcutta on March 2, 1800, and is buried in the old South Park Street Cemetery.)

An English grave 'neath Indian skies,
Marked by a sullen stone:
And this is where Rose Aylmer lies,
Far, flowerless, and alone.
Rose Aylmer was a poet's love,
Sweet, beautiful, and young.
Her elegy, in melody,
The poet-lover sung.

About her grave no flowers grow,
No pleasant boughs are stirred:
No gentle sun, no quiet snow,
No English bee or bird.
The suns of springtime scorch the stone,
In summer, storm and rave
The winds that herald the cyclone,
The rains that lash the grave.

Rose Aylmer's sister-flowers should spring
In whitest bloom above:
The roses Landor could not bring,
Far distant from his love.
But now a snake lies near her bed,
The crows perch on the rail,
A kite sweeps past, and overhead
The unclean vultures sail.

"Ah, what avails the sceptred race,
Ah, what the form divine!
What every vir-tue, every grace!
Rose Aylmer, all were thine.
Rose Aylmer, whom these wakeful eyes
May weep, but never see,
A night of memories and of sighs
I consecrate to thee."

Ah, why regret the gloomy hearse,
The land of banishment?
This is her grave; but Landor's verse
Rose Aylmer's monument.
Rose Aylmer, on thy namestone lies
Love's rose immortally,
The rose of memories and of sighs
Once consecrate to thee.

'Streamlets from the Fount of Poesy,' by N. B. Gazder, B.A., Barrister-at-Law (Leadenhall Press), is a singular outcome of the present condition of England. It rings on every page with "Britannia's triumph," even to rising, while speaking of British soldiers, to such curious climaxes as this (p. 3):

"Their brows are crowned with laurel wreaths,
Their praise is sung in lofty keys,
Their valour shines in mighty deeds
Which gain for them the grand V.C.s!"

The "Pax Britannica" is sung as ardently as if it were not a form of peace-making which devastates whole regions; and, to crown all, there is a religious and grateful poem with the peculiar title, "On the Declaration of Peace with the South African Republics," as if England had achieved any peace with them except by annihilating their existence so that there are no republics now left there. To retain the tradition, however, of the "Pax Britannica," the author writes verses on the death of President McKinley which, although they may possibly be charged with commonplaceness, as if subdued to what they worked in, show at least a friendly feeling.

'Tudor and Stuart Love Songs,' collected by J. Potter Briscoe, F.R.S.L. (Dutton), is one of a thousand collections of stray lyrics; and it is no better and no worse than many others. The editor speaks (p. vii.) of *William* Watson as one of the highest Elizabethan poets, when he means Thomas (p. 34); and in giving Imogen's Morning Song (p. 56), his line, "With everything that pretty is," forms but a poor substitute for the accustomed "pretty bin," besides the injury done through loss of the rhyme. 'All's Well: Being Optimistic Thoughts from the Writings of Robert Browning' (Bell), collected by Graham Hope, is an unusually good collection, and, from its very optimism, suits Browning better than most books of the kind. 'Fulbeck: A Pastoral,' by J. Walter West, A.R.W.S. (Bell), with illustrations by the author, is in itself brief, and not of much value, except that, both to the eye and the ear, it suggests happy old-time associations of English rural life.

Mr. Frederick York Powell publishes 'Quatrains from Omar Khayyám Done into English' (Oxford: Bell), some twenty-four in all. The translation is made, not from the original, but from the English version of Mr. Justin H. McCarthy and from the French version of M. Nicholas. The highest compliment that can be paid to FitzGerald is in the shoal of commonplace versions from Omar which have followed his marvellous bit of work. But Mr. Powell disarms us by writing of his own productions, "They only hope to be considered humble appendices to the rendering of Omar by FitzGerald, for verily, as Hárith sang of Amru long ago (p. 18):

"He is a king that hath brought all under his subjection,
Nor is there among them his peer in his gifts."

GENERAL GREENE IN SOUTH CAROLINA.—II.

The History of South Carolina in the Revolution, 1780-1783. Volume IV. and last. By Edward McCrady. Macmillan. 1902. Pp. xxvii., 787.

Greene's military operations in the South are traced by Mr. McCrady with great minuteness, and in general in the same depreciatory spirit that characterizes his treatment of Greene's relations with the partisan leaders. Greene's repeated defeats are critically dwelt upon, while the broader outlines of his movements, in which, though losing the battle, he gains the principal advantage of the campaign, are largely obscured by the mass of incident. It is, indeed, a characteristic of all of McCrady's volumes that their wealth of detail makes it difficult at times to tell just what the story is all about. No one, for example, would be likely to get from the volume before us any clear understanding of that masterly retreat across the Carolinas which did so much to give brilliancy and permanence to Greene's military fame.

In opposition to Ramsay and Johnson, Mr. McCrady is of the opinion that the victory at Cowpens, though resulting in "the destruction of the best regiment in the British service, the loss to it of some others of their best troops, and the end put to the terror of Tarleton," had "no decisive effect upon the opening campaign," and was "much nearer the end of the chain of causes which led to the redemption of these States than to its beginning" (pp. 54, 55). For Morgan's justification of his position at that battle he has unmeasured denunciation. We are not clear as to the grounds for the positive assertion that Greene's position at Cheraw "did not compel Cornwallis to divide his forces." With both his flanks threatened by Greene, Cornwallis had detached Tarleton in pursuit of Morgan, and sent Leslie by way of the Wateree to Camden. Greene's conduct, which Mr. McCrady strongly condemns, in leaving the main army and going with a small guard across the country to join Morgan, is explicable on the assumption that Greene hoped to make the victory at Cowpens a means of assuming the offensive in that quarter, and checking Cornwallis's advance towards Virginia. The movement was unsuccessful, but it is hard to see why Greene should not have attempted it; while the slow movements of Cornwallis, to which, in Mr. McCrady's opinion, Greene's escape was wholly due, rather show that the British commander was left very much in doubt as to how to act. Mr. McCrady's animus, however, is not far to seek. With the withdrawal of the main body of the Americans under Huger, "South Carolina was again abandoned by the Continental army" (pp. 94, 95). Plainly, any plan of campaign which took the Continental troops, relatively inefficient as we are repeatedly told they were, out of the State, had something radically defective about it.

Mr. McCrady agrees with Johnson in acquitting Greene of blame for the sudden attack at Hobkirk's Hill, but cannot understand upon what ground he had expected victory, since his only advantage over the British was in the possession of three pieces of artillery. The campaign, as a whole, he "rather followed than led" (p. 343). For Greene's course at Ninety-six Mr. McCrady has little praise; in his view, Greene should not have turned aside to besiege this post, and ought to have known beforehand of its strength.

It was Greene's misfortune to lose his most important engagements, and although Washington had only praise for what was accomplished, the repeated defeats were bitter disappointments to Greene. Here again, of course, Mr. McCrady finds a weak spot in the armor of this, to him, much overrated hero. Greene, we are told, was always finding some one else on whom to lay the blame for his reverses. At Guilford it was the North Carolina militia, whose inefficiency Greene had denounced in plain terms to Sumter. At Hobkirk's Hill it was Col. Gunby and the First Maryland Regiment. In the latter instance a court of inquiry only confirmed Greene's opinion, but Mr. McCrady thinks Greene's assertion "mere presumption," and that defeat might with as much reason be ascribed to Col. Washington's raid into the British camp, or, indeed, to Greene's own "mismanagement, by which, in advancing his centre, he covered his artillery so completely as to silence it, while, attempting to assail both flanks of the enemy, he exposed his own wings to a like danger" (p. 199). The charge that Sumter's absence was to blame for the disaster is examined at length, with the conclusion that Sumter was only obeying Greene's orders. At Ninety-six, again, Greene had "his usual consolation," this time in the failure of the Virginia militia to join him; while at Eutaw it was (to quote Greene's own words) "one of those incidents to which military operations are subject"—the incident in this case being "the want of discipline in his Continentals, who broke their ranks to secure the spoils of the enemy's camp" (p. 462). We have only to observe in this connection that, with the exception of the blame attached to Sumter for his absence at Hobkirk's Hill, Mr. McCrady appears not to have shown that Greene's explanations were not the true ones, or that, as an officer of the army, bound to report truthfully to his superior, he had any alternative but to state the facts as he saw and understood them. It would be a curious canon of military criticism that would disparage an officer whose defeat was primarily due to the misconduct of some one else.

But Mr. McCrady brings what he evidently regards as a still more serious charge against Greene, namely, a purpose to abandon the South to the British and to return to Virginia, where there would be more opportunity for personal distinction. On the much debated question of the responsibility for Greene's course after the battle of Guilford, Mr. McCrady takes, as usual, ground sharply adverse to Greene. In opposition to Johnson, he affirms that the plan of returning to South Carolina did not originate with Greene, but with Lee, and that, while adopting it, he did not "cordially approve or warmly enter into it" (p. 160).

"Indeed," he adds, "a want of final decision seems to have been one of the defects of his mind; he could never altogether help hankering after the rejected alternative; and so it was that, throughout the ensuing campaign, we shall find him turning to and longing for the field of Virginia as the proper sphere of operations for the commander of the Southern Department" (p. 161).

With his first reverse, Greene returns

to the Virginia plan, and writes to Lee that he thinks his duty calls him in that direction. This letter of May 9, 1781, already public in Lee's 'Campaigns in the Carolinas,' is given by Mr. McCrady the least liberal or generous construction. Greene is represented as meditating the abandonment of the South and retirement to Virginia, not because his presence was more needed in the latter quarter, but because his present service was uncongenial, and Virginia held out a prospect of personal distinction. Again we must dissent, not from the facts, but from the conclusion. Important as it was for South Carolina that the progress of the British in the State should not go unchecked, it was nevertheless obvious that the safety and independence of the State, as well as the safety and independence of North Carolina and Georgia, depended on the maintenance of communication with Virginia. No graver danger threatened Greene, particularly in the first months of his command, than that Cornwallis, eluding him, might get between Virginia and the American army and cut off all possibility of succor. It seems, therefore, a wise military instinct, rather than a venting of personal chagrin or craving for personal distinction, that led Greene to consider whether his place was not, after all, at the point where lay the greatest danger to the independence of the entire South. That Greene found campaigning in the swamps of Carolina an "uncongenial service," and would have been glad of as much personal distinction as he could properly attain, is as natural as that he should have had little confidence in the power of partisan warfare to rid the country of the British army; but as Commander of the Southern Department—a high-sounding title which seems to disturb Mr. McCrady—he was bound to survey the whole field, and entitled, also, to be himself at the place where, in his judgment, he was most needed.

So far as South Carolina was concerned, its political representatives seem to have been strangely insensible, during the active period of the war, to Greene's incompetency and vacillation. Gov. Rutledge's praise of Greene was echoed by the Jacksonborough Assembly, whose Senate concurred "most sincerely" with the Governor "in acknowledging and applauding the meritorious zeal and the very important services" of "the great and gallant General Greene." The House, in addition to extravagant eulogy of Greene, declared Sumter, Marion, and Pickens "deserving of the highest commendation"; but Mr. McCrady conjectures that it was the "modesty and delicacy" of Sumter and Marion, both of whom were present, that "excluded from the proceedings of the Senate any recognition of the great services they had rendered (pp. 568, 569). He doubts, also, whether the Assembly would have been so eager to testify to their admiration for Greene by purchasing an estate for him had they known that his return to the State "had not been of his own suggestion, and that he had unwillingly remained in the State after coming," or had the partisan leaders been aware that he "had sneered at and belittled their services" (p. 574). Again it was Sumter and Marion who, though sitting by, were "too high-minded to challenge" this undeserved praise.

Greene's relations with the State Government did not continue always so happy. The Assembly, in attempting to provide a system of supply, had forbidden impressment. The whole Continental line was "in a deplorable state for the want of clothing and other necessaries" (p. 619), while a spirit of unrest and insubordination was widespread. The "decisive conduct" of Greene quelled the mutiny, though Mr. McCrady, sure of finding something to complain of in the conduct of the Continental troops, reproaches them for declining to be satisfied with so "substantial and nutritious" a food as rice, which any soldiers not "pampered" would eat rather than mutiny. The controversy between Greene and Governor Mathews over the former's decision to claim on behalf of Congress certain horses, the property of citizens of South Carolina, recovered from the British by Kosciuszko, and between Greene and Governor Guerard over the reception of a Spanish flag, are treated by Mr. McCrady with his usual sneer at Greene's legal attainments and dictatorial ways. After the evacuation of Charleston by the British, Greene had the difficulties which often beset the commander of a victorious army in the interval between the cessation of hostilities and the definitive conclusion of peace. Solicitous over the supplies for the army, he took the liberty of addressing the Assembly on the subject —"most officiously," says Mr. McCrady—urging "the great necessities of Congress, the little to be apprehended from its powers, the injustice that had been done the army, its mutinous temper, the withering state of the treasury, and the imperious [*sic*] duty of enabling the general Government to fulfil its contracts" (pp. 688, 689). The Assembly, little interested in Congress, impatient at the presence of the army, and bent upon the rehabilitation of the State after the disastrous years of war, took deep offence, and was little appeased by a second letter in which Greene tried to smooth the matter over.

We have no space in which to follow Mr. McCrady in his account of Greene's connection with the firm of Banks & Co. It was an unfortunate transaction, ruining Greene's finances and clouding all his later days, and for it he is to be at least as much pitied as blamed. Mr. McCrady gives a clear and detailed account of the matter, with a degree of fairness to Greene much in contrast to his generally hostile attitude. Nor can we examine the many other interesting events in the history of South Carolina in the short period from 1780 to 1783, and note the criticisms of men, occurrences, and motives with which Mr. McCrady's pages are studded. We must take leave of the work with one or two summary statements.

The four volumes of Mr. McCrady's History of South Carolina unquestionably form one of the most valuable contributions to State history, and incidentally to the history of the United States, that have been made in recent years. References to manuscript sources are few, but the printed authorities have evidently been painstakingly examined. To be sure, if the history of every important State is to be written on a similar scale, the study of American annals may well become impracticable for any one who lacks abundant leisure, patience, and enthusiasm; but the larger part of Mr. McCrady's material is certainly of more than local interest. But, for the spirit in which the latter portion of the work has in large measure been carried out, there can be only reprobation. Ample as his equipment of knowledge undeniably is, one puts down Mr. McCrady's final volume with the uncomfortable feeling that the author is first a South Carolinian and second an historian. Jealous regard for his State, thick-and-thin admiration for Sumter and the other partisan leaders, contempt for Congress and the Continental army, and something strongly suggestive of hatred for Greene—these are the impressions which fix themselves most firmly as one reads on through Mr. McCrady's pages. That he has corrected many an error, dissipated more than one illusion, and revealed the weaknesses and inconsistencies of more than one prominent figure, must be admitted. The material for a life of Greene will be used all the better by some future biographer because of the critical and merciless examination to which it has here been subjected. But, from its lack of sober, unbiassed judgment and impartial analysis of motives, Mr. McCrady's great work fails, in its conclusion, at the very points at which an historical work ought to attain success. It offers a profusion of facts, but it breathes no true historical spirit. The voice is Jacob's voice, but the hands are the hands of Esau.

Literary Landmarks of Oxford. By Laurence Hutton. Charles Scribner's Sons.

This volume is dedicated to Dr. Patton, late President of Princeton, and is avowedly compiled "for the benefit of the general reading public and of the college men of to-day on the Western side of the Atlantic." Its object is to fill a gap which Mr. Hutton has discovered in Oxford college histories; they devote pages to founders, to prelates, and to politicians, but ignore the literary associations of the University. He deals with his subject in the alphabetical order of colleges, excluding living writers from his consideration.

The result is a piece of book-making which, in spite of its pretensions to learning and accuracy, is of a scandalous slovenliness. The author tells us that he has consulted hundreds of volumes, and that what he has learnt he has set down "patiently, carefully, and, he thinks, correctly." Actually, the book is thick with errors, many of which might have been corrected by the use of the commonest books of reference. The current University Calendar would have warned him against "Christ Church College" and "Brazenose." It would also have prevented him from printing the name of the Rector of Lincoln (Dr. Merry) as "Murray," and that of the Warden of Merton (Mr. Brodrick) as "Broderick"—thus misspelling the names of two out of the three living heads of houses whom he happens to mention. What would be thought of a writer on American colleges who, while making a boast of his accuracy, referred to Dr. Elliott of Harvard and Dr. Hadleigh of Yale? It appears from two distinct passages that Mr. Hutton is not even aware of the difference between a scholarship and a fellowship (pp. 42 and 116). He connects Magdalen Hall with Magdalen instead of with Hertford, there-

by reviving claims which everybody supposed had been finally disposed of by the Court of Common Pleas in 1694. Mr. Hutton explains that he does this "to make the confusion less confounded," though there is no confusion whatever in the matter to any one who will read the college histories. Clough did not gain the Rugby Balliol Scholarship (p. 44), for there is not and never has been any such thing. Dr. Routh was not a master of Magdalen College School (p. 149), but President of Magdalen College. Mr. Hutton reports a conversation between Swift and Dryden held as late as 1792 (p. 111), and repeats the same date as the year in which Swift received his degree. These are among the errors that strike the eye; one wonders what discoveries would be made by attempting to verify the dates and names page after page.

The author's choice of persons to write about throws significant light upon his knowledge both of English literature and of Oxford. If there is one name in English literature more closely associated with Oxford than any other it is that of Clarendon, from the profits of whose 'History' the Clarendon Press was established. But Mr. Hutton cannot spare a line for him, though he can afford nearly four pages for "Verdant Green." He complains that college histories dwell upon the men who made history rather than upon those who wrote it, yet for himself he ignores not only Clarendon, but Hallam, Gardiner, and Stubbs. His chapter on Christ Church, presumably, would have been overcrowded by a notice of these eminent sons of hers, as it was necessary, at all costs, that it should give a page to C. L. Dodgson. Mr. Hutton's account of Magdalen Hall recognizes Samuel Daniel, but ignores Thomas Hobbes. In writing of Oriel, he mentions Keble and Thomas Arnold, but omits Whately, the Mozley brothers, and Church. Bishop Butler is also forgotten in the chapter on this college. Mr. Hutton was shocked to find that, forty years after J. R. Green had left Jesus College, there was a college servant there who had never heard his name, but there is no evidence that he has himself ever heard the name of T. H. Green. During the nineteenth century there was no more distinctively Oxford man of letters than Mark Pattison, but he, too, is not important enough to figure in this collection. As Mr. Hutton admits Conington (whom, of course, he calls Connington) by virtue of his edition of Virgil, and Liddell and Scott by virtue of their lexicon, he would seem to regard distinction in classical scholarship as a title to mention, but Liddell's great predecessor Gaisford is entirely overlooked.

Being so imperfectly equipped with material for a book on his professed subject, Mr. Hutton was driven to seek padding outside it. He has, therefore, filled page after page with miscellaneous gossip about earlier Oxford customs, and stories of the university life of a few centuries ago, quite irrespective of any literary associations. Three times, for instance (pp. 15, 31, and 180), he notes with interest the small cost of meals in former times. To bring his book still nearer perfection, he bedews it with humor which would excellently serve the purpose of the funny man of a Sunday paper. And having completed this masterpiece, he writes an introduction in which he rebukes the Oxford of to-day for her indifference to, and lack of knowledge of, her past history, and suggests that a volume might be written on "What Oxford Does Not Know about Oxford!"

But this amazing production offers two compensations. Firstly, any subsequent writer on the Literary Landmarks of Oxford will find in it valuable material respecting Mr. Hutton's own connection with the place. He will learn, for instance, that Mr. Hutton's investigations were conducted during a visit of six weeks (p. 3); that he dreamed about Oxford every night during his visit (p. 37); that any baldness visible in him—there is reason for suspecting that a joke is intended here—is due to a disappointment about the identification of Hooker's rooms (p. 87); that he wrote most of this book in a house once occupied by Max Müller (p. 151); and that on several summer afternoons he talked cat-talk to the descendants of Tom Brown's College Toms at Oriel (p. 185). Secondly, the thirteen drawings by Herbert Railton, with which the book is illustrated, are exquisite. They afford a convincing plea for Grangerism, for no one could possibly be blamed for extracting them and pasting them into some book worth keeping. In spite of these compensations, however, the college man in America, whether likely to be a candidate for the Rhodes scholarships or not, would be better advised to try one of the sixpenny guide books.

The Characters of Theophrastus. Translated by C. E. Bennett and W. N. Hammond. Longmans. 1903.

The standard English translation of the 'Characters' is that published by Sir Richard Jebb in 1870, but it is unfortunately out of print, and meanwhile the version of Messrs. Bennett and Hammond is a very fair temporary substitute. Theophrastus was, like his master Aristotle, a savant, and stands outside the pale of pure literature. But Aristotle's 'Poetics,' in spite of its form, became the canon for the composition of tragedy, and so these slight character sketches by the Lesbian naturalist take a by no means insignificant place and represent a definite tendency in the literature of their age. The theory mentioned in the introduction of the latest translators, that Theophrastus influenced Menander, is probably unsound. It is more likely that the 'Characters' echoes the work of the "star of the new Comedy," the poet who hit off every human type—*omnem vitæ imaginem expressit*—who is the true representative of the Comedy that replaced political satire with the psychological study of manners. In the seventeenth century, Theophrastus inspired La Bruyère to translate and imitate him; but while the Greek had drawn the man whom one may meet any day in any century, the Frenchman was more personal and less philosophic. And so, though he covered far more ground than the narrow field of human defects recorded by Theophrastus, he is already less interesting and even less read. From La Bruyère's studies of character, though he scorned the imputation that he wrote maxims, one could make a very good anthology in the style of La Rochefoucauld and so extract the best of him; for we take no interest nowadays in trying to identify *Théodecte* the noisy diner-out, or *Cléon* or *Cléante*. But Theophrastus must be read intact. He did not go so deep into the human heart, but what he saw was the essential. We have all met his exquisite:

"He makes few purchases for himself, but sends presents to his friends at Byzantium, and Spartan dogs to Cyzicus, and Hymettian honey to Rhodes; and when he does these things he tells it about the town. Naturally, his taste runs to pet monkeys, parrots, Sicilian doves, gazelles' knuckle-bones, Thurian jars, crooked canes from Sparta, hangings inwrought with Persian figures, a wrestling ring sprinkled with sand, and a tennis-court. He goes around and offers this arena to philosophers, sophists, fighters, and musicians, for their exhibitions; and at the performances he himself comes in last of all, that the spectators may say to one another, 'That's the gentleman to whom the place belongs.'"

Or the stupid man:

"When he goes to receive payment of a debt, he takes witnesses with him. In the winter season he quarrels with his slave because cucumbers have not been provided. He forces his children to wrestle and to run until they fall into a fever. When he is roughing it in the country and himself cooks the vegetables, he puts salt in the pot twice and so makes the dish impossible. When it rains and others declare that the sky is darker than pitch, he exclaims: 'How sweet it is to consider the stars!' And if he is asked 'What is the mortality of the city—how many bodies have passed through the Sacred Gates?' he replies: 'Would that you and I had as many!'"

In these sketches Theophrastus appears to be a humorist with an eye on defects rather than vices, as we should use the term. But the Greeks had not learned to distinguish so broadly between ethics and æsthetics; to them, stupidity, talkativeness, impudence, and pompousness ranked with the vices, and Theophrastus wrote his 'Characters' as a study in ethics in which one may trace the influence of Aristotle as well as of the new Comedy. His Greek style gains by translation; the rendering of the present translators is faithful, and the introduction sufficient. English readers, therefore, who have not access to Professor Jebb's version, may well be grateful for this pleasing little volume.

The Battle with the Slum. By Jacob A. Riis. Illustrated. New York: The Macmillan Co. 1902.

This book would have attracted more attention than it has, but for the fact that most, if not all, of it is a republication. After writing 'How the Other Half Lives,' the author published, three years ago, 'A Ten Years' War,' a series of papers intended to account for the progress of "the battle with the slum" since the first volume appeared. Since that time, as he hints in his preface, a good many things have happened, and he has been occupied, not only in the conflict itself, but incidentally in writing about it. In the present volume he has passed the later stages of the conflict in review, "retaining all that still applied of the old volume and adding as much more." The "stories" are reprinted from the *Century*, and these, he adds, are fact, not fiction. The volume is copiously illustrated, and has plenty of real interest without the pictures.

This interest centres about two points: first, the author, and, secondly, what it is the fashion to call the "point of view" of the cause he advocates. Mr. Riis is, of course, an enthusiast, and in his enthusiasm fails to see that a much more restrained way of writing would be more effective for

his purposes than that which he employs. But his enthusiasm is genuine, and carries conviction. He is so evidently honest in his sympathy for human suffering and ignorance, and even for human perversity—his character shines so transparently through what he says—that the most critical (or, as he would say, most pessimistic) nature is forced first to attend and then to follow. "What the Fight is About," the first half-dozen pages of the book, sums up its whole theory. This theory, to put it in our own words, is that the slum is the measure of civilization. So far from its being tolerable, as those who went before thought, that squalor and filth and vice and crime should exist in great masses and plague-spots, side by side with wealth and education and order and happiness, the new theory is that, in a civilized community, the slum has no business to exist at all; that it can be extirpated, and that if it is not extirpated, the crime lies at the door of the prosperous classes who suffer it to go on. Now when we look at the slums of New York, we look at the worst case in point in the world, for here the slums have been permitted not only to fester and breed their kind, but to give a government to the city. Tammany, which thirty years ago meant only robbery, came in a generation to mean a government devoted to the propagation of vice and crime for private gain—probably the nearest approach to a "hell on earth" yet seen. Even Tammany never quite attained its ideal, but it came near enough to show us that it would have included, when perfect, a police dedicated to the work of deriving a revenue from the licensing not merely of bawds and pimps, but robbers and murderers; a fire department conniving in the work of the police by the spread of fires; a health board propagating disease; a building department aiding the main purpose of the government by selling licenses to violate the laws designed to secure life and limb and prevent the spread of pestilence—all directed to pouring a stream of money into the pocket of the man who managed the ingenious machinery by which he enslaved, plundered, and debauched his principality.

This system it is which has produced the New York pessimist for whom Mr. Riis has so little sympathy; fortunate for us if it has produced enthusiasts like Mr. Riis, who, seeing, as he says, that "we win or we perish," is ready for the battle. His battle with the slum is really only another side of the struggle for good government in which even "pessimists" now know they must take part or perish. Everybody cannot be an enthusiast; but everybody feels the force of inspiration, and Mr. Riis is inspired by that sympathy for the poor and weak and unsuccessful which drives men, not to alms-giving or psalm-singing, but to daily action against evil and its causes. The motive to which he appeals is in the end religious:

"We shall win, for we are not letting things be, the way our fathers did. But it will be a running fight, and it is not going to be won in two years, or in ten, or in twenty. For all that, we must keep on fighting, content if in our time we avert the punishment that waits upon the third and the fourth generation of those who forget the brotherhood. As a man does in dealing with his brother, so it is the way of God that his children shall reap, that through toil and tears we may make out the lesson which sums up all the commandments and alone can make the earth fit for the kingdom that is to come."

Biographic Clinics. By George M. Gould, M.D. Philadelphia: P. Blakiston's Son & Co.

That curious nervous function which the physiologists call reflex action, illustrated when the pupil contracts under glare, the cheek flushes in anger or pales in fear, the mouth waters in anticipation of food or is parched under a test for guilt, is absolutely independent of the will and usually does not arouse sensation. Reflex action may also be potent as a cause of distress, with effects equivalent to disease, but without sensation in the part directly at fault. Nicotine poisoning is not painful to the nerves supplying the heart, but, when it weakens their control, that organ palpitates or intermits in its pulsations. Vision has been completely lost, without ocular pain, by reflex action from obscure dental conditions, to be restored simply by the removal of the distant cause. The range and list may be greatly extended.

Resting on this recognized foundation, Dr. Gould analyzes the notorious ill-health of five well-known literary men—De Quincey, Carlyle, Darwin, Huxley, Browning—and in each instance attributes the physical prostration to unconscious errors of vision, leading to profound reflex action, for whose existence he finds internal evidence in their published lives. The contention is very plausible in each case. From that text he argues with force and feeling that eye-strain is crippling multitudes with its unrecognized power. The primary defect does not lie in the nervous system. It depends upon aberrations of the refracting apparatus from the normal, often involving not more than a few thousandths of an inch in radii and curves. These trifles acquire their importance from the infinite repetition of infinitesimal stimuli of light rays upon the retina, each stroke distorted by the mechanical errors in the transmitting, not the receiving, equipment. The mischief follows the involuntary effort to correct these errors and to work with imperfect tools. The condition is parasitic to civilization. It is the man absorbed in near work who uses his eyes in ways, one is disposed to say, foreign to their design. Certainly savages, plainsmen, sailors, the men whose requirements are for long-range vision, are not those who fall back on spectacles.

The actual harm occurs in many and unsuspected ways. Headache, pain near the shoulder-blade, nausea, are common enough. Subjective sounds, want of mental concentration, vertigo, a nameless horror of places and conditions—in short, general wretchedness — are less common, but are frequent. Beyond all these, it is entirely conceivable that the nervous disturbances set in train may ultimately, by inhibition in some directions and overstimulation in others, originate disorders of digestion and nutrition, which, as Dr. Gould truly says, "are direct or secondary sources of a large part of the functional diseases and misery of the world." Glasses will not rejuvenate age, but in more cases than are suspected they will remove numerous and most trying infirmities of body and irritability of mind—that is to say, properly adjusted glasses. If Carlyle's physicians only knew!

The Roll-Call of Westminster Abbey. By Mrs. A. Murray Smith (E. T. Bradley). With illustrations and plans. The Macmillan Co. 1902. Pp. x, 418.

Mrs. Smith has given special attention to Westminster Abbey and its memorials. Her 'Deanery Guide,' published in 1885, "has passed through twelve editions and has been constantly revised"; but it appears that it is now as large as it can be, and that the special coronation number will give it its final form. 'The Annals of Westminster Abbey' is also hers. We do not remember to have seen it, but it is spoken of in the preface now before us as rather a large work—much larger, for instance, than the present volume. The remarkable interest which English people of some scholarly habit take in Westminster Abbey, as forming, with its adjuncts and its contents, the embodiment of their national or at least their regal history, is the explanation of a perfect shower of publications of different sizes, of varying cost, but all prepared for the same class of visitors or sightseers, under the same semi-historic, semi-romantic influence.

The world of readers of English books thinks of England as that nation which, most of all in Europe, has continued to care for its historical traditions, retaining as it does mediæval features in its legislature, and mediæval ceremonies in the appointment and inauguration of its officials; but on examination it is found that there is much more of this conservatism in appearance than in reality. The one way in which this book may be useful to the historical student, is in pointing out the lack, even in England, of complete adherence to the conservative way of guiding a nation. One who turns these pages will see very frequent allusions to the spoliation by higher authority, to the plundering by unauthorized knaves, to the changes wrought by unworthy "restorers," to the blundering administration of careless or uninformed directors. The royal tomb is there, perhaps, but it has been opened more than once, and on each occasion some part of its contents has been removed; those very objects, so abstracted from the tomb in which they were to have remained until the day of judgment, have again disappeared, sold or pledged by necessitous monarchs, or simply appropriated by palace officials. And then, although there is indeed in England that spirit of continuity for which we give the English people so much credit, it has failed to act on many occasions when the indifference of a single official during his brief term of office has caused losses, and even more frequently changes, which it was impossible afterwards to replace or remedy.

The photographs given in this volume, twenty-five full-page plates, go far to illustrate this mingling or alternation of preservation and destruction, of care for the historical relic and of indifferent utilizing of it for immediate profit or convenience. The tombs, preserved in part but in new situations; the architecture, still there, but modified by restoration or by unrepaired destruction; the royal effigies, with their record of admitted importance, at one time so completely forgotten that their place of deposit was known to but a few custodians, and their exposure now to a public which, so far as it is careless,

laughs at their unsightly oddity, and, so far as it is studious, is annoyed by their dubious condition of frequent repair and modification—are all suggested by these illustrations, though, of course, the explanation given in the text is needed to make the truth obvious.

It is probable that that text is trustworthy. It consists of so great a number of studies in semi-historical legend that it must have required the half a lifetime which Mrs. Smith seems to have spent upon the subject to accumulate and arrange so large a collection of bits of information. And who is there who can check such a series of statements? It is not history, for there are no statements of general tendency, of gradual development, whether of the life of the community or of the governmental institutions of the country; and it is not merely legend, because the stories are not told merely as stories. Thus, in the case of Edward III. and his queen Philippa, there is much said of Froissart's view of the Queen, and Froissart is named as "her friend and faithful secretary"; and there is much about the tomb which Edward erected in the Abbey to her memory, and about the thirty little figures of mourners of whom all but two had disappeared when Sir George Gilbert Scott began his rather elaborate restorations of parts of the Abbey, some thirty years ago, while only one is to be found now; and there is something about so much as remains of the iron grille with its figures, and the wooden canopy with its decorations. The story goes on to tell in a quasi-historical way of the death of Edward, and the quarrels and the civil war which were to follow. With the next chapter this story begins again with the details of Richard II.'s life and actions; and his half-legendary history, with all its doubts and uncertainties and contrary allegations, is treated in a chapter (pp. 45-55), in which there is almost nothing about the Abbey or its contents—only mention of that tomb which Richard erected to his first queen, but from which the recumbent figures have disappeared; and of that other monument, the well-known painting so often reproduced as one of the few authentic and artistically valuable portraits of so early an epoch.

To pass over centuries, and to open the book quite casually at page 344, is to find ourselves amid the memorials of two unlucky campaigners in America, Major André and John Burgoyne, and associated with them some men of less fame who were also known at one time as soldiers in Great Britain's American possessions, as they then were—Enoch Markham and Sir Archibald Campbell. No possible artistic interest attaches to such memorials of these men as still exist, but it would appear that their somewhat romantic history is a part of the "Roll-Call of the Abbey." Indeed, the next chapter is devoted to the makers of the British-Indian Empire, and the final chapter (pp. 383-404), deals with literary men, theologians, and even men of science and of affairs whose tombs are enclosed within the Abbey walls. It is quite evident that the attempt to make a continuous narrative of all this, and to invest it with a sentiment half-patriotic, half-romantic, is so far an injury to the book, considered as a record, that one is never certain as he reads where the ascertained facts end and the author's imaginative treatment begins. There is, however, an index, limited, indeed, to proper names, and therefore excluding incidents or events, but still perhaps to be thought sufficient for a "Roll-Call."

Tracts Relating to the Currency of Massachusetts Bay, 1682-1720. Edited by Andrew McFarland Davis. Boston: Houghton, Mifflin & Co. 1902.

This is a collection of tracts supplementary to Mr. Davis's important work in two volumes on 'Currency and Banking in the Province of Massachusetts Bay,' published two years since by the American Economic Association and reviewed at length in these columns. It embraces the text of some of the original matter by means of which students are enabled to trace the evolution of the prevailing theory of money and exchange in the New England colonies. It consists mainly of statutes and pamphlets, the latter now of extreme rarity and much scattered. Of some, only a single copy is known to exist. Mr. Davis aims to put all of them within easy reach of students. How great a service this will be, only those can understand who have attempted to find even a small part of them. Mr. Davis's success in bringing out future volumes will depend in part on the public demand for the present one, which contains eighteen pamphlets, embraced in 394 pages. The peculiarities of spelling and of capital letters and italics in the original are followed, and the paging of the old pamphlets is indicated. There is also a facsimile of one page of each.

The first of the series, entitled "Severals Relating to the Fund," is the oldest. Only one copy of this is known. It is in the Watkinson Library at Hartford. The late J. Hammond Trumbull established the date of publication as March, 1681, and identified the author with the Rev. John Woodbridge of Newbury, Mass. The Fund here contemplated was "a Fund of Land . . . in the nature of a Money Bank or Merchandise-Lumber" (*i. e.*, Lombard), based upon land. It is the first outline that has come down to us of the theory of land-banking that was afterwards put in practice in some of the New England colonies, and later in the Southern and Southwestern States of the Union, in each case disastrously. Mr. Davis has shown, in his second volume, how this conception of banking was derived by an illogical process from the example of the Bank of Amsterdam, which was itself not based on land, but on bullion, and was successful for that reason. "Severals Relating to the Fund" has several imitators in the volume before us, in which it is interesting to trace the growth and spread of the fallacy that ultimate security for payment can be made to answer the same purpose as immediate cash payment in establishing a bank.

"Some Proposals to Benefit the Province" is the theme of the last tract in the collection. It bears date 1720. The benefit proposed to the Province was to be a bank owned by the state, to issue bills to be loaned upon improved lands, "or any sufficient security," for twenty-one years at 6 per cent. per annum, payable in hemp, flax, turpentine, pitch, tar, resin, fish, oil, whalebone, "or any other specie that will prevent importation, or that is good for exportation." These articles were "to be stored up in the Lumberhouse," which was a part of the bank, and in due time to be exported to the "Streights" and sold for bullion, which should be brought back and lodged in the bank. In this way it was reckoned that in twenty-one years the whole bank stock would be converted into bullion, with which the bills might be redeemed. Then the debt of the borrower was to be cancelled without other payment. The benefits of this scheme to the borrowers were too obvious to need demonstration, but the author figured out a profit also to the state of no less than £928,700, if 2,000 farmers should take out bills to the extent of £100 each. This curious plan was never put in practice, but traces of it are to be found in the "Land Bank or Manufactory Scheme" of 1740.

The Grounds of Theistic and Christian Belief. By George Park Fisher, D.D., LL.D. Revised edition, in great part rewritten. Charles Scribner's Sons. 1902. Pp. xx, 463.

This is much more than a new edition of a work published twenty years ago and long held in deserved respect. The author, in the leisure of his retirement from the active work of the classroom, and in the light of a score of years of added study and familiarity with two decades of discussion, has completely rewritten the volume and made it essentially a new work. In its new dress it offers, as it did in the first edition, for the day when that was published, a strong presentation of the arguments for the being of God, a critique of the principal anti-theistic theories, and a vigorous and scholarly defence of the historic verity of the Christian faith as set forth in the Gospels. It is interesting to observe how the proportion of argument has altered in the author's discussion; and now, in the evidences of Christianity, an increasing weight, in this edition, is given to its moral or internal proofs, though Professor Fisher by no means abandons confidence in the historic significance and apologetic value of miracles. The most extensive single discussion of the book is that regarding the authorship of the fourth Gospel, and Professor Fisher here presents the strongest argument that has recently been offered in defence of the traditional ascription of its composition to the Apostle John. The recent antagonistic literature on the subject is carefully considered, and combated with much skill and learning. Altogether, whether its conclusions are accepted or opposed, the volume is well fitted to sustain the reputation of one who has long been regarded as a leader among the church historians of America.

BOOKS OF THE WEEK.

Annual Literary Index, 1902. Edited by W. I. Fletcher and R. R. Bowker. Publishers' Weekly.
Babcock, W. H. Kent Fort Manor. Philadelphia: H. T. Coates & Co.

An Artist's Creed

By E. P. B.

Sm. 12mo. Cloth, gilt. 75 cents net.

The Baptist:

"This choice little book deals with various aspects of beauty, not only in a poetical but in a philosophical manner, leading up to the wondrous beauty of God Himself. The absorption of the mind of the author in the idea of beauty is witnessed by the clear, pellucid style of his writing. It flows on like a charming poem, rich in its ideas and suggestions, and winning the heart, as well as the mind of the reader."

The Examiner:

"A sweet little volume, it abounds in beautiful epigram, and has a truly elevating style and tone."

SCOTT-THAW CO., 542 Fifth Ave., N. Y.

"As a Henry James document this volume is complete."
—*New York Sun.*

The Better Sort

By HENRY JAMES

Montgomery Schuyler writes:—

"In no book of his has Mr. James interposed fewer obstacles to the appreciation of himself than in this. In none has he vindicated more completely the position which all readers of English should be glad to accord him as a master of English letters, and which his own born countrymen, one would say, ought to be eager to claim for him." **$1.50**

Bookbinders and Their Craft

By Miss S. T. Prideaux. *Ready in April.*

Edition limited to 500 numbered copies, small 4to, rough edges, gilt top. Fully illustrated from the author's and others' designs. Right to advance price reserved. $12.00 *net* (postage 24 cents).

Literary Landmarks of Oxford

By Laurence Hutton.

Exquisitely illustrated by Herbert Railton. 12mo, $1.20 *net* (postage 12 cents).

A worthy companion to the entertaining and most useful books of Mr. Hutton which have made the "Literary Landmarks" title a recognized voucher, like Augustus Hare's "Walks."

By the Author of "Art for Art's Sake"

THE MEANING OF PICTURES

By JOHN C. VAN DYKE

"An unusual quality in art criticism, plain common sense with a delightful avoidance of technical jargon, is shown in the lectures delivered at the Metropolitan Museum of Art, in behalf of Columbia University, by Prof. John C. Van Dyke, and now published."
—*N. Y. Sun.*

"Professor Van Dyke drives home his arguments every time, speaking a language all can understand, talking with experience and natural taste for such things, and to students as well as to the general reader we heartily, unhestatingly recommend the work."—*N. Y. Commercial Advertiser.*

Freely illustrated. $1.25 *net* (postage 10 cents).

Shakespeare and Voltaire

By T. R. Lounsbury, Litt.D., LL.D., Professor of English in Yale University. 8vo, $2.00 *net* (postage 16 cents).

"Presents for the first time a complete story of the relations held by Voltaire to Shakespeare."—*Boston Transcript.*

Shakespeare's Portrayal of the Moral Life

By Frank Chapman Sharp, Assistant Professor of Philosophy in the University of Wisconsin. 12mo, $1.25 *net* (postage 10 cents).

INVALUABLE NEW BOOKS FOR NATURE STUDY

Our Northern Shrubs

By HARRIETT L. KEELER

With 205 photographic plates and 35 pen-and-ink drawings. Crown 8vo, $2.00 *net* (postage 16 cents).

This book is a companion volume to Miss Keeler's very popular "Our Native Trees" and is designed not only for the general lover of nature, who wishes to identify and learn the habits of our northern shrubs, but for those who are engaged in beautifying public and private grounds.

Trees, Shrubs, and Vines

Of the Northeastern United States
By H. E. PARKHURST

With over 250 illustrations, maps, etc. $1.50 *net* (postage 12 cents).

A general account and explicit botanical details of all the native trees, shrubs, and vines of this large area, as well as the most important of foreign origin, designed for those who have never studied botany, the plants being so classified that, with the assistance of a few pages on plant structure and without a microscope, the non-botanical reader can easily familiarize himself with all the tree, shrub, and vine life around him.

THE PRINCIPLES OF MONEY

By J. LAURENCE LAUGHLIN,
Professor of Political Economy in the University of Chicago.

This important work is the first of a truly monumental series of books, planned by the author, perhaps the first American authority in this branch of economics, on the general subject of Money. In this volume he clears the field for discussion of practical details, such as Metallic Money and its History in the United States, Paper Money here and in foreign countries, and banking, by establishing the theory underlying them. The book is an elaborately organized treatment of principles and constitutes an original and novel contribution to the science of political economy.

$3.00 *net* (postage 22 cents).

Note: Mary King Waddington's LETTERS OF A DIPLOMAT'S WIFE will be published early in May.

CHARLES SCRIBNER'S SONS, New York

The Nation

VOL. LXXVI—NO. 1974. THURSDAY, APRIL 30, 1903. PRICE TEN CENTS.

THE AMERICAN SPORTSMAN'S LIBRARY

Edited by CASPAR WHITNEY. 20 Fully Illustrated volumes
Bound in Cloth, gilt, crown 8vo, Gilt tops, $2.00 *net* per volume (postage 15 cents)

PREVIOUSLY ISSUED:

THE DEER FAMILY

By the Hon. THEODORE ROOSEVELT and others. Illustrated by CARL RUNGIUS. With Maps by Dr. C. HART MERRIAM.

SALMON AND TROUT

By DEAN SAGE, W. C. HARRIS, and C. H. TOWNSEND. Illustrated by A. B. FROST and others.

UPLAND GAME BIRDS

By EDWYN SANDYS and T. S. VAN DYKE. Illustrated by LOUIS AGASSIZ FUERTES, A. B. FROST, J. O. NUGENT, and C. L. BULL.

JUST READY:

THE WATER-FOWL FAMILY

By L. C. SANFORD, L. B. BISHOP, and T. S. VAN DYKE. Illustrated by L. A. FUERTES, A. B. FROST, and C. L. BULL.

BASS, PIKE, PERCH, and OTHERS

By JAMES A. HENSHALL, M.D. Illustrated by MARTIN JUSTICE and CHARLES F. W. MIELATZ.

THE BIG GAME FISHES
OF THE UNITED STATES

By CHARLES F. HOLDER. Illustrated by CHARLES F. W. MIELATZ and others.

TO BE ISSUED EARLY NEXT FALL:

THE BISON, MUSK-OX, SHEEP AND GOAT FAMILY
THE BEAR FAMILY
COUGAR, WILDCAT, WOLF, AND FOX
GUNS, AMMUNITION, AND TACKLE

In preparation; to be issued within the next year and a half:

Photography for the Sportsman Naturalist
The Sporting Dog
The American Race Horse, The Running Horse
Trotting and Pacing
Riding and Driving
Baseball and Football
Yachting, Small Boat Sailing, and Canoeing
Rowing, Track Athletics, and Swimming
Lacrosse, Lawn Tennis, Wrestling, Racquets, Squash, Court Tennis
Skating, Hockey, Ice Yachting, Coasting, and Skate Sailing

THE AUTHORS of the volumes named include only men whose reputations are national as authorities on the sports of which they write. Mr. THEODORE ROOSEVELT opens the series with papers on deer, elk and antelope, aided by D. G. ELLIOT and A. J. STONE, supplemented with an account of Pacific Coast varieties by T. S. VAN DYKE, who in other volumes writes of the upland game and the water-fowl of the same region; EDWYN SANDYS treats also on upland game, L. C. SANFORD and L. B. BISHOP of water-fowl, while the volumes on different kinds of fishing are contributed by such well-known writers on the sport as DEAN SAGE, C. H. TOWNSEND, WM. C. HARRIS, JAMES A. HENSHALL, who contributes the volume on Bass, Pike, Perch, etc., and CHARLES F. HOLDER, who describes the big game fishes.

THE ARTISTS are of equally high rank, each as a specialist in the illustration of the subject treated, including Carl Rungius for drawings of animals; Louis Agassiz Fuertes, A. B. Frost, C. L. Bull, and others, in the volumes on birds; A. B. Frost, C. F. W. Mielatz, Martin Justice, and others in the books on fishing; the new volume on the big game fish will contain eight plates in color by C. F. W. Mielatz.

THE SET will be at once the most adequate, authoritative, and comprehensive series on American sport ever issued; it will be an incomparably valuable part of the library of every man who knows the delights of rifle, rod, or gun.

Each bound in cloth, gilt, crown 8vo, gilt tops, $2.00 net, (postage 15c.)

For a full descriptive circular of the Library and a specimen plate in colors, with particulars as to special terms to subscribers to the set, address the publishers

FERRIS & LEACH, Publishers, Nos. 29-31 North Seventh Street, PHILADELPHIA.

An Artist's Creed

By E. P. B.

Sm. 12mo. Cloth, gilt. 75 cents net.

The Baptist:

"This choice little book deals with various aspects of beauty, not only in a poetical but in a philosophical manner, leading up to the wondrous beauty of God Himself. The absorption of the mind of the author in the idea of beauty is witnessed by the clear, pellucid style of his writing. It flows on like a charming poem, rich in its ideas and suggestions, and winning the heart, as well as the mind of the reader."

The Examiner:

"A sweet little volume, it abounds in beautiful epigram, and has a truly elevating style and tone."

SCOTT-THAW CO., 542 Fifth Ave., N. Y.

The Cloister Library

The Nation.

NEW YORK, THURSDAY, APRIL 30, 1903.

The Week.

Mr. Carnegie's public benefactions come in such swift succession and such large sums that only a professional accountant can keep track of them. They have one distinguishing feature, however. Each gift has a definite purpose in the mind of the donor, and is precisely adapted to the end in view. Money is not handed out indiscriminately. Every dollar is made to go as far as possible to carry out the purpose, and none is to be wasted. The gift of $600,000 to the Tuskegee Institute is an example in point. It is coupled with a condition that, out of the sum named, provision shall be made for Mr. and Mrs. Booker T. Washington, so that Mr. Washington need not spend his energies and the best years of his life in scouring the country to get money for the support of the Institute, and need not be in anxiety for his own family. Declining years will come to him, yet since he has never employed his rare gifts as a speaker and an organizer for his own benefit, he has accumulated nothing. He has refused every opportunity to make money for himself. Although large offers have been made to him as a lecturer, he has always put them aside, in order to give all his strength to the training and upbuilding of his race. He has refused to be swerved from this great purpose, and now he realizes the truth of the sacred text: "All these things shall be added unto you." Mr. Carnegie gives more than an ordinary present to Tuskegee when he gives to Booker Washington the leisure to dispose of his own time for the best interests of his Institute and his people. But it should be clearly understood that further sums are greatly needed. Each year $152,000 has to be raised. The Carnegie gift will yield $30,000 annually. Others should come forward, not only to make up the deficiency, but to secure an endowment sufficient to carry on the work of this great educational institution.

After weeks of suppression, Secretary Root, in response to a rapidly growing public demand for it, has seen fit to give to the public parts of the report made by Nelson A. Miles, Lieutenant-General Commanding the Army, upon the atrocities which came under his notice while in the Philippines. Lest there be any misunderstanding as to how Gen. Miles came to make this report, we would recall to our readers that he was ordered by Secretary Root and President Roosevelt to proceed to the Philippine Islands upon a tour of inspection, and to report in writing as to the condition of the troops, their efficiency, discipline, stations, etc. It was in accordance with his written instructions, therefore, that he composed in Manila this remarkable document, full as it is of tales of horrors, rivalled only by the Spanish cruelties in Cuba about which we went to war in 1898. Now what must be said of a Secretary of War who selects the highest officer for inspection duty, and then, after suppressing the report on the ground that it is "confidential," seeks to prove as he has done, by publishing it, that the General is mistaken in his judgments? Had Mr. Root himself accompanied the report with a statement that Gen. Miles was misled, he would have been wholly within his rights. Instead, he has deliberately gone out of his way to break down the discipline of the service by ordering subordinate officers to attack the veracity of their military superior, or to expose the alleged errors of judgment into which he has fallen. The Chief of Engineers, the Chief of Ordnance, the Surgeon-General, the Commissary-General, the Judge-Advocate-General, and Major-Gen. Hughes, in whose department occurred the worst cases of water-cure (as *proved* by courts-martial), are all called upon to reply to those portions of the report which bear upon them. The bureau chiefs' replies are *embodied* in Miles's report itself; Gen. Hughes's is suppressed because it is "not gentlemanly." To cap the climax, Gen. Chaffee bursts forth in an interview declaring that the report of his superior is of no importance. If this is not military anarchy, what could be?

A detailed review of the legislation of the session of the Legislature which closed at Albany on Thursday is not necessary. Three measures were most debated—the canal-enlargement bill, the excise-tax law, and the mortgage-tax bill. The two former were passed, as unquestionably a majority of the people wished that they should be. The latter died of congenital weakness and early exposure. As for the so-called "grab" bills, designed to secure valuable privileges and franchises by sneak-thief methods, they have all been either killed outright or left in a position where a veto by Mayor of Governor will give them their quietus. This last is, we believe, distinctly the case with all the bills injuriously interfering with New York city government. Mr. Low can put the lot out of misery. As respects measures of taxation and finance, no account of the events of the winter would be fair which did not admit a pretty complete shattering of Gov. Odell's prestige as an authority in those subjects. In his first term, he built up for himself a great and apparently deserved reputation as a man of business grasp and unusual skill in devising fruitful schemes of taxation. Two years ago, his message was a programme of legislation. This year, his message was one long list of proposals which should not have been made, and which, in fact, have not been enacted. All his tax measures have been either abandoned or heaved overboard. His final message on the mortgage tax was filled with pitiable vacillation and confessions, so that it is no wonder the whole plan was given up in general disgust. Whatever credit the Governor may deserve in matters financial comes from his resolute turning, at the end, to economy in expenditure, instead of to wanton taxation, as a means of making the books balance. But this he should have done from the very first.

As was expected, the preliminary report of Messrs. Ford and Berard, the expert accountants, shows that our city bookkeeping is both cumbrous and lax. Different accounts are "jumbled," it says, and the whole system is in need of revision and simplification. Its present complexity and uncertainty almost place a premium upon extravagance, if not peculation. This whole subject has a vital place in the general movement for the bettering of American municipal government. Municipal accounts have been so incomplete, and sometimes misleading, that it has been difficult to determine precisely what has been done with the money of the taxpayers; while the diversity in the methods of bookkeeping has been so great as to make it almost impossible to establish satisfactory comparisons that would enable one city to profit by the experience of others. When the Department of Labor undertook, some years ago, to make a compilation of the financial statistics of municipalities, the officers in charge of the investigation learned that in some cities "no printed reports were available"; while the data secured in most cases were so unsatisfactory that an adequate comparison of the figures was a work of extreme difficulty. The financial statements of some cities have effectually concealed the fact that for a period of several years the expenditures had exceeded the current revenues. The capital accounts of public industries have often been neglected, so that the results of their operations have not been easy to ascertain. It has been possible for disputes to arise over such questions as the increase or decrease of municipal debts during one or several administrations, while important departments of the governments have kept little more than bare cash accounts. Such conditions have served inevitably to impair

municipal credit, and to raise the rates of interest which cities have been obliged to pay. Political bosses could hardly ask a fairer field for the display of their peculiar talents.

The organization of employers of labor at Omaha, to resist boycotting, sympathetic strikes, and other means of coercion by trade unions, seems to have been prompted by the action of the New Orleans Convention of Manufacturers. At all events it followed very closely after that deliverance. Yet it is not by any means a new thing in the country's experience. There have been previous local agreements of employers to stand by each other in resistance to trade-union tyranny. The great lockout of the building trades in Chicago, which lasted eighteen months and paralyzed that industry, was similar to the one with which Omaha seems to be threatened. It is much easier to utter warnings against these conflicts, to point out the losses they involve, and to show how nicely the differences between labor and capital might be adjusted by boards of conciliation and arbitration; but until these wholesome conceptions are woven into the framework of society so that they will work automatically to some definite conclusion, we see no other course open to the employers than to resist the boycott and other forms of organized coercion by counter-organization. No employer can wait till his property is gone from him before taking steps for self-defence. Long experience has shown that employers cannot successfully resist the boycott one by one. As we understand it, the Omaha employers have merely agreed to organize, as the trade unions are now organized, so that they can present a solid front as the unions themselves do. Perhaps we shall some time reach the happier industrial state which the North of England Boards of Conciliation represent; but we cannot expect it while the boycott and the sympathetic strike remain the most common weapons of organized labor.

In the receivership of the Chicago Union Traction Company, which embraces the West and North Side street railway lines, we see one of the consequences of the failure of the syndicate of New York, Philadelphia, and Chicago capitalists to secure from the City Council what they considered a sufficient extension of the franchises which soon fall in. This was the principal issue in the late municipal election. Both political parties were pledged either to short terms of lease or to municipal control and operation, and these pledges were held in force by the Municipal Voters' League, which has made it possible to elect and keep in power an unpurchasable Board of Aldermen. The receivership has been ordered by Judge Grosscup of the United States Circuit Court as the result of unsatisfied judgments aggregating $1,368,180. The significance of this debt arising against a company which has hitherto been very prosperous, is not apparent. We can well believe, however, that the step was not taken for the purpose of forcing the municipal authorities to make the extension of the franchises which the syndicate asked for. The fact is that the municipal authorities of Chicago can be neither coerced nor bought. The city itself has no money invested in the traction company, and it is not likely that Judge Grosscup's receivers will allow the roads to stop running. The franchises cannot be extended without the vote of the City Council or of the Legislature, and both of these are in sympathy with the Voters' Municipal League.

Ramsay County, Minn., of which the city of St. Paul is the principal part, is about to undertake an interesting reform of its jury system. This is rendered possible by the passage through the Legislature of a bill empowering six judges of the District Court to appoint three commissioners to prepare a list of men who "by education, business habits, moral character, and physical health" are qualified for service as jurors. These are the qualities which jurors chosen in the careless fashion of most localities do not possess. The question whether or not the persons named in the new list actually have the required attributes is not to be left to mere conjecture or chance. The law provides that the fitness of prospective jurors be ascertained by "actual inquiry," for which work of investigation the commissioners are to receive suitable compensation. If, in addition to applying this promising system, the county authorities and judges insist on the performance of jury duty by men thus declared to be fitted for it, the result cannot fail to be beneficial. Many a scheme of jury reform has failed by reason of undue exemptions selfishly demanded and weakly allowed.

Significant of the present attitude of Canada on tariff matters is the readiness with which she has met the increased German schedules by applying her own maximum schedules to German imports. This somewhat abrupt interference with a promising trade of about $9,000,000 a year is perhaps due to political rather than economic considerations. Taking advantage of the present anti-German feeling of the British Empire, the Liberals in power are able to throw a sop to the ultra-protectionist Conservatives without fully committing themselves to their policy. Yet the pressure to increase the Canadian duties is going to be strong. Even a lavish bestowal of direct bounties has not served to abate the protectionist thirst. But it would still be possible, if our Government would assume the initiative heartily, to negotiate a reciprocity treaty with Canada, and it will obviously be more advantageous to do so on the basis of the present duties than it will be after Canada, adopting German policy, has set her duties absurdly high, "as a basis of negotiation." It is in the interest of both Canada and the United States to avoid a tariff war. The duty of making it impossible rests largely with us. And we must bear in mind that we can never get, what so many of us appear to desire—namely, the Irishman's "reciprocity all on one side."

Casual attention in England, and, we presume, in this country, will be caught by the remission of taxation which the Chancellor of the Exchequer is able to announce in the new budget. All told, this amounts to about $50,000,000. Cutting down the income tax by fourpence means a relief to taxpayers of more than $40,000,000 annually, and the abolition of the grain duties signifies not only the removal of a political grievance and a taking party cry—that the Government was responsible for a "bread-tax"—but a lowering of the taxes by some $10,000,000. Here, then, would appear to be a notable reduction of taxation; but the really significant thing is not the amount taken off, but the amount left on. Going back to the last year of the last Liberal Government—1895-96—we find that the total sum raised by taxation was $475,000,000. This year's budget, counting in Chancellor Ritchie's remission of taxes, proposes to raise $723,000,000. That is to say, with the Boer war over and the country again on a peace basis, the expenditure has gone to a permanently higher level. Taxes that went up nearly 50 per cent. as a result of the war, are to stay up about 30 per cent. after the war is over. This phenomenon is perfectly familiar in financial history. Taxation does not, after a war, flow back into its old channels. As Sir George Cornewall Lewis pointed out after the Crimean war, the inevitable tendency of any war is to leave behind it an increase of taxation in a permanent form. It is what John Morley has called the "backwash of war."

We have had ample experience of it in this country. It is not necessary to go back to the period following the civil war. That was an era of extravagance, in spite of the fact that the country was almost exhausted by the long and fearful struggle. But take a later and fresher proof of the old truth. The Spanish war did for us what the Boer war did for England—raised permanently the level of national expenditure, and so of national taxation. For the four years before the blowing up of the *Maine*, the annual appropriations, as printed in the

Government 'Statistical Abstract,' averaged about $300,000,000. The war drove them up at once to $673,000,000. But they fell back only part way when the war was over. They dropped first to $462,000,000, then to $457,000,000, but shot up again in 1902 to $479,000,000. The last Congress pushed them higher yet. Thus we are in the same boat with England. An "easy" war has fastened upon either country a permanent burden of new taxation amounting to $150,000,000 annually.

Mr. Balfour's retreat from something that looked like another German alliance, in the matter of the Bagdad railway, is ostensibly based on financial grounds. The Government, he said on Thursday, had not found it advisable to guarantee the British capital which it was proposed to embark in that enterprise. This of itself was a sufficiently humiliating confession for him to have to make, since he had assumed a particularly jaunty tone when the matter came up in the Commons on April 8, in regard to the alleged financial difficulties of a "railway which goes through a very rich country." He has perhaps found that the country was not so rich as he thought it was, and has surely discovered a strong sentiment in England against any more entanglements with Germany. The incident may help the Ministry at home—where it certainly needs all the help it can get—but will be apt to make a bad impression in Berlin.

International junketing is seldom of any permanent usefulness—so the myriad entertainers of Prince Henry of Prussia often reflect; but the official visit of King Edward to Paris may prove an exception to the rule. The enthusiasm which will be manifested for the royal guest will be only an official expression of the kindly sentiments he has won for himself during many visits as a private gentleman. His urbanity has endeared him to the many Frenchmen with whom he came informally in contact, and it will not seem ungracious to observe that a legend of indulgence did him no harm in the pleasure ground of Europe. He comes at an opportune time when old grudges, like the occupation of Egypt, have been forgotten, and outstanding disputes at least temporarily adjusted. The mob which sees him pass will perceive that he is not, as the caricaturists have represented him, an ogre who eats Boer babies. It appears that his reception will fairly rival in heartiness that given to the Czar when the Franco-Russian alliance was proclaimed. It will be a distinct gain if the Parisians forget their pet phrase, *perfide Albion*, for there are many worthy causes—notably that of reform in the Balkans—which have much to gain from a good understanding between France and England.

That the French War Office is to reopen the Dreyfus case will hardly be doubted by anybody who has read the debates of April 8-10, in the Chamber. There it appeared clearly that Cavaignac, Minister of War at the time of the Zola trial, had deliberately suppressed a letter of Gen. Pellieux. This extraordinary letter charged the General Staff with forgery. Cavaignac never presented the letter to President Brisson, and, through Gen. Zurlinden's mediation, persuaded Gen. Pellieux to withdraw it. Under cross-examination before the Chamber, Cavaignac avowed this act, and defended it. His reason for failing to show that one of the capital pieces upon which Dreyfus's condemnation rested was a forgery, was that he, personally, was convinced of Dreyfus's guilt. Or, as Jaurès, interrupting, drove home this extraordinary confession, Cavaignac assumed to be "sole judge" of Dreyfus's moral guilt, and took the ground that, though wrongfully condemned, the Jewish captain was yet guilty. It is doubtful if a Minister of State has ever before been forced to so disgraceful an avowal. In striking contrast to Cavaignac's wholly contemptible attitude, was Gen. André's statement that, in view of the charges of Gen. Pellieux made while conducting the prosecution, the whole evidence would be reviewed, and appropriate action taken. But, in fact, it makes little difference what is done by the Government and the War Office, which have, however, given every assurance of loyalty; through Jaurès's indefatigable zeal in seeking new evidence, and his eloquence in presenting it to the people of France and to the world, the Dreyfus case *is* reopened.

At the French Socialist Congress recently sitting at Bordeaux, the question arose of expelling M. Millerand, the Parliamentary Socialist. As Minister of Public Works under Waldeck-Rousseau, and subsequently as a private citizen, he has steadfastly insisted that Socialism must seek its ends not by revolution but by gaining control of the regular machinery of Government. Those who believed with him in the theory of gradual reform were contemptuously called "the yellows" by the revolutionary Socialists —who are "the reds." His vindication by the representatives of Socialists of all degrees can only mean that in France Socialism is taking its place among the Liberal parties, and is ceasing to be a subversive force. The same process has gone much further in Italy and Germany, where the Socialist parties work regularly with the other parliamentary groups, and base their hope of supremacy not in fomenting the war of classes, but in dealing with things as they are. This tendency of Socialism to convert itself into the ordinary forms of Radicalism is a very hopeful sign of the times. It shows that, before the practical work of legislation, the wildest theories yield to common sense; and some day the United States is likely to have more than an observer's interest in the matter, for it is wholly unlikely that the labor movement in this country will end short of some form of political Socialism, if by a slower and more devious process.

The report that Russia has presented severe demands touching Mantchuria, the substance of which is "J'y suis, j'y reste," is grave, but not unexpected. Indeed, the demands embrace something more. Not only does Russia remain where she is in Mantchuria, but she requires China to promise not to admit any other Power into that vast territory. No new treaty ports are to be granted, and no new foreign consulates are to be admitted. From St. Petersburg, however, we are told that, of the eight demands said to have been made by Russia, four are absolutely false, one is unimportant, two others involve no change in previous arrangements; and that the only one which is both new and important relates to a sanitary commission to keep out contagious diseases. Be this as it may, nothing but divine power or an internal revolution of her own can prevent Russia from absorbing Mantchuria eventually. She has the position and the forces to carry out her purpose, whatever it may be, but her policy in the past has been to accomplish her ends by diplomacy. In Korea she avoided trouble with Japan by allowing France and Germany to intervene in an advisory capacity. In the later troubles at Peking she got her standing at New Chwang recognized by promising to restore its government to China at a definite time. She now says that its revenues must be paid into the Russo-Chinese bank instead of the Chinese Customs Bank. Where the revenues are, there the Government is also. But who is going to dispute this point with Russia?

A dispatch from Yokohama says that three Japanese warships have been ordered to New Chwang, and that Japanese feeling is much excited by the Russian demands. For Japan, indeed, the situation is crucial. She needs a field for trade and emigration to the west which the Russians are occupying. She will never again be able to fight to so good advantage as now, when she could make a great deal of trouble for the Russians. But in such a campaign she could not claim the support of England, for the alliance becomes operative only when either party is at war with *two* hostile Powers. France, of course, may be counted out of the folly of taking any active part with Russia in the Far East. Before deglutition, the Bear declares his intention of licking the Mantchurian morsel into shape. Who dares interfere with his feast?

THE ALABAMA DECISION.

The exact legal effect of the recent decision of the Supreme Court in the Alabama case, involving the disfranchisement of negroes under the new State Constitution, is difficult to determine. It is not certain, from the somewhat confused report of the different opinions, whether the court passed upon the Constitutionality of those clauses of the Alabama Constitution which were ingeniously and avowedly framed to disfranchise the negro. But no doubt appears to be left that the prevailing opinion of Judge Holmes extinguishes the hope of colored men in the South that their electoral wrongs might be righted by the Supreme Court of the United States, exercising its powers of equity. No such relief can be granted, decides the majority of the court. It rejects the appeal of the counsel for the disfranchised negroes—himself a negro, by the way—to "look through forms at the substance" and to "detect and expose fraud and conspiracy and cunning and chicanery."

That this language is not a whit too strong to describe the intent and effect of the Alabama Constitution, will be doubted by no one who has read the proceedings of the recent Constitutional Convention in that State. Discrimination against the negro was written all over it. Not the slightest concealment was attempted. The Convention, made up *exclusively* of white men, though nearly half the population of the State is colored, met under the distinct pledge of successive party platforms to disfranchise no single white man, except for infamous crime. It was boldly stated by one speaker, whose views prevailed, "We cannot afford to disfranchise the ignorant and illiterate white." Another debater declared, accurately betraying the animus of the Convention: "This is a white man's country, and I believe that not a single white man should be disfranchised, and I am opposed to the enfranchisement of any negro in the State of Alabama, let it be *Booker Washington or any one else.*"

Now how did these men get around the plain inhibition of the Constitution of the United States (which they had all taken an oath to support) against the denial or abridgment of the right to vote "on account of race, color, or previous condition of servitude?" The truth is, they scarcely expected to be able to get around it. They were plainly warned that their proposed action would be unconstitutional. Senator Morgan frankly told them that the Supreme Court would be bound to declare their plan null and void under the Constitution, and so, we believe, did Senator Pettus. On the floor of the Convention, able lawyers spoke to the same effect. Yet the scheme was persisted in, and by an intricate and crafty plan of qualifying and registering voters, the end has, in fact, been attained. Under what purports to be an impartial educational and property qualification, every white man in the State, illiterate and worthless though he may be, has been made a registered voter, while thousands of negroes have been deprived of the suffrage they once enjoyed, and hundreds fully able to qualify under the new provisions have been refused registration.

The tricky means by which this work was accomplished cannot be set forth at length here. There was the so-called "grandfather clause." Under it, those who bore arms in the war between the States, or their *descendants*, are entitled to vote all their lives, irrespective of the test of literacy or property. This, by the way, was in flat violation of one of the clauses of the Alabama Constitution itself, which declared that "no hereditary distinction . . . shall ever be granted or conferred in this State." It was confessed that some of these ex-Confederates and their sons were ignorant and immoral in the extreme. One speaker admitted that "some of those people and the descendants of those people carry the mark of rascality written upon their face." Yet all that white riff-raff had to be admitted to the suffrage. One member of the Convention gravely argued that the worst of them had "inherited" the ability to share in self-government, and, in the good old Southern style, he quoted Scripture for it: "I am persuaded that the unfeigned faith which dwelt in thy grandmother Lois and thy mother Eunice dwells also in thee." The solemn President of the Convention cited that text as proof of the "inherited capacity" of the poor and illiterate whites, and nobody laughed. But the rule is not allowed to work both ways. Negroes who bore arms in the civil war have applied for registration, and have been rejected. They were on the Northern side, unluckily. They fought for a Government which afterwards declared them citizens of the United States, though now the Supreme Court confesses itself unable to protect them in their rights of citizenship.

The enormous and indefinite powers put into the hands of the Boards of Registration in Alabama have been a potent means of disfranchising colored voters really qualified. In their discretion, they could register "all persons who are of good character, and who understand the duties and obligations of citizenship under a republican form of government." How easy, under that, for white registrars to shut out negroes! That was in the "temporary plan"—that is, the plan for getting all white men permanently upon the list of voters in the first year. The "permanent plan," which went into effect on January 1, 1903, had special provisions of which the obvious intent was to shut out negroes who might be able to qualify under the general educational and property system. Thus, any negro might be rejected if he could not state, under oath, "where he lived during the five years next preceding, and the name of his employer or employers, if any, during such period." The intent to intimidate and discriminate glares in this provision, as it does in other parts of the sections relating to the suffrage.

Judicial relief from this injustice is denied by the Supreme Court. It declares that the remedy for such political wrongs must be political. That points the way to the next step. Congress must act. It has full legal power to enforce a political remedy. Under the Fourteenth Amendment, it can reduce the representation of those States which disfranchise large classes of their citizens. Still more effectively, perhaps, can action be taken under that clause of the Constitution which provides that "each house shall be the judge of the elections, returns, and qualifications of its own members." The House may go behind the face of the credentials of Southern Congressmen. It can inquire into the registration of voters, can expose unequal disfranchisement, and seat contestants who may allege and prove that lawful voters were deprived of the right of suffrage. In any case, and in all ways, the South must be given to understand that there is a national conscience which will not sleep in the presence of injustice to the negro. He is entitled to the full and equal protection of the laws. The suffrage cannot be taken away from him unfairly. His right to be educated, to improve his lot, to hold office when fit, can be questioned no more than that of any other American citizen. And the sooner the Republican party sets about the work of completing its mission in behalf of the negro, the sooner will it create a soul under the ribs of death.

NORTH AND SOUTH AT RICHMOND.

The Richmond meeting of the Southern Educational Conference, which ended on Sunday evening with a memorial service in honor of the late J. L. M. Curry, marked a long step forward in the movement begun six years ago by a handful of Northerners and Southerners at Capon Springs, Va. At the Athens Conference, a year ago, it was still necessary for the Southerners to proclaim their adherence to the cause, while the Northerners devoted a good deal of time to explaining its *raison d'être*. This year, from the statements of the field directors to the shortest of the impromptu addresses, there were few words wasted along these lines. It was essentially a conference to report progress, and, in many respects, a most gratifying advance. If the spirit and enthusiasm of the crusader were somewhat

lacking this year, there was, on the other hand, a broader range in the discussions; and some noticeably inspiring and encouraging notes were sounded—principally, it must be said, by speakers from the South.

Hitherto the conferences have dealt very largely with the problems of the rural schools, the necessity of consolidation, of longer terms, better teachers, and improved buildings. This year there were discussed, in addition, such questions as the relation of the teacher to the State; the responsibility of Government for public education; local taxation; the duty of the citizen, and the work of the university in the Southern States. The last-mentioned subject offered a most excellent opportunity for frank speaking, for the thraldom of the Southern professor to Southern prejudice has long hampered and still continues to hamper the growth of Southern colleges into true and broad institutions of light and learning. The opportunity was eagerly grasped by Prof. Edwin Mims of Trinity College, Durham, N. C. Evidently having in mind the case of Professor Sledd, who was dismissed from a Southern college for an article on the negro problem in the *Atlantic Monthly*, Professor Mims made an eloquent plea for academic freedom of thought and utterance, without which no college can hope to fulfil its duty to the community which maintains it or to the nation whose youth it educates. That such clear and fearless speech should have come from a Southern-born teacher is as encouraging as it is exceptional. It would seem to indicate that the broad spirit of the Southern educational movement is already stirring collegiate circles.

A still more striking utterance from a Southerner was the address of Chancellor Hill of the University of Georgia, It dealt with the question of negro education in so broad and unprejudiced a spirit as to delight all advocates of justice to a downtrodden race, who heard or read it. It is not too much to say that it would have been impossible ten or even five years ago. Yet Mr. Hill's insistence upon the South's duty of educating the negro was warmly applauded by the Southern audience which listened to him. It would be well if every white schoolhouse in the South could have upon its walls Mr. Hill's declaration that "the only thing which the South cannot afford in its relation to the negro race is injustice; all history teaches that injustice injures and deteriorates the individual or nation that practises it, while on the other hand it develops and strengthens the man or race upon which it is inflicted." A similar sentence in Mr. Cleveland's recent address in this city would have increased its value enormously.

While these and other speeches of Southern men were among the most encouraging features of the Richmond Conference, it must be said frankly that the Northern men did themselves far less credit. Dr. Lyman Abbott went out of his way to reiterate his assertion that "manhood suffrage means manhood first and suffrage second," and that "no man has a right to govern his neighbor who has not the intelligence and the conscience to govern himself." As with similar utterances of Northern men, these views are accepted by the ignorant and prejudiced as justifying any amount of repression of the negro. "We cannot afford," said the President of a Southern college, "to permit Dr. Abbott to speak as he does; it encourages those who would for ever disfranchise the negro, and makes the tasks of those of us who would uplift the negro infinitely harder."

The greatest danger which confronts the Southern Conference in its annual meetings is obviously the desire to avoid friction and to pour oil upon troubled waters. To express sympathy with the South in its difficult problems, as Mr. Cleveland did, is both wise and just. To allow one's sympathy with the South to blind one to its wrongdoings and shortcomings is to help no one. Academic freedom is to be obtained only by such courageous words as those of Professor Mims, and by public approval of those like him who have in their hearts the true conception of the functions of a university. Justice for the negro is to be obtained only by words like those of Chancellor Hill, and by outspoken reprobation of deeds of violence and injustice. Hand in hand with applause of Southern gifts to negro education, of Southern patience and Southern bravery in facing problems of readjustment, must go wise insistence upon Southern faults and Southern weaknesses, together with reproval of Southern wrongdoing. Otherwise the true aims of the Conferences will be overlooked in the general desire to forget the past and to avoid what are known as "dangerous topics."

"PERSONAL PUBLICITY."

When the Lieutenant-Governor of Missouri, Mr. Lee, went into hiding for several days, after the publication of the bribery scandal in which he was involved, it was surmised that he was a shrinking and sensitive soul. This suspicion is now confirmed by his letter of resignation, in which he says that he surrenders his office out of a strong wish "to retire from personal publicity." Evidently, Mr. Lee is one of those delicate natures never meant for contact with a rough world. He should now be left to that seclusion (with the Grand Jury) and secrecy (in a prison cell, if he doesn't make a c'ean breast of it and turn State's witness) which he so much craves. His case, however, furnishes an instructive instance on a small scale of what is now going on wholesale at Washington. The overweening desire of the authorities engaged in running down the Post-office frauds is all too plainly to avoid the same "personal publicity" which is so highly distasteful to Lieut.-Gov. Lee of Missouri.

A high official gave out on Monday a friendly account of Postmaster-General Payne's method of investigation. It was to be thorough, but "quiet." He never expected to permit "so much publicity as has been given the affair." His idea was softly to find out who the scoundrels were, and gently to get rid of them, without any fuss or scandal. It was not Mr. Payne's purpose, this semi-official explanation informs us, to "publish from the housetops" all the "various doings of the Department relating to the investigation." It was not that he had friends to protect, but he wanted to spare the feelings of the incriminated officials and their families, and to prevent the good name of the service from being smirched.

This plan of pursuing fraud with felt slippers and catching rogues with fur gloves is said to have had the approval of the President. With him, according to the statement, the Postmaster-General went over the whole situation. Mr. Roosevelt insisted upon thorough investigation, but agreed that it should be purely a family affair, the dirty linen to be washed under cover, and none of it hung out on the line. There was thus to be no offensive "publicity." Before going on his Southern trip, Mr. Payne arranged to have his "thorough" investigation kept under lock and key, and accordingly he was "greatly surprised," on his return to Washington, to "find the situation in a very bad way, and an extent of publicity which he thought harmful." We note, in passing, that the surprise which he publicly expressed at the time related to the charges of rottenness in his Department. He did not then say, as he does now, that he had long known about the crookedness, and had given orders to have it corrected, all as between friends. But it is not the Postmaster-General's sincerity, only his tactics, upon which we are moved to comment.

And the first thing to be said about this "gum-shoe campaign" against fraud in the public service is that it is a policy utterly impossible to carry out, even if it were wise. To say nothing of an inquisitive press, how could the Postmaster-General imagine that he could thrust a quiet hand into a ramified Department, tainted in many parts by fraudulent operations, and pluck out here and there an offender, in silence and concealment? It was certain that he would bring the hornets about his ears. Detected cheats do not take their medicine so meekly as Mr. Payne thought. They fly to their Congressional backers. They complain of "star-chamber methods," allege that they were the victims of spies and informers, assert that oth-

ers were more guilty than they, and, in general, kick up all the dust and make all the row they can. Obviously, the way to eject a scoundrel from the public service is not to open a back door for him in the night, but to fling him out at the front entrance, with a plain statement of his offences given to all the world. Publicity is the very thing you must seek when turning out discredited officeholders, and the more personal and offensive you can make it the better—that is, if you are really bent on making thorough work of it, and affixing a brand of shame to every man caught prostituting public office.

What we have felt to be lacking in this whole business, from the beginning, is a resolute and uncompromising tone on the part of the responsible authorities. In so far as the President suffers from having an evasive and shirking Postmaster-General, when he should have a perfect *malleus hereticorum* for this emergency, the fault is his own. He chose a man for the office, purely as a politician, not as an administrator. While Mr. Payne was devoting all his energies to making smooth the path of renomination, fraud and cheating flourished in the Department which it was his first business to keep in order. This blow to the Administration is not, therefore, undeserved; there is even a sort of poetic justice in the sight of Roosevelt the reformer, who has undoubtedly done a great deal for the improvement of the public service, now embarrassed by misdeeds in a Department which he sacrificed to political demands. It shows how quick Satan is to catch a saint tripping. The pleasant vices of a reformer become whips to scourge him. But the President can yet clear his own skirts if he will insist upon the most unrelenting and open pursuit of every implicated official. To "mismanage trifles" has been said to be the cause of wars and of the loss of battles. The Post-office scandals are no trifle, but they have been greatly mismanaged thus far. It is for the President to see to it that the truth is brought out, no matter whom it may hurt, and the guilty men punished, whether it harms the party or not. Nothing can so harm it as the Postmaster-General's course of leniency and suppression.

INCORPORATING TRADE UNIONS.

A bill is pending in the Legislature of Connecticut for the incorporation of trade unions. Besides giving opportunity for associations of workingmen to be incorporated, if they so desire, it provides that thirty days' notice must be given of an intended strike on any railway, or public-service corporation, such as a gas, or electric light, or power company. The need of such legislation was strongly suggested by the action taken by Judge Adams in the Wabash Railway case, in which the court granted a temporary injunction against strikers, without any law, but simply on the ground that irreparable harm would be done to whole communities if the movement of trains should be interrupted. The injunction was obeyed by the strikers, and when the differences between the railway company and its employees came up for hearing, the injunction was dissolved. The strikers were then free to retire from the company's service, but they decided not to do so, the interval having been wisely used to effect a compromise. In this case everything that could have been done by the court, if the employees had been incorporated as a company, was done without incorporation; and there are men of repute in the legal profession who hold that it would be of little, if any, advantage to employers to have a law passed compelling trade unions to become incorporated, even if such a law should be Constitutional. If an incorporated company has a fund in its treasury, damages can be collected from it in certain cases; but since the amount on hand at any given time would be at the discretion of the officers, the amount of damages collectible would be within their own control.

In the first number of the *Monthly Review* of the National Civic Federation, Mr. James A. Miller, Chairman of the Legal Committee of the Building Contractors' Council of Chicago, discusses this question from the employer's standpoint, and holds that the latter has all the law that he needs now. What is wanted is not more laws, but the enforcement of what we already have. If what we now have cannot be enforced because judges, governors, and sheriffs fear the "labor vote," what, he asks, is the use of enacting more laws of the same kind?

This number of the *Review* of the Federation contains a symposium on the question, "Should Unions Incorporate?" There are fifty-four participants in the discussion. Every possible view of the subject is presented. The papers are necessarily brief, but in general they are well written from the standpoint of the respective authors. Most, but not all, of the labor leaders who take part are opposed to the incorporation of trade unions. Mr. Samuel Gompers tells us that there is already a law of Congress for such incorporation if the unions desire to avail themselves of it. He advises that they should not do so, although he thinks that the men who caused it to be enacted thought that they were doing a real service to organized labor. He thinks that the judiciary is often prejudiced against labor organizations, and that if the latter had money within reach of an execution issued from the bench, they would suffer in damages oftener than they do now. Mr. Henry White, General Secretary of the Garment Workers, concurs in this view. On the other hand, Mr. Henry Grossman, President of the Ladies' Garment Workers' Union, tells us that his organization actually is incorporated, and has found it much easier to defeat claims of employers for damages caused by members than other trade unions not incorporated. This experience bears out the opinion of Mr. Miller of the Chicago Building Council already cited. Mr. E. E. Clark of the Railway Conductors' Order is not disposed to take a stand either for or against the incorporation of trade unions, but is against compulsory incorporation.

On the latter question Mr. Levi Mayer, general counsel of the Illinois Manufacturers' Association, maintains that a trade union cannot be forced to incorporate. In support of his views he quotes Chancellor Kent and several court decisions, and Angell & Ames on Corporations. But if they could be thus forced, he holds that incorporation would not make the members of a union more responsible than they are at present, except as the union might possess property. Plainly the mere act of incorporation of a body of men united not for the purpose of pecuniary profit would not ordinarily create any more financial responsibility than previously existed, on the part of the individuals composing it.

Mr. F. H. Cook, attorney-at-law, New York, points out that under the law of this State an unincorporated society of seven or more persons may be sued in the name of its president or treasurer, and that the judgment so obtained binds the property of the society. Therefore, the principle of the Taff Vale decision already prevails here. Mr. F. J. Stimson of Boston, author of 'Government by Injunction,' agrees that the Taff Vale decision lays down no new principle of law. In this view Mr. John De Witt Warner concurs. He does not, however, advise trade unions to incorporate. Mr. John Brooks Leavitt, on the other hand, does so advise. His reason is, that he thinks that incorporation would have a steadying influence upon the unions and bring their most conservative and cool-headed men to the front. The Taff Vale decision, he says, "simply applied to labor organizations the same law which has, for many years, been appplied to other unincorporated bodies." Professor Farnam of Yale is of the opinion that incorporation would add to the feeling of responsibility which the leaders would be governed by, and would be desirable in that sense. President Eliot is not in favor of compulsory incorporation of trade unions, even if it were feasible, because incorporation is essentially a privilege and not a duty.

COPYRIGHT IMPROVEMENT.

In the current number of the *American Law Review* is printed the address recently delivered before the Maine State Bar Association by Mr. Samuel J. Elder of Boston, on what he styles "Our

Archaic Copyright Laws." Mr. Elder points out many directions in which he believes our present copyright statutes should be amended. The substitution of a single term of protection for the present double term is recommended in order to do away with the requirement of a second registration of title and deposit of copies, and with the opportunities which the renewal term offers for unnecessary and delicate complications between the author and his assignee. A longer period of protection, also, is favored, and it is pointed out that Mr. Edward Everett Hale has already outlived the copyright of some of his earlier works, and that James Russell Lowell's earliest copyrights expired during his lifetime. The English method, Mr. Elder thinks, is preferable, namely, to grant protection during the life of the author and for seven years beyond, or for forty-two years from first publication—whichever is the longer term.

A simplification of the procedure as regards registration and deposit in the case of newspapers is advocated, and the protection, which should be secured by the fact of publication alone, "ought to be temporarily extended beyond the mere language in which the news is stated." As great expense is incurred by the Press Association and individual papers in procuring news, "the news itself, the facts stated, should be protected, and not merely the literary vehicle in which it is conveyed," but only for a brief period of time; the public should be entitled shortly after publication to the full use of all news material. Improved legislation taking into account the natural differentiation between books and plays is advocated; and the penal clauses for unlawful representation, involving possible imprisonment, are deprecated and ascribed to the influence of the "theatrical trust." The general lack of harmony in the provisions of the statutes as to infringement and the penalties imposed are dwelt upon, and it is insisted that "the whole system, in the light of its interpretation by the courts, calls for revision."

Mr. Elder has concerned himself mainly, however, with the statutory formalities upon exact compliance with which, under the provisions of our laws, copyright protection rests. He traces the development of these from the English act of Queen Anne (1709) through the copyright legislation of the original States and the various Federal enactments to date, showing how the formalities of registration of title, deposit of copies, and printing of copyright notice have become conditions precedent to obtaining and maintaining the copyright; and he inveighs against these provisions as "so many traps for the feet of the unwary," by which "the person entitled to be secured may be deprived of all protection by the most trifling slip for which he may not be, and usually is not, in any degree responsible." Notable examples are given of cases involving the loss of copyright protection under the decisions of the courts, by reason of failure to comply exactly with the statutes as to registration, deposit of copies, and proper printing of the notice of copyright. Thus, in the case of the 'Autocrat of the Breakfast Table,' the copyright was lost because it could not be proved that copies of the *Atlantic Monthly* in which it first appeared were duly deposited. The copies of Gottsberger's expensive edition of 'The Ebers Gallery' (sold at about sixty dollars) were detained in the express office until the express charges could be collected, and hence not delivered at the Library of Congress within the statutory time, and this delay led to the loss of the copyright. The misprinting of the year date by a single year in the notice of copyright has been held to invalidate the right. The printing of Mrs. Stowe's 'The Minister's Wooing' with a notice of copyright in the author's name before the last chapters of the book appeared in a number of the *Atlantic Monthly* bearing notice of copyright in the name of the publishers, was held to constitute a variance which created a fatal defect. On the other hand, 'The Professor at the Breakfast Table' having been brought to completion in the *Atlantic Monthly* which contained a notice of copyright in the name of the publishers, subsequent publication of the work with a notice of copyright in the name of the author was held to be equally fatal. In effect, an author may be entirely at the mercy of a mailing clerk in some publisher's office, so that if the title is overlooked and does not reach the copyright office before publication, the work of years may lose protection, while the failure of a shipping clerk to see that the copies of the book go seasonably forward to Washington may destroy a publishing right of great value. "It is absurd and wicked," Mr. Elder exclaims, "that a slip of a clerk or binder, or a mistake of the author, publisher, or printer, should utterly destroy all copyright protection!"

The additional prerequisite that books copyrighted must be "printed from type set within the limits of the United States, or from plates made therefrom," Mr. Elder explains, was inserted in the International Copyright bill because it could not be passed without this proviso. The opposition of the typographical unions throughout the country, which feared that the proposed legislation might transfer the setting up and printing of many books to foreign countries, would have been fatal to the passage of the act. The agitation for international copyright had continued fifty years without success, and it was thought best by nearly all friends of the cause to yield the point rather than lose the measure. He acknowledges that much severe criticism has been made upon this part of the act, and, by way of exemplifying the ground of such criticism, states that a recent publication which had been set up and printed in England entailed an expense of upwards of $40,000 for resetting and electrotyping in this country. "The American market, however, is so vast and so profitable," according to Mr. Elder, "that the expense is not prohibitive," and it is now, at all events, he concludes, "too late to consider any change in that branch of the statute."

His conclusions may be thus summarized: that there is need of revision and simplification of the law of literary and artistic property; that as it is the securing of an existing right, and not the creating of a new one, for which the law makes provision, as a corollary the law should liberally protect and not fetter, hamper, or in any case defeat the right. "The basis on which our copyright provisions rest is erroneous. It being true that the author's right of property results from his labor, genius, and ingenuity, and that protection was intended to be secured to him because of his dedication of his work to the public, there is no reason why the security itself should be imperilled by a variety of technicalities, or why the value of the work should be frittered away in litigation on questions which have nothing to do with the real work of ownership." Finally, Mr. Elder contends that "the law requires adaptation to modern conditions. It is no longer possible to summarize it in a few sections covering every thing copyrightable. It should be revised so that protection to the honest literary worker, artist, or designer shall be simple and certain."

THE NATIONAL ACADEMY MEETING.

WASHINGTON, April 23, 1903.

The session of the National Academy of Sciences, which has just been brought to a close, has been one of unusually varied interest. From the point of view of utility to human life, the most important paper was one by Dr. Weir Mitchell, in which he announced the acquisition of an antidote to the poison of the rattlesnake. It was many years ago that Dr. Mitchell originated the theory, soon demonstrated by himself and Dr. Reuchert, that the venoms of the cobra and of the rattlesnake, though they appear at first sight to be as different as possible in their effects, have the same qualitative composition. The bite of the cobra is almost always promptly fatal, without much local soreness or swelling. The victim dies before any such symptoms can manifest themselves. The bite of the rattlesnake is not usually fatal; but frightful swelling ensues, followed by a breaking down of the health, from which the person may not recover for years, or not at all—phenomena only too well known in those parts of our country where the *Crotalus* abounds. Yet both venoms are mixtures of the same two in different proportions. One of these is a nerve poison, acting, roughly

speaking, like strychnine. If it does not kill promptly, its effects pass off, the matter is eliminated from the system, and that is the end of it. This constitutes nine-tenths of the cobra venom. An antidote for it has been known for some time. The other constituent, which is predominant in the poison of the rattlesnake, acts like a zymotic poison, dissolves some of the fine tissues of the blood cells and its vessels, and in particular destroys the resistance of the blood to bacterial poisons generally. It does not kill at once, but brings about fearful lesions, and lays the system open to all sorts of malignant influences. It is against this poison that Dr. Flexner of Philadelphia, a well-known student of Dr. Weir Mitchell, has succeeded in finding a protective serum which has been tested upon guinea-pigs and other animals, and whose practical efficacy has been demonstrated.

Of a widely different kind of practical interest was a paper by Mr. Alexander Graham Bell, describing an invention applicable particularly to the construction of kites. The idea seems to have been a corollary from a remark of Professor Newcomb to the effect that since the weight of a flying machine of given shape would be proportional to the cube of a linear dimension, while the area of the supporting planes would be proportional to the square only of that dimension, the smaller a flying machine of given shape, the greater would be its proportional lifting-power. From this it would seem to follow that a flying machine or a kite ought to be built up of small independent elements. In order to obtain the greatest three-dimensional stability, the eminent inventor gives to each of the elements out of which the structure of a kite is to be built up the form of a regular tetrahedron or triangular pyramid, formed of six equal bars. He calls attention to this tetrahedral form of elementary framework as recommending itself by its extraordinary stiffness and lightness, not merely for kites, but wherever framework is to be used. It would certainly seem to merit the attention of engineers. Mr. Bell forms a larger tetrahedral element of structure by connecting four such tetrahedral frames so that their bars shall be parallel, leaving an octahedral vacancy between them; and with numbers of such larger tetrahedra he builds various kinds of structures for which lightness and three-dimensional stiffness are needed. In particular, by stretching membranes over all the small triangles that are parallel to two of the triangles of one of the smallest elements, he obtains a kite which experience has proved to be a very light flyer. Photographs were exhibited showing kites built up in several ways from such elements, and in actual flight.

Two distinct studies, of which accounts were given, seem to have been provoked chiefly by the extreme discordances which different determinations of melting-points often show. One of these, by the celebrated chemist, Prof. J. M. Crafts, had been directed towards a more accurate method for the measurement of temperatures up to about 400° C. The proposal was to observe directly the vapor tension of naphthalene, which boils at 218° C., of benzophenone, which boils at 306° C., or of mercury, which boils at 360° C., according to the temperature whose ascertainment might be desired. This method would require, as a preliminary, a very accurate series of experiments to be made, once for all, in order to ascertain the tensions of those vapors at different temperatures. The other study, by Mr. Arthur L. Day, who was introduced by Dr. Becker, and who explained the matter with admirable perspicuity and most agreeable delivery, related to the phenomena of the heating and cooling of anhydrous borax, as the beginning of an investigation into the melting-points of rock-forming minerals.

It appears that if a body with a sharply definite melting-point, such as silver, be allowed to cool, under constant conditions, from a temperature considerably above the melting-point, the cooling proceeds regularly, though at a slightly diminishing rate, until solidification sets in, when its temperature suddenly becomes fixed until the entire mass is solidified; after which the cooling begins again at somewhat the same rate as before. Analogous phenomena are observed when the body is heated from the solid condition. But when borax melted to a thin liquid is allowed to cool to a glass, the only hitherto known form of solid anhydrous borax, the cooling is continuous and without any particular irregularity from beginning to end, the heat of solidification being gradually evolved as the borax cools; and the same phenomenon appears when the glass is melted. If, however, the molten borax during the process of cooling, and while at any temperature between 741° C. and 490° C., be jarred or subjected to other influences which usually induce crystallization, a very marked retardation of the cooling will at once ensue, no matter at what temperature between those limits the jarring or whatever agency it be takes place; and what results after the cooling will be found to consist of a mass of crystals, a hitherto unknown form of this salt. If, now, anhydrous borax in this new crystalline form be heated again, it will be found to behave like silver, having a perfectly definite melting-point at 741° C. Quietly cooled, it will be reconverted into the vitreous form, or, if sufficiently shaken at any point below the melting-point of the crystalline form and above 490°C., it can be recrystallized. Below the latter temperature the vitreous form becomes incapable of crystallization by any means that could be employed. These facts suggest a probable explanation of the discrepancies in the observed melting-points of rock-forming minerals, although there is no reason to suppose that all the large disagreements in determinations of melting-points are thus to be accounted for.

Prof. Crafts gave, besides, another instalment of his researches into the catalysis of concentrated solutions—researches which ought to excite a lively interest among the higher physicists, and doubtless do so. Two other chemical papers were extremely interesting. One of these, it is true, was merely historical, being an account, by Professor Barker, of the researches of the late Mathew Carey Lea chiefly into the mode of action of light in photography, showing how patience and genius had, after a long chase of elusive facts, finally led that admirable chemist to run down the so-called photosalts. Some beautiful specimens of Carey Lea's allotropic silver prepared by him were shown at the meeting. Pure silver of the color of gold, and pure silver approaching the color of copper, are very suggestive sights in view of the chemical relationship of these three metals; silver being intermediate between the other two in chemistry as it is in trade. There was also a whole sunset of gradations between the golden-colored silver and a soluble silver of a purple hue. Another paper by Prof. Barker refuted last year's assertion of Hoffmann and Zerbann that thorium owes its radioactivity (or unceasing emanation of peculiar rays) to admixtures of uranium, thus advancing our understanding of that subject by one essential step. But the interest of this particular point was quite absorbed in that of Dr. Barker's clear account of the whole history of research into radioactivity, beginning with the discovery of the Becquerel rays in 1896.

It appears that the radioactive elements are four: thorium (which has the highest atomic weight of any known element), radium (whose atomic weight has been ascertained to be about 225), polonium, and actinium (both of unknown atomic weights). Specimens of the salts of the first three were exhibited. Actinium has never gone out of the laboratory, where alone it has been found. The radiations of these bodies are of three different kinds. The simplest, known as the β-rays, consist of those particles a thousand of which are said to compose an atom of hydrogen. They are shot out with a velocity of the same order as that of the propagation of light, and are charged with negative electricity. Others, known as the α-rays, consist of relatively large and heavy particles, of slower motion and positively charged. The third kind, known as the γ-rays are remarkable for their penetrative power, their intensity not being reduced as much as one-half by passing through three inches of metallic aluminium. In some of the exhibits they had so shone through a brass stencil-plate that the letters could not be made out on the photographs. The radiations are all invisible, but there are two ways of recognizing them. They can be photographed, and, by rendering the air a conductor of electricity, they discharge any pair of oppositely charged bodies between which they pass in a suitable way. Two of the radioactive bodies—to wit, radium and thorium—seem to emit effluvia, which have the property of rendering any bodies they reach radioactive; so that, after a long course of experimentation, Professor and Mme. Curie found that the furniture of the room and even their own persons had become so radioactive that it was impossible to make any use of an electroscope, and their work had to be suspended. Polonium has no such power of exciting secondary radioactivity; nor has uranium. Professor Barker exhibited photographs which, in view of the circumstances under which they were taken, conclusively proved thorium to be primarily radioactive when entirely free from uranium.

Of the remaining papers, the one most generally interesting was that of Mr. George E. Hale of the Yerkes Observatory, giving an account of his work with his spectro-heliograph, for which the Academy at this meeting voted him the Draper medal, and for which he received this month the Rumford medal of the Boston Academy. It would be impossible to give much idea of this elaborate work without fine engrav-

ings, for which we can only refer to the magazines; they will doubtless do justice to it. We must limit ourselves to saying that Dr. Hale has found means to photograph, all over the face of the sun, a particular stratum, or rather two distinct strata, of the lower part of the chromosphere, which is that outer rind of the sun whose splashes or eruptions, whichever they may be, produce the red prominences visible to the naked eye in total eclipses.

A paper by Mr. Lewis Boss, a model of skilful manipulation of a vast mass of numerical data, showed precisely the effect of differences of brightness of stars in accelerating or retarding the observed times of their transits. A very elaborate and meritorious study of the tides of the northern Indian ocean, by Mr. R. A. Harris of the Coast and Geodetic Survey, who was introduced by Prof. Cleveland Abbe, gave evidence that the Survey, under its present management, is not forgetting the obligations entailed upon it by its scientific past. *Noblesse oblige.* The reading of a biographical memoir of T. E. Holbrook by Dr. Theodore Gill, the eminent ichthyologist, closed the proceedings very appropriately with a handshake between science and human life. Dr. Holbrook was a South Carolinian, who died at a good age during the war of the Rebellion. He was an ichthyologist of the finest scientific quality, well known to Louis Agassiz, to Jeffries Wyman and a few more, but known to very few even of the scientific world. Forty years after his death the National Academy reads, as it were, the "Siste, viator," and drops a tear over the monument that Dr. Gill sets up over him. As usual, in the hurry of the meeting, a number of good papers went unread.

The Academy added five regular members to their number: Chamberlin of Chicago, geologist; James of Harvard, psychologist; Thurston of Cornell, engineer; Webster of Clark University, mathematical physicist; and Mark of Harvard, biologist. It also elected the following foreign associates: Picard of Paris, Marey of Paris, Backlund of Pulkova, J. J. Thomson of Cambridge, Brögger of Christiania, Ray Lankester of London, Vogel of Potsdam, Pfeffer of Leyden, Mendeléef of Petersburg, Zirkel, the petrographer, and Koch of Berlin. The next meeting will be held in Chicago, beginning November 17.

THE AMERICAN ORIENTAL SOCIETY.

April 22, 1903.

To present and discuss in little more than twelve hours nearly sixty papers, to the reading of each of which were alloted fifteen minutes, was the awkward task set before the Oriental Society at its one hundred and fifteenth meeting, held in Baltimore on the 16th-18th of this month. As was to be expected, some of the papers took more than the scanty measure of time allowed, some were read by title or were briefly described, and some were good-naturedly suppressed. What wealth of wisdom was contained in those thus withdrawn will be discovered when they are printed. To sketch even cursorily the contents of those actually presented requires all the space that can be given to the present report of the meeting. The Society, not being distracted by rival attractions, such as at times disturb associations meeting in the hurly-burly week of festivities and general convocation, held together, and the sessions, five in number, were well attended. A very agreeable feature was the intrusion of an informal sixth session (in the shape of a luncheon and smoker at the house of President Gilman) between the formal morning and afternoon sessions of the second day. The hospitality of the University itself, of the Johns Hopkins and University Clubs, and of private hosts, added to the comfort of the unusually large number of attending members, while the weather, at first anything but oriental, became at last almost springlike. So persuasive were the sun and the voice of the pleader that the Society indulged for the first time in the amusement of being photographed; though some point was given to this performance by the recollection that the picture would serve as a memorial of the Society's sixtieth birthday. For the A. O. S. is almost the oldest "learned body" in this country. Apropos of these facts, it is pertinent, by the way, to bring to the attention of the public the action of a book-selling concern in New York, which calls itself "The Oriental Society," and sends out advertising letters signed by "The Oriental Society, F. Cooper, Secretary." It also gives itself the title "Oriental Society of London," and may be a bona-fide English society, though it appears to be merely a business firm. It has, of course, no connection with the American Oriental Society.

Of the fifty-nine papers presented in one way or another, those on Semitic subjects were in the majority, and several of these touched on topics more or less familiar to the laity. Hammurabi and Moses, the former recently introduced to the public by the German Emperor, furnished the subject-matter of two independent papers by Professor Jastrow and Professor Johnston, respectively. The latter scholar instanced the similar phraseology of the *lex talionis* in the codes of both lawgivers, and from this and similar parallels concluded that, as Israel passed from a nomadic state into the condition of a settled people in a district under the influence of Hammurabi, there could be as little doubt whence the Hebrews got their code as there is in regard to the source of their myths. Professor Jastrow set the date of Hammurabi at *c.* 2250 B. C., the definitive character of this date being especially important in view of the recent rehabilitation of other dates before and after this epoch. Nine hundred to a thousand years are now cut off from periods assumed as certain a decade ago. Professor Jastrow inclined to the opinion that the influence exerted upon the pentateuchal code was less specifically Hammurabi's than generally Babylonian. Courts of procedure and an established legal system must have existed before Hammurabi. But the latter's code, in its cruelty and in other regards, is more antique than that of Moses. In the discussion that followed, Dr. Ward expressed the opinion that Hammurabi unified not the religious, but the civil law. Dr. Ward himself contributed a paper on representations of Ea and Shamash. In identifying Babylonian gods, there are certain types easily recognized, while others are obscure. A seated god with a notched sword and with rays coming from the shoulders is the sun-god Shamash; a god not seated, but standing, with streams of water, may represent Ea, the god of water and wisdom.

Of more esoteric character was an exhaustive paper by Professor Moore on the liver in sacrifice. The importance of the *caput* in divination was shown, and the relation of the parts of the liver was sketched in diagrams. Besides other more technical Semitic papers—by Professor Hyvernat, on the interpretation of Genesis vi. 14; by Dr. Arnold, on a Hebrew phrase; by the Rev. Mr. McPherson, on Is. xxviii. 25 (*sôrah* and *nismân* as kinds of grain), and by others—Professor Price described a pearl cylinder of 2000 B. C.; Professor Torrey exhibited some Jewish inscribed weights from Jerusalem; Dr. Bliss, recently returned from Beirut, spoke of six jar handles (*c.* 650 B. C.) marked with royal stamps and discovered by him in Palestine; Professor Prince gave a translation of the Sumerian Belit hymn, K. 257, than which, in his opinion, "there is no better example of henotheism merging into monotheism"; and Professor Haupt, in a paper on David's dirge on the death of Saul and Jonathan, maintained that there were no pre-exilic hymns and no real psalms of David.

An important paper on religious development was that of Professor Jastrow on the national Assyrian god Ashur. Hammurabi's code speaks only of protecting deities restored to the city of A-usar, the god not being named, which indicates that this title originally referred to the district. On the other hand, *ashur* (meaning 'beneficent' or 'saviour') was originally an epithet of the god who was contributed to the Babylonian pantheon by Assyria, where, in contrast to the Babylonian triad, Anu, Bel, Ea, this divine lord paramount made for monotheism. Possibly in Babylon there was a confusion between the form of this name and that of *asari*, Marduk. This was one of the papers read at the Friday afternoon session, devoted to comparative religion. The first place on this occasion was given to the maiden effort of a new member, Miss Margaretta Morris of Philadelphia, who, in a rapid survey, discussed the development of religion from the point of view of sociology, her theme being that the idealization of the useful explains religious modifications. Dr. Gilman, who at this meeting was for the tenth time reëlected President of the Society, spoke the same afternoon on aspects of the archæological researches proposed to the Carnegie Institution, and mentioned that several scholars, among them Prof. Seymour in the interest of Greek archæology, were already afield for preliminary surveys of work which hereafter might be aided by the Carnegie Institution. In conclusion he remarked that the funds of the Institution were not sufficient to carry out half the plans submitted to it by various other institutions, and begged the public to have patience, and remember that every plan of work must be carefully considered before action was taken.

On the same afternoon was read a letter from Professor Jackson, written in Persia, on local devil-worship, a few first-hand additions to what was previously known about the Yezîdîs; and the Rev. Mr. Oussani described the mourning rites of Arabia. A curious link between the Middle Ages and the present was suggested by the former American Consul at Bagdad, Dr. Sundberg, who gave from personal experience an account of the Salibiyeh, a little known

tribe of the Arabian desert. Dr. Sundberg made friends with them years ago. He reports that they are the only tribe whose music is European in character, and what they call their "mark" is the cross, though they attach no meaning to the symbol. Their traditions point to their being aliens who came from afar, and Dr. Sundberg believes that they are the last remnants of stranded Crusaders. They refuse to drink coffee, "because they might learn to like it, and then, failing to obtain it, would be the more unhappy." Professor Haupt concluded the "religions session" with a paper on Bible and Babel, pointing out that Delitzsch's famous address contained nothing new, and that only the Emperor's own interest in the subject gave the matter its present prominence. Professor Haupt took the usual conservative attitude of the devout scholar who, undismayed by the results of higher criticism—a term objected to by the Rev. Mr. Ramsey, who offered as a substitute "genetic criticism"—believes that the question of *Prioritätsrecht* is not one to disturb the Christian. The source of Biblical mythology—the cherubim, for example, being originally storm and winds, as the seraphim are serpentine lightning-flashes — does not really affect that which is essential in religion; a view that seemed to give the usual satisfaction afforded by this convenient expression.

Professor Prince's review of recent excavations in Babylon was perhaps the most drastic paper ever read before the Society, which as a rule expresses a difference of opinion in notes sedulously attuned to universal harmony. Yet in this case also there was no lack of unanimity; only it was voiced in emphatic disapprobation of the recently published work called 'Explorations in Bible Lands,' which Professor Prince stigmatized as unfair in so many particulars as to necessitate public correction. The author of this book, Professor Hilprecht, ignores, or mentions only with haughty contempt, the good work of scholars who preceded him, and in ridiculing his former superior violates every canon of scientific criticism. What is valuable in his book, said Professor Prince, is so buried under egotism as not to be recognizable. Professor Price fully endorsed this expression of opinion, and Professor Moore summed up the general condemnation in the sentence: "It is a book no American can read without being ashamed." After this the Society took a rest, and enjoyed the lunch and smoker at President Gilman's, where American relations with the Orient were informally discussed by scholars well able to throw light on several interesting points, not the least of which was the question of the present attitude of the Vatican toward American control in the Philippines. Without violating the confidential character of the remarks made, it may be said that the recently appointed rector of the Catholic University of America expressed it as his opinion that no better man than Judge Taft could be found for the work to be done in the Philippines. "Broad-minded and conciliatory," he is just the man for the place, and affairs there "are adjusting themselves in a perfectly satisfactory manner."

Apropos of our islands, linguistic papers on Tagálog were not lacking at this meeting. One, by Dr. Blake, discussed Sanskrit words in Tagálog; and one, by Mr. Seiple, treated of Tagálog numerals; while Dr. Scott dissected the languages of the Philippines and gave a list of Philippine words in English. Dr. Blake instanced as a curious corruption *lingo*, 'week,' from *domingo* (Sunday), and derived Manila from *nīla* (Sanskrit, 'dark blue'), 'indigo-trees,' and *may*, 'having.' The Sanskrit word for poet, *kavi*, means 'jargon' in Tagálog! Before adjourning, the Society appointed Dr. Gilman, Mr. Rockhill, and others a committee to make to the President of the United States such representation as they may think proper concerning the survey of the Philippine Islands.

Contributions on the Sanskrit side were offered by several members. Professor Lanman presented to the society a finished copy of the annotated Atharva Veda, long ago begun by Professor Whitney. At the close of his commemorative address, others expressed appreciation of Professor Lanman's own expenditure of strength and time on the elaboration and perfection of this work. Professor Whitney left a complete translation of the Veda, and it might have been published at once. The value of this, however, Professor Lanman has greatly enhanced by adding a very complete critical apparatus. A description of the first book of the same Veda, according to the Kashmir text lately photographed (as described in the report of the last meeting), was presented by Mr. Barret, while Professor Bloomfield, in a paper on the genesis of the Sāma Veda, defended the thesis that the Sāman owes its ejaculatory characteristics to its Shamanistic nature, the latter being a hypothesis based on Oldenberg's hypothesis of the ogre-origin of Indra. The temporal ablative in Sanskrit formed the subject of an investigation by Professor Hopkins into the real value of the temporal character of cases in Vedic and Epic Sanskrit. Indo-European philology was represented by two papers, one by Professor Collitz on the status of the *ā*-declension, which he derived from an *āy*-type, thus being enabled to draw a parallel to the earlier (Vedic) *ī*-declension. Stated in terms of classical philology, this is equivalent to deriving the first Latin declension from the fifth; but Professor Collitz's contention affects only the pro-ethnic forms. Another Indo-European paper was presented by Professor Oertel, who combated the conclusions of Knudtzon, recently reviewed in the *Nation* (March 5), contending that the evidence was insufficient to warrant the assumption of the "Arzawa language" being either Indo-European or Semitic, and that the former was certainly not represented on the Tel el-Amarna tablets.

So this report is brought around to Egypt, represented at the meeting by papers on Egyptian stone implements and the transliteration of Egyptian by Mr. J. T. Dennis, and on recent papyrus finds in Egypt by Mr. Seiple; while Coptic words in modern Egyptian Arabic were discussed by Dr. Littmann. China was not on the programme, but, as Professor Hirth was elected a member of the Society, it may be hoped that before long this deficiency in the annual list of papers may be made good. After an exceptionally pleasant meeting the Society adjourned, to meet again on April 7, 1904, in Washington, D. C.

MADAME DE STAËL AND NAPOLEON. —III.

PARIS, April 9, 1903.

We left Mme. de Staël in Vienna. Before returning to Coppet, in the beginning of 1808, she made a pilgrimage to Weimar. How changed she found everything! Weimar had been pillaged; the Grand Duke had been forced to enter the Confederation of the Rhine, and to pay a war contribution of 2,200,000 francs; the Grand Duchess, worn with emotion, was ill; Schiller was dead. Mme. de Staël had more personal troubles: she found in Switzerland Benjamin Constant married to Charlotte von Hardenberg, who, having lost her first husband and divorced the second, had chosen Constant for her third. She was neither handsome, nor intelligent, nor virtuous.

Auguste de Staël, who was only seventeen years old, made a visit to Napoleon at Chambéry, in order to obtain for his mother permission to go to Paris. The Emperor received him kindly, talked with him for nearly an hour, and told him that he looked upon his mother as a woman "who was accustomed to no sort of subordination," and he meant above all to be obeyed. In Paris, she could not help "making pleasantries." "She attaches no importance to them, but I do; I take everything seriously. Your mother would not be six months in Paris before I should be forced to send her to Bicêtre or to the Temple; I should be sorry to do that, for it would make some noise, and it would hurt me a little in public opinion." He added that, with the exception of Paris, she could go wherever she liked. "It is only your mother who finds herself unhappy when all Europe is left to her." In reality, in 1808, she could not travel easily, and was obliged to remain at Coppet.

A great movement was beginning in Europe, tending to a coalition against Napoleon; the Spanish war was the turning of the tide. Madame de Staël was under the eye of the French police; her friends hardly dared to make her rare visits. She felt so unhappy that at one time she resolved to go to America with her son Auguste. In April, 1810, she left Coppet with a passport for the United States; she went to Lyons, where she saw Camille Jordan, and from there to the Château de Chaumont, on the Loire, where she stayed, waiting for the proprietor, M. Le Ray, who was on his way from America. At Chaumont, Madame de Staël was soon surrounded by a sort of court—Mathieu de Montmorency, Elzéar de Sabran, Barante, Schlegel, Benjamin Constant, Mme. Récamier; she invited many people to come and see her. When she paid an occasional visit to Blois, people stood before the door to get a sight of the famous woman. When M. Le Ray, the proprietor of Chaumont, came back, she left Chaumont and went to the Château de Fossé, where, unconscious of danger, she corrected the proofs of her book on Germany. She was very happy there with Madame Récamier, and renounced the idea of going to America.

From Fossé she went to a house near Blois belonging to her friend, Mathieu de Montmorency. It was there that she received the order, signed by the Duke de Rovigo (who had replaced Fouché in the Ministry of Police), to leave, within forty-eight hours, either for Geneva or for Coppet, or

for a seaport where she could take passage for America. The prefect who executed the will of the Duke de Rovigo had also orders to take possession of the manuscript and the proof sheets of 'L'Allemagne.' Whatever was ready for publication was at the same time seized in the house of her publisher in Paris, Nicolle. The manuscript was saved by Auguste de Staël, a few hours before it was to be seized. Madame de Staël was away when the order of exile came; the prefect, M. de Corbigny, allowed her a few days in which to make her preparations. Madame de Staël, who always hoped against hope, tried again to use the influence of her numerous friends. She asked for an audience of the Emperor, which was peremptorily refused. Napoleon would not believe in the submission of Madame de Staël, and answered those who promised it with the Italian proverb, "Passato il pericolo, gabbato il santo."

Madame de Staël took again the road to Coppet. The real reason of her exile was the fear which was felt of her book, 'L'Allemagne.' Every precaution was taken to prevent its publication.

"The book," says M. Paul Gautier, "in the thought of its author essentially a weapon, political as much as literary, a hardly concealed attack against the Empire, against the spirit of the Empire, against the France of the Empire; a generous book, full of pity for the oppressed, of hatred against the oppressor, animated by the purest and highest sentiments; novel in many respects, abounding in observation, in fine and exact details on the German character, on German literature; a book also of candid enthusiasm, full of grave errors and strange illusions on the state of Germany at the time, on the true nature of the Germans, their patriotism, their spirit of revenge, their hatred, on all those dangerous forces which the author does not seem to suspect and the explosion of which was so near; a book, in short, of which all the tendencies, moral, social, political, literary even, were made to shock, to irritate Napoleon—such is the 'De l'Allemagne' of Madame de Staël. It remains the most audacious monument which has been opposed to the power of a man, against the spirit of that man."

On her return to Coppet, in the last days of October, 1810, Madame de Staël entered into a sort of mystic phase; she made the acquaintance of Madame de Krüdener, of Zacharias Werner, who was preaching the "religion of holy love." She kept up, however, a sort of perpetual warfare with Capelle, the prefect of Geneva, who had replaced the amiable Barante. Capelle became afterwards a minister of Charles X., but he was a severe imperialist in 1810. Madame Récamier, who tried to see her friend, was exiled herself. M. de Montmorency was not allowed to go to Coppet. All the letters addressed to Madame de Staël were opened.

It was at the end of 1810 that Madame de Staël made the acquaintance at Geneva of a young officer, Jean Rocca, who belonged to an old Italian family which had established itself in Switzerland. Rocca had served in the Peninsular campaign, and had been severely wounded. He was handsome, and had about him something romantic; he was only twenty-three years old. Madame de Staël, who was already forty-four years old, fell in love with him. Rocca returned her affection, and they were married in secret, as she wished to preserve her name; they were even twice married—the first time at Coppet, the second time in Sweden. On the 17th of April, 1812, Madame de Staël gave birth to a child, a boy; the *liaison* with Rocca could no longer be concealed. The scandal was such that she left Coppet with Rocca, her daughter Albertine, and her eldest son, Auguste. The newly born child was confided to the care of a doctor, at Longirod, in the Jura. She went to Vienna, to Moravia, to Galicia, to Moscow. She wrote afterwards the details of her journey in 'Dix Ans d'Exil.' From Moscow she went to St. Petersburg, where she was triumphantly received. She there made the acquaintance of the famous Stein. She had two long interviews with the Emperor Alexander, and conversed with him on the interests of Europe. They talked on constitutional subjects, and, in her usual enthusiastic mood, she exclaimed, "Sire, your character is worth a constitution to your empire." Alexander answered her modestly: "If it were so, it would only be a happy accident." Alexander spoke to her with favor of Bernadotte, the "royal Prince of Sweden," knowing well that his words would not be lost. Alexander had twenty thousand men in Finland, and wished to join them to his army; but he desired at the same time to be guaranteed against aggression on the part of Sweden.

Madame de Staël arrived at Stockholm on September 24, 1812. A common hatred united her and Bernadotte; they had once together plotted against Napoleon when he was First Consul. Madame de Staël flattered the vanity of Bernadotte, calling him "the *true* hero of the century." She persuaded him that he alone could stop the Emperor in his career; that he might become the arbiter of Europe. She wrote a pamphlet which was published at Hamburg anonymously under the title, 'On the Continental System and its Relations with Sweden.' Schlegel accepted the paternity of the work, which was republished under his name, but there is little doubt that Madame de Staël was the real author. On the 20th of April, 1813, Bernadotte left for Stralsund, the headquarters of the Army of the North, accompanied by Schlegel and Albert de Staël, whom he had taken for aide-de-camp. Madame de Staël left for England with Auguste de Staël and Rocca. She was received with enthusiasm, and her salon was soon filled with members of the highest society. Everybody wished to see the great enemy of Napoleon—the Prince-Regent, the Queen, the Duchess of York, the Duke of Gloucester, Lords Lansdowne, Grey, Liverpool, Erskine, Wellesley, Holland, Byron, Castlereagh. She could not accustom herself to English life; she wrote to Schlegel: "You must be of this country to prefer it to all others."

The time was near when the power of Napoleon was to come to its end. The allies had crossed the Rhine, and France was invaded. Let us do justice to Madame de Staël: she did not triumph with the triumphant allies. She writes eloquently to Benjamin Constant: "Don't you see the danger of France? . . . I am like Gustavus Vasa: I have attacked Christian, but they have placed my mother on the ramparts. Is it the moment to speak ill of the French when the flames of Moscow threaten Paris?" And she adds, "Let God banish me from France rather than that I should go back to it by the help of foreigners." She returned to Paris, however, in the spring of 1815, not with the help of the allies; but she found Paris occupied by Germans, Russians, and Cossacks. She was well received by Louis XVIII., though he did not much like her. She saw all the representative men of Europe, all her old friends. When the news of the landing of Napoleon arrived, she was thunderstruck, but she was not deceived as to the result of the Emperor's bold enterprise. She told Lavalette, who remarked that the distance was great from the Gulf of Jouan to the Tuileries, "He will arrive—he will arrive; he will be here in a few days. I have no illusions." She left at once for Coppet.

When she saw Benjamin Constant, La Fayette, Sismondi rally round Napoleon, who had convened the Chambers and offered constitutional guarantees to the nation, she became reassured. She declared herself satisfied with the Constitution. King Joseph presented her son Auguste to Napoleon, who received him with much kindness. After Waterloo she returned to Paris. A new life began for her. M. Gautier abandons her at that point, and gives in his concluding chapter a remarkable résumé of the long war between the all-powerful Emperor and the woman who was "the empress of thought." She was eminently the representative of those *idéologues* whom Napoleon detested, being himself essentially the man of action, as Emerson has called him in one of his famous essays. The glory of Madame de Staël was in her uncontrollable belief in an ideal of justice, of liberty. She was an enthusiast, and in the end her enthusiasm triumphed over the iron will of her adversary; for Napoleon was upset by moral as much as by material forces.

Correspondence.

"BLIZZARD."

To the Editor of The Nation:

Sir: In your issue of the 8th instant your correspondent, Mr. Matthews, calls for "examples of *blizzard* in any sense previous to 1880"; and I would refer him to the following extract from Dr. Craven's 'Prison Life of Jefferson Davis' (New York, 1866), given on page 13 of that book:

"He had ridden right in on top of the Sixth Connecticut regiment, and our boys had given him what we called 'a blizzard.'"

In my army days I have heard the same expression to denote a fearful volley of musketry, which was the sense in which my old comrade, Dr. Craven, used it.

Another instance of the use of the word—and much earlier—is found in the *Massachusetts Gazette*, November 7, 1765, where "the ship Blizard, Robert Davis, Commander," is mentioned, the name of the vessel being spelled with one "z." From the fact that it was applied to a ship, I infer that the word originated among sailors.

Samuel A. Green.

Massachusetts Historical Society,
Boston, April 21, 1903.

Notes.

The first volume of thirty-eight of Messrs. Scribners' "Library of Art" will be Charles Holroyd's 'Michael Angelo Buonarroti.' The same firm will publish 'Letters of a Diplomat's Wife,' by Mary King Waddington.

'Studies in Contemporary Biography' is

the altered title of Mr. James Bryce's volume of biographical sketches just issued by Macmillan Co., who now announce for October 2 the appearance of Morley's Life of Gladstone.

Houghton, Mifflin & Co. have nearly ready 'The Solar System,' by Percival Lowell.

John Lane will shortly publish 'Walks in New England,' by Charles Goodrich Whiting, with numerous full-page photographic illustrations.

The Council of the Bibliophile Society of Boston have determined to pass from their nine-volume edition of Horace to a four-volume reissue of Dibdin's 'The Bibliomania' (1809-1843), with much retrenchment and free handling. Mr. William P. Cutter of the Library of Congress will contribute a bibliographical study of the most memorable prices brought at auction or private sale of notable books during the past two centuries.

Lemcke & Buechner invite orders for a Greek-German School Dictionary compiled by Prof. Dr. Herman Menge, and offering some features more extensive and thoroughgoing than school dictionaries commonly possess. The range of the vocabulary will cover several standard anthologies and Wilamowitz-Möllendorff's 'Lesebuch.' The eight parts will cost 75 pfennigs each.

The first general convention of the International Association of Scientific Academies held in Paris in April, 1901, assigned to three of its members, the Académie des Sciences and the Académie des Sciences Morales et Politiques of Paris and the Berlin Royal Academy of Sciences, the preliminary labor for a complete edition of the works of Leibniz. They have reached the conviction that the manuscripts and the rarer editions of the great philosopher are not yet sufficiently known, and have accordingly published an appeal addressed to libraries, archives, and specialists in general to furnish further material and data for this international edition. A list of questions has been prepared for all who are willing to act. A full report is to be made by the three societies to the next general convention of the Academies to be held in London in 1904.

"The Fireside Dickens," conjointly in course of publication by Chapman & Hall and Henry Frowde, has a homely aspect consistent with its title. The letterpress makes a "plain tale," with large type somewhat compacted, and there is an equally unpretentious green cloth cover with a hearth stamped upon it. The original illustrations by Cruikshank, "Phiz," and others, are reproduced once more. The attraction lies in the price of these handy volumes, which are very cheap indeed. There are to be twenty-two of them, and already we have 'Pickwick,' 'Sketches by Boz,' and 'Oliver Twist.' They can be purchased separately.

The Dent-Macmillan Thackeray proceeds with 'The Irish Sketch Book' and 'The Yellowplush Papers,' still under Mr. Walter Jerrold's auspices, with Mr. Brock's clever illustrations, more happy, on the whole, on Irish than on English ground.

Miss Margaret Warner Morley's 'Down North and Up Along' (Dodd, Mead & Co.) well deserved the second edition it has obtained at the end of three years. It is the story of the journey of two women from Digby, N. S., to the northern extremity of Cape Breton, related graphically and with delightful humor, with intelligent observation of nature, and with an optimism which sees beauty even in the Annapolis and Minas Basins at low tide. The Cape Breton itinerary was mostly off the beaten track, and stamps the book with originality; but no district visited is slighted, and at Grand Pré some history and some pretty historical reverie are indulged in. We could wish that between the two editions the author had repaired her omission to stop off at Annapolis, and to cross to the north shore of the Basin for a nearer view of that fine country, especially if in quest of apples; and again, that she might have crossed North Mountain from Grand Pré to glimpse the Bay of Fundy and the modest bayside bathing resorts. Her laborious drive through the wilds of Cape Breton might well, we should think, tempt the horseman to an easier excursion. We heartily commend the book as an unconventional guide to a region quite accessible, still primitive, extremely healthful, and abounding in fine scenery and grand historic associations.

Prof. James A. Harrison's 'Life and Letters of Edgar Allan Poe' in two volumes (Crowell) was thoroughly reviewed by us at the time of its appearance with the "Virginia Edition" last fall. Since the memoirs contain a greater collection of Poeana than had previously appeared in a single work, it was desirable that they should be issued separately, as they now are, with all the facsimiles and illustrations.

The gruesomeness of the tales collected in Ambrose Bierce's 'Can Such Things Be?' (Washington: The Neale Publishing Co.) is associated with undeniable power of relation and visualization. The dead are always present, and, as usual with this writer, the battlefield is a favorite scene. There are some terrible war pictures in this volume, not Mr. Bierce's best in literary execution, but in line with his other work. His manner is perfectly quiet. "Some Christian soul," he says of the body of a Federal sergeant, "had covered it with a blanket, but when the night became pretty sharp a companion of the writer removed this, and we lay beneath it ourselves." "One Kind of Officer" is a good illustration of "War is hell."

'The History of Oregon: The Growth of an American State,' by Horace S. Lyman (New York: North Pacific Publishing Society), is a pretentious work in four volumes, patently defective at every point. It is prolix, poor and ungrammatical in style, destitute of grasp and sense of proportion, with no chronological landmarks at the head of the page or in the table of contents. The meagre index is not analytical. The opening sentences are orphic: "This history of Oregon is in response to a demand, as public events of great significance are approaching." The editor has tried "to group subjects so as to recognize the grand order of time; and also the conclusions of Providence." He has also held himself in: "With the rise and development of the United States as a whole we cannot linger here," he says at the beginning of volume ii.; but by a less praiseworthy forbearance he compresses the romance and drama of Oregon's railroad connection with the East within seven pages. In his lucid phraseology, "no minute, or even a general sketch of the labors and struggles, involving men and political parties, and developing all the excitements and even the hostilities of actual warfare, can be entered into here. This is a theme for the character student and the sociologist." Jay Cooke is ignored in text and index; and the queer bibliography for volumes iii. and iv. contains no mention of any work relating to the building of the Northern Pacific Railway. This is history with a vengeance.

The second and concluding volume of the 'Correspondence of the Colonial Governors of Rhode Island, 1723-1775,' published by the National Society of the Colonial Dames of America in the State of Rhode Island and Providence Plantations, edited by Gertrude Selwyn Kimball, has appeared (Houghton, Mifflin & Co.). In every respect it confirms the favorable judgment we passed upon the first volume. Military affairs claim even a greater attention between 1746 and 1775, the period covered by the present volume, than between 1723 and 1746; nearly 150 of the letters and documents deal wholly or in part with the French wars. On the other hand, a greater variety of subjects are touched upon. After military matters, the questions most prominent are the navigation acts and the organization of the customs; the growing irritation between the colonies and England after 1765; the colonial currency; the development of colonial manufactures, and the organization of the Admiralty courts. Other matters, which are mentioned in one or more letters, are the scheme for requiring all Assemblymen to take an oath of allegiance to the King; postal service in the colonies; electioneering; colonial debt; petitions to Parliament; slave trade; Indians; colonial agency, etc. The volume contains five illustrations of remarkably good quality—three portraits, two houses. A single appendix is devoted to giving a chronological list of the correspondence of the Governors of Rhode Island from 1731 to 1775 printed in the Colonial Records. Between 450 and 500 letters are chronicled here with exact reference to the Records—a service which greatly increases the practical value of the work. The volume closes with a carefully prepared index of twenty-seven pages. Each subject will ordinarily have been entered at least three times, often four or five times, depending on the subject. Mechanical devices increase the usefulness of the index. The work of the editor in preparing the notes for this volume shows the same restraint, exactness, and good judgment exhibited in the first volume. On the whole, these two volumes must be considered as among the most valuable contributions to American colonial history that have appeared for some time.

Three books from the Friedenwald Company, Baltimore, on Hebrew subjects are evidently products of the Semitic Seminar at Johns Hopkins, and give laudable proof of the variety of Old Testament and Jewish studies there. Two appear to be dissertations. One, by Dr. William Rosenau, is on 'Hebraisms in the Authorized Version,' and is a very elaborate, often overstrained, but suggestive treatment of an important source of the English speech. Dr. Rosenau's weakness is, if anywhere, on the English side, which he is apt to take too mechanically. The second, by Dr. Adolf Guttmacher, on 'Optimism and Pessimism in

the Old and New Testaments,' is a more ambitious attack on a deeper problem. The success, too, is certainly greater, and the book forms a really solid piece of work. There is independent thought in it, besides the exhaustive citation of references becoming in a dissertation. The third, also by Dr. Rosenau, consists of a series of lectures on 'Jewish Ceremonial Institutions and Customs,' delivered in 1901 before the Semitic Seminar of Johns Hopkins, and now cast into book form. The result is a most interesting little book, straightforward and terse, and very well illustrated.

The first part, just published, of Dr. Cheyne's 'Critica Biblica' (London: Adam & Charles Black; New York: Macmillan) is a series of textual, exegetical, and historical notes on Isaiah and Jeremiah. Prefixed is a prologue, which is practically a manifesto of "the new criticism." A great period in criticism has closed, and we are in the lull which had to follow. To open another forward movement was the aim of the 'Encyclopædia Biblica'; and to carry it further, of this new series of publications. Later there will appear a comprehensive historical work stating this new criticism in positive form. The present notes are intended to form a basis for that work, and to prepare the student who works through them for the new and very different standpoint and method. Thus, in time, doubtless, we shall learn whether Jerahmeel is the greatest mare's-nest ever discovered by a scholar of the first rank, or the most revolutionary and important step which Old Testament criticism has ever taken.

If there has been any doubt as to the negative position, at least, of Professor Delitzsch in his 'Babel und Bibel,' it must be completely removed by his "Zweiter Vortrag" (New York: Lemcke & Buechner). For him flatly there is no revelation, in spirit or letter, in the literature of the people of Israel, nor special divine working in their historical development. The Old Testament ceases to have any claim to a place in theological study; it is part of the history of religions. In a "Dritter Vortrag," Professor Delitzsch promises us, when the dust has cleared away, his positive views on religion.

The first part of Hann's 'Handbuch der Klimatologie' has been translated by R. De C. Ward, assistant professor of climatology in Harvard University, and is just issued by Macmillan under the title, 'Handbook of Climatology.' The volume is an excellent treatise on general climatology, with a few changes from the arrangement of the original work approved by the author, and with numerous additions of notes and references by the translator to bring it up to date from the time of the second German edition (1897). It makes a great advance on anything in English, and must at once take with us the high rank that the German original holds in Europe. It is in particular a marked improvement, so far as climate is concerned, over the books that have been prepared by physicians, with special relation to the medical aspects of the subject and with too little attention to its physical aspects. Part i. treats of climatic factors, temperature, moisture, wind, etc. Part ii., occupying nearly three-quarters of the book, gives a systematic discussion of the controls of climate, beginning with the action of sunshine, and then tracing out the various modifying influences of land and water, mountain and plain, forest and desert, and discussing in much detail the effects of various kinds of winds. The volume will serve excellently as a text-book or as a book of reference.

The Women's Auxiliary of the Civil Service Reform Association of Maryland has issued, as its first publication, under the comprehensive title 'School Conditions with and without the Competitive System,' two papers given recently before the National Association in Philadelphia by Prof. Lucy M. Salmon of Vassar and Dr. H. O. Reik of Baltimore, respectively. Dr. Reik makes a dramatic presentation of the change that has taken place in the public schools of Baltimore since the time when Mr. Rice characterized them in the *Forum* as among the very poorest in the country—a change brought about through the agency of the new charter, which became completely effective in the spring of 1900, together with the good choice of a School Board that was made by Mayor Hayes. The paper of Professor Salmon deals with the more general aspects of the question. This little pamphlet has already been widely circulated by the organization above named. It is an instance of very useful work that is being undertaken by women (in Boston, New York, and Baltimore) who find themselves unable to endure with patience the political ills from which both sexes suffer alike.

The *Journal of Geography* turned over a new leaf with its second volume, begun in January. It is henceforth to be published by Rand, McNally & Co., Chicago, and edited by Professor Richard E. Dodge of the Teachers' College, Columbia University, and Professor Edward M. Lehnerts of the State Normal School, Winona, Minn. Its chief intention is to promote the study of geography in elementary, secondary, and normal schools, through the teachers. The original articles in the first number are excellently adapted to that end, and skilfully illustrated. The selected matter also shows the expert hand.

In the *American Historical Review* for April (Macmillan) will be found the report of the meeting of the American Historical Association at Philadelphia last December. We have found of special interest in the remaining contents Professor Henry E. Bourne's paper on "American Constitutional Precedents in the French National Assembly." The American example was regarded, weighed, and discussed more or less intelligently; but there was nothing analogous in the French past to build upon, and the American bill of rights proved more attractive than any single provision in the American system.

A correspondent writes: "It is not so new as many people suppose—the treatment of consumption by means of fresh air and milk. The following passage is from the 'Letter to a Friend' of Sir Thomas Browne, which was first published in 1690. 'Some think there were few consumptions in the old world, when men lived much upon milk; and that the ancient inhabitants of this island were less troubled with coughs when they went naked and slept in caves and woods, than men now in chambers and feather beds.' "

The Roman papers announce that an Englishman, Mr. Lionel Phillips, has made the Italian Government another gift of one hundred thousand lire for the purchase of the remaining private houses that stand over the site of the Basilica Aemilia. It will thus be possible to complete the excavation of that structure, about half of which was uncovered in 1899 and 1900. Excavations are at present in progress in the House of the Vestals, where the earlier, underlying structures of imperial times are being investigated, from the Arch of Titus to the Porta Mucionis on the Palatine, and between the Temple of Augustus and the Church of S. Teodoro, where foundations in *opus quadratum* and concrete are being brought to light, which Huelsen thinks may belong to the Horrea Germaniciana.

—None better than Mr. Apthorp could have been chosen by the Oliver Ditson Company as editor of the collection of 'Fifty Songs by Robert Franz' which constitutes the latest volume in their "Musicians' Library." Not only is he an enthusiast, but he enjoyed the personal friendship of the man who had only one equal, Schubert, as a song writer; of whom Emanuel Garcia, the most eminent teacher of the Italian method in the last century, said that of all German songs his were the best suited to the voice; who was one of Liszt's idols, and who aroused the enthusiasm of even Wagner, who cared so little otherwise for the compositions of his contemporaries. Once before, in 1879, the Ditsons brought out a collection of Franz songs, in two volumes, which had his own sanction; but it was badly printed. The present edition is an improvement in every way, except in the omission of the footnotes briefly characterizing each of the songs; but, for this omission, Mr. Apthorp's luminous preface makes ample amends. It gives a brief sketch of Franz's life, and describes the peculiarities of his genius, as well as his relations to Wagner and other composers. A glimpse into his workshop is given in the form of a facsimile of an inedited song. Of the fifty songs selected by Mr. Apthorp, about forty are undoubtedly the gems of all the collections. Concerning the others, opinions may differ. It may have been wise to omit the quaint "Es ragt der alte Elborus" as being caviare to the general; but the editor will certainly have an extra week in purgatory for leaving out "Childe Harold," "Dic schlanke Wasserlilie," "Ich hab' in deinem Auge," and, above all, the heavenly "Wonne der Wehmuth," which was evidently one of the favorites of Otto Dresel, Franz's most intimate friend, since the opening of one of his own best songs, "Lieb Liebchen," is an echo of it. However, it was impossible to squeeze all of the best Franz songs into one volume. The gems in this one are worth a thousand times their cost.

—When Matthew Arnold, in his lectures "On Translating Homer," objected to blank verse as the medium, because it lacked the rapidity of movement which is one of Homer's most obvious qualities, he was thinking of that slow and dignified rhythm which we have come to associate with the idea of blank verse, because such is its movement in the hands of masters like Milton and Tennyson. He admitted that a style of blank verse was conceivable which should move rapidly enough for the purpose; and he thought that it would be interesting to see such a style applied to Homer. If we had any reason to believe that Mr. T. H.

Delabère May of Trinity College, Cambridge, the latest translator of Virgil's Æneid (London: Nutt), had ever read Arnold's lectures, we might fancy that he thought it would be interesting to see that style applied to the very last poet upon whom such an experiment should have been tried. The result is something which, rhythmically considered, is as much unsuited to most of Virgil as it might perhaps be suited to much of Homer. Bristling with monosyllables (there are more than a hundred in his first twelve lines to only eleven in the corresponding ten lines of Virgil), Mr. May's verse jerks the reader along through nine syllables only to bring him up sharp with a constantly recurring monosyllabic close. He has a fond affection, too, for the letter *s:* not only do some verses positively hiss their swift way along, but on the third page we observe no less than five phrases in which a word ends and the next word begins with the sibilant. It is a pity that Mr. May did not realize the part which rhythm should play in the faithful rendering of a poet like Virgil for he certainly has, so far as the rendering of the mere words is concerned, shown that he understands their meaning, and he has brought this out with a clearness worthy the emulation of the great Mr. Bohn himself. Perhaps this was his main object; for in his preface he remarks that he has "thought that a blank verse rendering of the Æneid might be written which should be as helpful to the student as an ordinary prose crib, *and more easily remembered*" (we have ventured, also in the interests of students, to italicize these words). But when he proceeds to suggest that his translation is faithful in spirit to the original, he entirely overlooks another of Arnold's dicta, that it is not fidelity to an original to give its matter unless you at the same time give its manner. Nothing could be further from the manner of Virgil than what Mr. May has presumed to call his "literal rendering" of the Æneid. Nobody who has not read the Latin could ever get an idea of the greatness of the original from Mr. May's book; and nobody who is able to read the Latin need trouble himself to look into it.

—The Germans undoubtedly excel in such handbooks as the "Künstler Monographien" or the "Monographien des Kunstgewerbes" (Leipzig: Seeman), of which No. 9, Cornelius von Fabriczy's 'Medaillen der Italienischen Renaissance,' lies before us. The large size of the page permits of a sufficient number of illustrations, in the present instance 181, to represent the whole matter graphically. There is this inevitable drawback to the study of Renaissance medals, that, after the founder of the art, all else is decadence. No one of his successors attained the absolute simplicity of plane and line that make Pisanello's portraits equal if not superior to the best Greek coins, nor again the grand manner of the allegorical designs which adorn the obverse of his pieces. This said, the beginner will find Herr Fabriczy's treatise an agreeable guide for the one hundred and fifty years from Pisanello's first medals to the death of Pastorino in 1592, while the numismatist will note that, with scrupulous acknowledgment of earlier investigations, he pursues throughout an independent course. After preliminary discussion of the method of producing medals, cast and stamped, he treats successively Pisanello and his school, the other medal makers of northern Italy, those of Florence, and of Rome. A second and much shorter section treats of sixteenth-century medals struck from a die, under the captions, The Medici, The Popes, and The Paduan and Milanese Designers. Throughout, the treatment is sober, and the reproductions generally speak eloquently for the score or so of new attributions hazarded by the author, who, for example, adds a medal or so to the lists of L'Antico, Cavalli, and Alessandro Vittoria, the virile portraitist of the pamphleteer Aretino; and distinguishes between the rather feeble medals of Francia and those of a pupil.

—More important are Fabriczy's comments on the Florentine medallists, who, with a technique inferior to that of the north, had a great advantage in their subjects—the Medici Academy notably—and a gravity all their own. To run over the list of Nicolò Fiorentino, for instance, is to renew acquaintance with Lorenzo, Giuliano, Poliziano, Pico della Mirandola, with Lorenzo Tornabuoni and his wife, Giovanna degli Albizzi, to celebrate whose nuptials Botticelli painted the frescoes of the Villa Lemmi now in exile in the Louvre. Fabriczy actually adds a new medallist, Adriano Fiorentino, to the Tuscan roll. This artist, a scholar of Bertoldo, is known only from a medal of Elizabeth, Duchess of Urbino, and by a portrait of Degenhart Pfeffinger, Marshal of Lower Bavaria, with his arms in a wholly German feeling on the obverse. Very interesting, too, is the assertion that the unique Ercole II. of Este in the Weimar cabinet is a trial proof of Benvenuto Cellini's. But the expert reader will gather from these instances that the connoisseur as well as the amateur must consult Herr Fabriczy's monograph. At only one point would we take sharp issue with his opinion. The superb plaquette of Leon Battista Alberti in the Louvre is too unlike the work of Pisanello to be safely attributed to the greatest of the medallists. It shows a solicitude for detail—note only the hair, the ear, and the drapery—which is wholly alien to Pisanello's inflexibly austere style. To the present writer it seems distinctly Florentine. The hypothesis that it is Alberti's own, allures, but it is better to leave it anonymous, thanking Heaven for a time that provides anonymous works of this quality.

—The actual situation in China, as concerns education and reform, is shown in the fifteenth annual report of the "Diffusion Society," of which Sir Robert Hart is President, and funds for which are supplied mostly in China by merchants and some liberal-minded Chinese. The modern Government colleges now number thirteen, eleven being provincial and two prefectural; a half million of taels being set aside for modern education in a region containing three-fourths of the population of China. Over these, so far, three Americans preside. About 700 Chinese young men and a score or so of young women are studying in Japan, while probably as many as 200 Japanese are in the employ of the Chinese Government as teachers, engineers, advisers, etc. Four pages of specimen questions, now used at the triennial examinations, which 150,000 students attend, on modern and Western subjects are given, *e. g.*, "What are the Western sources of economical prosperity, and, as China is so poor, what would be the best for China?" The appendix shows that the Reform movement of 1898 owed its initiation and development largely to the literature published by this Society for the Diffusion of Christian and General Knowledge among the Chinese, which proceeds upon the belief that the distinction so commonly drawn between the "secular" and the "sacred" is a vicious one. Its object is to supply high-class literature to intelligent Chinese. Of the long list of publications issued or in preparation, the majority are standard works on biography, geography, history, literature, nature study, handy cyclopædias, etc. Among the new books in press are Paul Bert's 'First Year of Science,' 'Comparative Anatomy,' Pouchet's 'Universe,' 'Story of Eclipses,' 'Fifty Years of Science,' 'Life of Queen Victoria,' 'Relative Strength of Nations,' 'Principles of Western Civilization,' etc. Dr. Y. J. Allen, editor of the *Review of the Times* (48,500 copies and 2,910,000 pages in 1902), is issuing in twenty-one parts, fully illustrated, a comparative 'Study of Civilization,' in all ages and lands, as self-determined by the treatment of women, 'History of the Czars of Russia,' and Lawrence's 'International Law.' In 1902 there was an unprecedented demand for the Society's publications, which are furnished at half-price to those who start circulating libraries. In place of the Boxer suggestions of extermination, or conservative remedies fitted for ancient times or conditions, or racial opposition and brutal materialism, this society offers as the solvent of China's difficulties education and enlightenment. Such need is seen in the fact that until very lately no Mantchu prince was allowed to spend a night outside Peking. Dr. Timothy Richard of Shanghai, the Secretary, has recently by Imperial invitation spent four months in Shansi, organizing the Government college there. This institution has, besides seven foreign and six Chinese professors, the largest staff of translators of any Government college in China, who are busy at Shanghai in preparing text-books on Western principles, an example now being followed in Chi-li by the viceroy, Yuen, the successor of Li Hung Chang.

DIABOLUS EX MACHINA.

Democracy and the Organization of Political Parties. By M. Ostrogorski. Translated from the French by Frederick Clarke, M. A., formerly Taylorian Scholar in the University of Oxford. With a Preface by the Right Hon. James Bryce, M. P. In two volumes, 8vo, pp. lvii, 627, xliii, 758. The Macmillan Co. 1902.

This is a very notable contribution to our knowledge of the contemporary politics of English-speaking peoples. It entitles its author to the rank of master craftsman in that guild of political thinkers which boasts Bagehot, Bryce, and Tocqueville among its brethren. It is essentially a painstaking and minute study of machine politics in all its phases. Upon this extra-constitutional aspect of modern democracy Ostrogorski has concentrated his penetrating scrutiny. He is interested in the *vis viva* of politics, not in the stereotyped apparatus erected by public law for the safe

conduction of fluid political energy. Back of the dummy styled by courtesy the legislator, he sees the wirepuller and the boss; and, "unduped of fancy" and unblinded by the great political superstitions of our age, he is stubbornly intent upon discovering the vital heart of things political. In this dissection of the body politic he plies a patient but relentless scalpel; and if the morbid anatomy of politics hides at times any secret from him, it is seemingly this—that civic tissue is not universally gangrenous. Despite the fact that, in his presentation of his theme, the miniaturist's fidelity to details is everywhere in evidence, he does not allow his reader to lose the forest in the trees. He loves occasionally to leave the political laboratory for an adventurous flight in the "cold, thin atmosphere" of dialectics, and the sweep of his final generalizations betrays an affinity for the 'Politics' of Aristotle.

Mr. Ostrogorski comes well equipped to his task. The position which he held in the Russian bureaucracy required of him a wide acquaintance with the science of comparative legislation. One may also fairly surmise that his personal experience of an autocratic régime—of its excellences no less than its defects—induced in him an intellectual detachment vastly serviceable in the scientific study of a diametrically different political system. To the survey of a new land he brought a fresh eye, not jaded by the glare of so-called popular government. He brought also to his task judicial impartiality and candor, and the rare patience of fifteen years of study and reflection. Most unique of all his qualifications is that he combines a profound knowledge of political philosophy with a personal knowledge of living politicians. He not only has studied in the library, but has kept his eyes open in the ward meeting. He knows Plato's 'Republic,' and he knows the Platt machine, and he knows them both thoroughly.

The first of the two volumes is devoted to party organization in England, its rise, its spread, and its results. The political machine in England is fairly recent, dating from 1867, and is a Brummagem ware. Prior to the Reform Bill of 1832, organized and permanent political parties were to be found only within Parliament. Particular issues, it is true, like Catholic Emancipation, had, previous to this time, recruited their adherents throughout the kingdom, and had induced concerted action in the way of political agitation. But such movements were sporadic. With the attainment of their object or the cooling of their fervor, they collapsed. It is also true that, long before 1867, on the eve of a Parliamentary election, the Whigs and Tories hastily devised throughout the provinces local agencies to attend to the business of registration and to bring out the party vote. The Eatanswill election in the 'Pickwick Papers' is not improbably a veracious picture of this early form of party activity. But when a new Parliament had once been chosen, virtue went out of the local political agency, and it lay dormant until another Parliament was to be elected.

The beginnings of the permanent political machine in England verify what we may take to-day as a political axiom—that the more legislative safeguards against political injustice abound, the more will partisan deviltry superabound. The act of 1867 had been devised to secure minority representation in certain constituencies like Birmingham, which returned three members to Parliament. The Birmingham Radicals, casting about to circumvent the law so as to secure a solid Liberal delegation, hit upon the machinery of the caucus or primary meeting. A convention of delegates elected in the wards made regular Liberal nominations. The Central Liberal Committee in the town, by means of a careful canvass of their voting strength in each ward, effected such a nicely calculated delivery of their adherents' ballots as to elect a solid Liberal delegation. The machine had worked. But, like many another invention, its profits were destined to enrich, not the inventor—an architect by the name of Harris—but the man who first gauged its possibilities. It is hardly necessary to say that this was none other than Joseph Chamberlain. Along with Aaron Burr, he shares the fame of having first fastened upon his country the régime of machine politics.

But men do not light a candle and put it under a bushel. Neither do they devise a successful machine and confine it to Birmingham. The Liberals in other places were induced to build similar machines. Then a national federation of the Liberal associations was effected, and its permanent headquarters were established, first at Birmingham, and finally at London. By 1886 the Tories had devised their chain of machines under the style of the Primrose League. Essentially this was and is a political machine, although its founders were shrewd enough—or simple enough, for it is not quite clear which—to give it a veneer of sham mediævalism.

Ostrogorski contends that the true government in England to-day is essentially an oligarchy, anonymous and irresponsible, consisting of the leaders of the machine which happens to have a majority in Parliament. The leaders of the machine have been able to usurp power by their hypocritical obeisance to the dogma of democracy. They hide their usurpation by the pretence that they are but registering the voice of the caucus, as that in turn echoes the *vox populi*. The fact is, "that the ward meetings are deserted, as the agents of the caucus themselves admit frankly enough" (I., 332); and "it is in these, which contain 2 to 3 per cent. of the whole electorate, that the delegates are chosen who are to invest the caucus with its representative authority" (I., 333). In practice, therefore, a few active politicians manipulate the meagrely attended ward meetings, and secure therefrom an ostensibly popular ratification of nominations which the leading politicians have themselves previously concocted. This hierarchy of wirepullers thereupon dons what it gives out to be the livery of public opinion, and in this disguise serves the devil—that is, themselves.

Sadly amusing is the description of the manner in which the organization proceeds to wake up the electorate to vote for the candidate who is supposedly invested, by virtue of his regular nomination, with the democratic pallium of "popularity." The proportion of voters that would go to the polls spontaneously is variously estimated at from 35 to 50 per cent. To the lost sheep of the house of Indifference the canvasser is sent with blare of trumpet and clang of tom-tom. The political platform also is perverted from serving as a school of reason to the base function of educing a flow of feeling sufficient to bring out the party's voting strength at the polls.

With its creatures once ensconced in office, the caucus, for so Ostrogorski designates the permanent organization, practically nullifies true democratic government. It exercises an obtrusive intervention between the Parliamentary leader of the majority of the House of Commons and the members of his party, between the member and his constituency, and between Parliament and outside opinion. The Premier is responsible primarily to the caucus. Let him conform to its behests, and the "Parliamentary party leader is converted into a party dictator" (I., 215). Let the individual member kick over the traces of the caucus, and the local organization in his constituency is straightway charged by the central caucus to regard him "as an heathen man and a publican." Let the mutterings of public interest become audible with reference to a new issue, an issue unwelcome to the caucus, as jeopardizing party solidarity, and the caucus straightway struggles to garrote its professed master, Public Opinion.

This sweeping indictment of the political machine in England Mr. Bryce, in his preface, seeks to evade by confession of all the concrete facts alleged, and yet by avoidance of the verdict pronounced. He urges that the author has taken certain phenomena as unduly typical, and has underestimated certain factors which greatly relieve the sombreness of the picture. It would savor of the ridiculous in one not intimately acquainted with English politics at first hand to attempt to decide when such learned doctors disagree. But, by comparison with machine politics in America, it would seem that England might find cause for a large degree of residual satisfaction when the arch-critic of her politicians admits that "the motive powers which set them going" are "the feeling of duty and that of self-love" (I., 353), and that "when all is said and done, the members of the English caucus who reap material benefit from it in one form or another are only a minority" (I., 358).

The second volume is devoted principally to a study of the machine in the United States. It combines the history of the machine's evolution and the philosophical rationale of its inevitableness under the contemporary social conditions. Both of these fields had been previously explored. The first was the common property of a score of investigators, while Bryce in his 'American Commonwealth,' and more particularly Henry Jones Ford in his 'Rise and Growth of American Politics,' had staked out the main landmarks in the latter province. Still, Ostrogorski's delineation of both subjects has an independent value of its own. It affords a far greater wealth of detail. It assesses pertinent social and economic considerations more accurately. It throws a flood of light over certain collateral topics, such as the comparative influence of women upon politics in England and America. The portraiture of the machine's Rake's Progress is drawn with an unerring pencil from the point where "the managers of the Organization, disguised as members of Congress, forced the Executive to make over the whole Federal patronage to them" (II., 133), to the culminating in-

famy where the Boss arises as a political dictator and a broker in legislation and administration.

On the other hand, Ostrogorski evaluates most discriminatingly the intrinsic efficiency of the machine as a government—a government without honesty of purpose or legitimacy of origin, to be sure, but one whose leaders "are recruited by natural selection," whose adherents are bound together "by mutual attachment and feudal loyalty to the chief," and in which "individual responsibility and personal merit are the only principles that govern their relations" (II., 439).

In the hundred pages entitled "The Struggles for Emancipation" which portray the various reform movements in the United States, he appraises very sagaciously both the gains and the losses attributable to civil-service reform, the Australian ballot, and other projects which externally look towards political betterment. It is a matter for regret that he did not think it worth while to devote a chapter to a formal comparison of party organizations in England and in the United States. The reason for this omission was probably his conviction that the machine in this country is what the caucus in England is bound eventually to become. But this is far from certain; nay, it does not seem even probable. This is the strong point that Bryce in the preface makes against Ostrogorski, that the democracies of the self-governing British colonies, and particularly in Australia, have not developed upon the lines of the American machine.

The materials for such a comparison of the English and American party organizations this work affords in abundance. The two organizations are alike usurpers, veiling their usurpation by their ostensible deference to popular sovereignty, and maintaining their power through the apathy of the electorate. They are alike incapable of representing living public opinion. Even with its ear to the ground, the machine is often so blinded by its fear of disintegration that it frequently persists in a policy under which it is buried in a political landslide. But, despite these likenesses, between the two organizations there is a great gulf fixed, and that gulf is money. Not that the use of money as a corruption fund is unknown in England, for the author shows how the Corrupt Practices Act of 1883 is largely nullified through the agency of the caucus; but the English politician is working generally for the power and dignity that attach to a seat in Parliament, whereas the typical member of the American machine, though doubtless moved by a number of motives, is chiefly "working for his own pocket all the time." This sharp distinction between the party organizations of the two countries holds true for local as well as for national politics. In spite of the fact that national party lines are drawn to an increasing extent in British municipal elections, Ostrogorski, who is nothing if not Draconian in the judgments he passes, allows (I., 488) that "municipal interests are not sacrificed to those of the political parties or of the politicians." This by itself differentiates the two systems *toto cœlo*.

There are occasional minor slips in the second volume. A carelessly framed statement (II., 181) seems to imply that almost all railroads in the United States were built by Federal subsidies. The statement relative to municipal public debts ignores the relative slackening in their growth since 1880, and it is certainly incorrect to say that the colossal sums expended left "the cities with no thoroughly developed or well executed public works" (II., 177). The statement as to the place of United States history in our schools is largely erroneous; in particular the allegation that in the common schools it is "brought to a close with Washington's Presidency" (II., 324). Aaron Burr is spoken of as "poorly connected" (II., 42); and a name is occasionally misspelled. But in the main the picture is accurate. And, dark as it unquestionably is, its sombreness is relieved both by its ungrudging admission of the "sovereign protection" accorded by our courts to the fundamental rights of the man and the citizen, and by its generous recognition of awakening public spirit.

The closing part of the work (II., pp. 607-741) is an attempt to construct a theoretical system of government capable of realizing the goal of democracy. This is an elaborate, often a profound, but after all a futile, exercise of political ingenuity. Ostrogorski does not make the mistake, so common among fledgling reformers, of thinking that we may be saved by machinery. No one insists more emphatically than he that political salvation rests fundamentally on individual and national integrity, and that without unselfish public spirit the best calculated schemes of reform are bound to shipwreck. But he is persuaded that the knell of party has rung, and he is concerned to point out the substitute that must be introduced if true democracy is not to perish from the earth. This substitute he finds in political leagues seeking each of them to realize only a single object, and naturally dissolving when that object is attained or its quest is abandoned. This scheme of "temporary single-issue organizations" would, he thinks, involve as its corollary under régimes of the English type the abolition of the collective responsibility of the Cabinet, for which the responsibility of the individual minister would be substituted. It makes the reader sit up and rub his eyes when he is told that the exploitation of power by political parties in the United States is to be abolished by making over the election of the President to Congress; but we are reassured when we learn that the Congress which is to exercise this function is one "no longer organized on the basis of party majorities." Of such an ideal scheme we can only say, "It is high, we cannot attain unto it." For, if the political experimentation of free countries has proved anything, it seems to be this, that those political devices which prove of most benefit in the long run are those which minimize the strain upon the political activity of the body politic. Such, for example, are our judiciary system, particularly our Federal judiciary, and in England the infrequency of elections and the small number of elective offices. Ostrogorski's scheme would vastly increase the political strain upon the individual citizen, and is calculated to work successfully only

"Hereafter, in a better world than this."

RECENT NOVELS.

The Lieutenant-Governor. By Guy Wetmore Carryl. Houghton, Mifflin & Co.

The Spoilsmen. By Elliott Flower. L. C. Page & Co.

The Wind in the Rose-Bush. By Mary E. Wilkins. Doubleday, Page & Co.

Handicapped among the Free. By Emma Rayner. Dodd, Mead & Co.

The Substitute. By Will N. Harben. Harper & Brothers.

Walda. By Mary Holland Kinkaid. Harper & Brothers.

A Lad of the O'Friels. By Seumas MacManus. McClure, Phillips & Co.

Mr. Carryl, on his title-page, calls his book a novel, and we are bound to believe him. Otherwise we might have thought that he was preparing speeches for the School Reader of the future, always supposing that in the future there will be schools and Readers. For the hero declaims upon his love for his State, the heroine declaims upon optimism, upon the creed of an American and upon the redemption of rejected lovers, while between clauses she is calling the accepted one "boy dear" and "Johnny boy." The characters all declaim, indeed, so that particularization is not needed. Their orations run in part upon patriotism, State-allegiance, temperance, political corruption, and strikes. There is not a wrong sentiment in the book except where Natalie momentarily defends the act of shooting a corrupt office-holder, and even this mistake is made productive of good, since it helps the Lieutenant-Governor to see clearly the opposite side of the question; which only goes to show that incessant oratory cannot fail to be useful. If it does not instruct, it warns. Whether it adds to the reality of a story is another matter. The truth is, that while the book may justly claim as its own some mildly amusing characters, some rather clever sayings, and not a few strong pleas for love of country and State, as a whole it is formless and raw.

'The Spoilsmen' is a good example of a style of story which is fast multiplying, and threatens to swamp American libraries. The motto of the type is "Art for the Inartistic's Sake"; and it seems indispensable that the nature portrayed should be the nature of something sordid, unlovely, mortifying, clattering with modern machinery, phrased in ultra-modern slang. When, as in Mr. Flower's book, the object drawn from its dread abode into the cheerful day is the ward politics of a large city—Chicago in this case—there is no fault to be found with the moral trend of the display. There is even edification for voters, for would-be office-holders and others in the exposition of Bossism and corruption which Mr. Flower makes in glaring colors and with Röntgen-ray detail; and that he makes it through the experiences of two honest men trying faithfully and in vain to serve their respective wards, an aristocratic and a plebeian, only brings home the more forcibly the lesson of political difficulty and despair. It would not be reasonable to expect ward politicians to express themselves in the language of Ruskin, or to ask authors to eliminate automobiles from their stories of modern cities; but it may be permitted the fiction-loving reader to regret that his novels nowadays too often progress from song to sermon, from sermon to saloon primaries. They ought to be rechristened and called wholesome lessons disguised as bitters. As pamphlets in

a "Good Citizenship Series," they would be no less readable, perhaps no less read, than in dramatic form, necessitating prosaic properties and a language which makes one cry, "How long?" Hear what the fight-for-the-right pugilist says, for instance:

"He can put up a nasty straight-out fight, but he's shy of speed in his head-piece. You're all right with your quick-action think-tank, but you're out of it now."

Thus far as to the æsthetic pleasure to be gained from this book and its fellows. It is cheerfully added that Mr. Flower has done his task well. He has inquired within at the doors of esoteric ward work to great purpose, and holds up to the gaze of thoughtful citizens a picture of bribery and cunning that is full of caution to sinners and victims.

It ought not to be surprising that Miss Wilkins, the apostle of naturalism, should make an excursion into supernaturalism, and assuredly it ought not to be surprising that she should look for her new material close to where she found the old. To gaunt, hollow-eyed New England housewives and mind-starved spinsters, ghosts should easily appear, born of isolation and monotony. But here comes the strange thing: it is not out of her half-crazed, lonely folk that she has made her spirit-seers. She has gone into the comparatively worldly stratum of New England country society, to the women who wear ruffled black-silk dresses, to those who board the school-ma'am, to those who are left in comfortable circumstances and move into town. It is not favorable soil for ghost-seers, and the ghosts show it, they are so gratuitously ghostly; they go out of their way to be ghosts. Obeying no law of shadowland, they work jugglers' tricks rather than supernaturalism. They plague rather than haunt. They annoy the nerves rather than curdle the blood. What they do, seems the result of their author's ingenuity rather than of their own need to be recognized. True, a ghost need not wear samite. Cordial welcome awaits the gingham ghosts of Yankee-land. But they must be really ghosts, not sleight-of-hand performers. Of all the present group, the one that gives the reader the nearest approach to a chill is the little child-spirit of the concluding story. Mr. Newell's illustrations are in keeping. His phantoms are dyspeptic, more than mysterious; his phantom-gazers express no more than a reasonable, black-alpaca consternation.

'Handicapped among the Free' is a story of the "Black Belt" of Alabama, and a moving document in the great case. Passionately on the side of the negro, the writer makes her plea the more potent by permitting herself to delineate here and there a just white and an unjust black. While with a hot pen she describes the horrors pursuing the black race in the South, she can yet put a cool finger on the pivot of part of the agitation in saying:

"No race can ever rise so long as the best men and women in its own ranks look upon it with scorn." "When uplifting is, to the better among any people, synonymous with shaking off from their feet the dust of their own race, and preferring admission amongst men of another nationality to that leadership in their own to which their higher position should point, then there is little hope for the race to which they belong." "Unconsciously, Free [the negro hero] had fallen into the selfishness—very natural, perhaps, but very much to be deplored—of most of the rising men of his own race. He had thought of achievement as making his way among white men. He had taken his public to be a white public, and all around him were black men looking up to him, and he did not see them—except as so many darkies. He chafed at the scorn of the white man, and he passed on that scorn to the lower ranks of his own people, and did not even know he was doing it."

The problem is well stated by the old negress, who says: "De nigger he got to race wid de white man, and de white man . . . hab de long legs and de go-aheadness all inside him. De nigger hab de behindness and de hab-nothingness." And old Betsey touches the kernel of the matter when she says of her husband's persecution and business ruin, because he had aspired to the magistracy, "And now West's laid low and most everything's swept away, the white feelin' 'll maybe stop workin'."

The workin' of the white feelin' leads to the tragedies which, though heaped high, are commented on in a temper of wonderful moderation. As a story, the book is too long, and too much given to preachments, black and white. But if its style is wordy, its incidents are like hammers. It rises superior to small criticisms, an appalling human brief, yet not without a hope—that hope, the negro schools of the South and their effect upon the negro's attitude toward his own people.

Mr. Harben is a master at reproducing the atmosphere of Georgia, and he has a fund of good Georgia stories. His main story is good, too, but would have been better had it stood more by itself. His hero is a young man who has been substituted as expiatory heir to the affections of an older man who, years before, had killed his own friend in a drunken passion. The substitute has in divers ways a checkered career, the history of which would be of more dignified interest than it is if it were not interwoven with an overplus of mere local anecdote. The book is a not perfectly happy fusion of a good story and a sheaf of comic-paper clippings. For the story part of the combination, it may be said that it shows Mr. Harben's unquestioned skill at portraits of all Southern sorts—the mountaineer, the storekeeper, the patrician, the sons and daughters of the soil.

'Walda' is a story of America, too, but of an engrafted and not native America. It concerns itself with a religious community of German settlers in the West, where property is held in common and love and marriage are discouraged. Walda is the maiden who, from her noble character and spiritual tendencies, is about to undergo consecration as prophetess of the community when the story opens. The chance visit of an outsider changes the current of affairs in Zanah, and many community affairs run rough when confronted by the facts of human feeling. The "almost photographic fidelity" claimed for this picture of an actually existing community gives the book an interest which might flag were it approached as a mere story.

'A Lad of the O'Friels' recalls the little Provençal boy whom Félix Gras has celebrated in his matchless story, 'The Reds of the Midi.' Like him, Dinny O'Friel spent his time curled up in the corner of the shoemaker's shop which was the neighborhood club in Knockagar, hearing and learning many things. From the boy's standpoint, we have a chronicle of an Irish village. His neighbors are admirably drawn types of deviltry or sensibility; he himself is happily compounded of both, equally at home in the shoemaker's corner, rambling over the hills, lighting the fires on Bonfire night, buying ribbons at the harvest fair, or going on a pious pilgrimage to the Holy Island. Notwithstanding a few broken heads and a certain amount of billingsgate, the prevailing air is one of Irish kindliness and neighborliness lending cheer and charm to the story. The realness of the Irish dialect falls persuasively on the ear grown used to colonial adaptations. The humor is thoroughly Irish, but not all local; the good-bye note of the "Vagabone" departing for America is a thing of worth to all literature. Indeed, we think that those who are indifferent or hostile to Irish stories in general, considering them oppressive by reason of plots and potheen, may yet find in this humor-shot idyl an hour of relenting, if not of refreshment.

DOCUMENTARY HISTORY OF THE PHILIPPINES.

The Philippine Islands, 1493-1803: Explorations by early navigators, descriptions of the islands and their peoples, their history, and records of Catholic missions, as related in contemporaneous books and manuscripts, etc. Translated from the originals. Edited and annotated by Emma Helen Blair and James Alexander Robertson, with historical introduction and additional notes by Edward Gaylord Bourne. With maps, portraits, etc. Volume I., 1493-1529. Volume II., 1521-1569. Cleveland, O.: The Arthur H. Clark Company.

This is in almost all ways the most extensive and most important project ever undertaken in the line of Philippine history in any language, above all the English. To quote from the scholarly introduction of Professor Bourne:

"The American people are confronted with two race problems, one within their own confines and long familiar, but still baffling solution; the other new, remote, unknown, and even more imperatively demanding intelligent and unremitting effort for its mastery. . . . To govern them [the Filipinos] or to train them to govern themselves are tasks almost equally perplexing, nor is the problem made easier or clearer by the clash of the contradictory estimates of their culture and capacity which form the ammunition for party warfare. . . . In the Philippine question, however, although the sources are no less abundant and instructive [than in the case of the negro problem], they are and have been highly inaccessible, owing, on the one hand, to the absolute rarity of the publications containing them, and, on the other, to their being in a language hitherto comparatively little studied in the United States. To collect these sources, scattered and inaccessible as they are, to reproduce them and interpret them in the English language, and to make it possible for university and public libraries and the leaders in thought and policy to have at hand the complete and authentic records of the culture and life of the millions in the Far East whom we must understand in order to do them justice, is an enterprise large in its possibilities for the public good."

In the prospectus for the contemplated fifty-five volumes of the series, we note a preponderance of ecclesiastical decrees, friar chronicles, etc. Not knowing how fully the editors have yet developed their material for the later volumes, it is perhaps unfair to remark that nearly six

pages of documents are listed for the period 1493-1650, roughly the discovery period and "missionary age," and but two pages to the more strictly administrative period, 1650-1803. Of the many documents covering 1570-1610, the really more significant are five, De Loarca's "Relation," De Plasencia's 'Tagalog Customs,' the 1599 'Ordinances of Good Government,' the Jesuit Chirino's Relation, and the work of De Morga, the justice. One might suggest omitting, if necessary, some of the documents for 1570-1650, especially regarding commerce, in favor of data coming closer to the life of the Filipino people in that period, such as the local revolts of the early years, the five-day earthquakes of 1644, and the miracle tales surrounding them. As against the attention paid to commercial regulations and the unsuccessful missions to the Palaos Islands in the early eighteenth century, there is little relating to plans for education, then assuming new shape, and no mention of Governor-General Bustamante, charged with plans for secular education and slain in the Palace in a revolt organized and led there by Jesuits and friars. The royal decree of 1751, ordering a restoration of the old boundaries of the friar estates in central Luzon, "extended by fraud" (to quote it), is not mentioned; it followed the pacification of the Tagalogs after risings (in 1743-4) which were in every way the prototypes of the revolts of 1872 and 1896. We will say no more to show that there must be, in some particulars, a broadening of scope if this work is to give us "the complete and authentic records of the culture and life of the millions in the Far East whom we must understand in order to do them justice."

The series, it is noted, will end with 1803, a date chosen because Zúñiga's story of his travels appropriately closes the eighteenth century. It was aimed to include only documents not otherwise easily accessible; perhaps, also, there was a little shrinking from entering into the controversies of the nineteenth century in the islands.

Professor Bourne's introduction occupies seventy pages; within those limits he has given us the best considered essay on Philippine history ever published in English. One is especially impressed with his plea for fairness toward the record of Spanish colonialism. We might urge that the climatic conditions in Spanish colonies precluded that ruthless extinction of the native stock which followed Anglo-Saxon colonization in the temperate zones; but results speak for themselves, and the fact is that Catholic Spain, missionary and fanatic, has left a more benevolent colonizing record than Protestant England. His extensive reading in Philippine history has led Professor Bourne to side with the traditional view of the islanders at the time of the conquest, as a set of savages, whose descendants owe almost everything to their monastic preceptors. In this he has been unduly influenced by such writers as Retana, a consummate friar-eulogist (some charge, a hireling); and he apparently gives face value to the description of the islanders by Pigafetta, an Italian adventurer who accompanied Magellan. Some will challenge the statement that the Spanish conquerors "preserved the essential features" of the Filipinos' social organization, and that they "introduced" village life. With his estimate of the accomplishments of the Orders in the heroic period of missionary labors, the "Golden Age," as he calls it, it is hardly possible to disagree. He charges the decline from thenceforward on the retrogressive economic policy of the Spanish Government, on its system of trade monopolies, its inept Governors, and corrupt provincial administrators. It is following the pro-friar authorities a little too closely to say that "a corrupt civil service and a futile and decrepit commercial system were, through the friars' efforts, rendered relatively harmless, because circumscribed in their effects." The Orders really ruled at Madrid and Manila, developed the general policies, and jealously guarded prerogatives over details; it is only fair to hold them responsible for the general results, to say nothing of the cases where they deliberately balked civilian measures of progress.

Volume I. contains, besides the historical introduction, 140 pages of documents (papal bulls, treaties, etc.) relating to the "Line of Demarcation" between Spain and Portugal, Pope Alexander's famous "division of the world" in 1493. About 100 pages are devoted to documents concerning Magellan's memorable voyage, closing with the interesting letter of Maximilianus Transylvanius, 'De Moluccis Insulis,' 1522, reciting the details brought regarding Magellan's death and the "spice islands" by the handful of sailors who returned in the only one of the five vessels which circumnavigated the globe. Bibliographic data are appended, and chronological tables of the Popes and the rulers of Spain, 1493-1803. Volume I. is illustrated by a portrait of Magellan, a photographic facsimile of a manuscript bearing his signature, and a facsimile of the title-page of 'De Moluccis Insulis.' There is also appended an excellent map of the Philippine Archipelago. Volume II. is made up of contemporaneous documents concerning the expeditions of García de Loaisa (1525-6), of Ruy Lopez de Villalobos (1541-3), and Miguel Lopez de Legazpi (1564-68), and the voyage of Alvaro de Saavedra (1527-8). Authentic portraits of Legazpi and of Fray Andrés de Urdaneta, with more autographic facsimiles and a picture of the Santo Niño of Cebú, constitute the illustrations.

The work is printed on deckle-edged paper, uncut, gilt top, and is neatly bound.

Life and Correspondence of Henry Ingersoll Bowditch. By his Son, Vincent Y. Bowditch. In two volumes. Houghton, Mifflin & Co. 1902.

Few biographies are more helpful than such as present the lives of men who, in private station, exhibit lofty public spirit; who, abiding in their calling, crown it with dignity and honor, and in their personal and domestic life are everything that is noble and attractive. The recent biography of John M. Forbes was one of the most notable of these, so that nothing could be more fit than that the biography of his friend, Dr. Bowditch, should come next in order. It would have ample justification (though it might have been condensed into one volume without injury) if it were only a picture of the large-natured man, the good physician, the genial friend, the enthusiastic reformer, the devoted son, brother, husband, and father, and the deeply religious soul; but Dr. Bowditch liked to write of those events of which he saw much and was an active part, and what he has written of certain phases of the anti-slavery conflict will take a place among the most entertaining and instructive recollections of that conflict, both for the future delight of the reader interested in such things and for the supplying of warmth and color to the historian's page.

Dr. Bowditch was born in Salem, Mass., August 9, 1808, and died in Boston, January 14, 1902. The son of Nathaniel Bowditch, the great mathematician, and Mary Ingersoll, he was well born in the best sense of a term often much abused. He inherited the scientific if not the mathematical vigor of his father's mind, and from his mother a profound religiousness, which in him was quite independent of a dogmatic theology. For a long time he could not feel at home in any church, partly because the recreancy of the churches as a body to the anti-slavery cause discredited them all in his judgment. He had, moreover, his period of religious doubt, and, once having lost it, he never recovered his confidence in the supernatural character of Christianity; but one would have to read many clerical biographies to come upon one so essentially religious as this is in its ultimate expression. The little Bible that his mother gave him when he was ten years old he carried about with him his whole life long, and not as a mere fetish; to read his favorite passages to his family and friends was one of his purest pleasures.

There is brief but pleasant mention of the Salem life, with pictures of the old house and garden which must have afforded him the beginnings of a liberal education before he went to Harvard in 1825, entering as a sophomore. His college work showed little sign of his mature mind and character. He entered on the study of medicine without any of that enthusiasm which was in general his most characteristic trait, and with a strong æsthetic repulsion to the dissecting room; but he was always subject to the inspiration of men of high character and ability, and in Dr. James Jackson, his chief medical instructor, he found one of these. Going to Paris, shortly, to continue his studies, he found another in the celebrated Louis. His enthusiasm for this great teacher knew no bounds. It quite outran that of Dr. Holmes, who was in Paris at the same time, and who afterwards grew up to Bowditch's appreciation of Louis's master mind. A visit to Louis in 1867 was one of the most striking incidents of one of Dr. Bowditch's later trips to Europe. While studying in Paris he had valuable experience. He saw much of Lafayette, then (1833) seventy-six years old, and dying the next year. Medicine did not exhaust his interest. He attended the lectures of the then celebrated Jouffroy, and sent the philosopher a criticism on them which was not ill conceived. In London, like Garrison and Emerson, he attended the funeral of Wilberforce in Westminster Abbey, but there was little in his emotions to predict his anti-slavery career.

His return to America was hastened by his falling in love and thereby incurring the displeasure of his father and other members of his family. Told with extreme delicacy, the story is a very pretty one, and heightens not a little the interest of a book that has no paucity of interesting matter. The only trouble was that the

home circle did not know the girl who had engaged his affection, and that his impulsive nature gave them pause. The lovers bore a year of painful incommunication, and then the son wrote such a letter as no good father could resist, and the interdict was removed. The marriage that ensued was of ideal completeness, more finely tempered in the fire of a great sorrow when, in 1863, the eldest son, Nathaniel, whom, as a child, the father had taken to Torrey's funeral and the rendition of Sims, to indoctrinate him with hatred of slavery, died in the great war fought for the maintenance and destruction of that national wrong.

Hardly less significant to Dr. Bowditch than his wedding day was October 21, 1835, the day of the Garrison mob, which made Bowditch an Abolitionist. In this character he was consciously implicated in a great reform, and liked to put on paper his impressions and his recollections of the most notable events. We may have had more exact accounts of some of them, but we have had none more vivid. When Garrison declared for disunion, as Channing had already done and as many Conscience Whigs were doing, Dr. Bowditch dissented from his particular theory, but held fast to the man and to his general work. "I believe," he wrote, "that I am almost the only one in the Board of Managers of the Anti-Slavery Society who does not go for disunion. Possibly I may agree with them at some future time, but at present we are at swords' points upon the subject. But we embrace at the same time that we fight, for we have learned to tolerate differences of opinion when honesty is the foundation." A year later he wrote: "My anti-slavery is rather of the medium stand," and five years later that, while still a member of the Anti-Slavery Board, he sympathized less and less with Garrison's disunion views, but added: "Nevertheless, to Garrison and the Anti-Slavery Society proper, I believe, belongs the honor of ever raising the standard of freedom higher. They do so by their very energy of expression of what I think to be an impracticable plan." Here is one proof, of many, of the absurdity of the too common allegation that no one could work with Garrison without being stretched on his Procrustean bed and cut down to the measure of his personal methods and beliefs.

Nothing was more characteristic of Dr. Bowditch than a vein of frolic humor which crops out frequently in his letters as it did in his life, but he could be serious and strenuous enough on such occasions as the Latimer imprisonment, the Torrey funeral, the Ottoman rendition of 1846, the Shadrach and Craft escapes, and the Sims and Burns renditions. Not even Theodore Parker was a more active member of the famous Vigilance Committee. The account of Shadrach's escape differs materially from Col. Higginson's in his 'Cheerful Yesterdays,' agreeing better with Theodore Parker's more serious view of it. Both the Shadrach and the Craft narratives are pregnant comments on Daniel Webster's anxiety about the two cases as disclosed in his just published letters. In the escape of William and Ellen Craft, Dr. Bowditch enjoyed a part as intimate as Theodore Parker's. His blood was up, and when he was taking William Craft to the place where his wife was in hiding, he pledged himself to the negro to shoot any one who should assail his liberty. The shame and horror of the Sims and Burns renditions have never been described more impressively than here. We are made, as it were, living witnesses of those monstrous crimes. It is almost a pity that the Anti-Man-Hunting League had never an opportunity to try its ingenious tactics on a kidnapper. They do not appear to have been ill-conceived.

The interest of the second volume of this biography is distinctly inferior to that of the first, in spite of a great deal of excellent matter, most of it taken from Dr. Bowditch's letters and journals. In the civil war his urgency, at first despised by Wilson and neglected even by Sumner, effected a great improvement in the ambulance system. As medical examiner of Massachusetts volunteers and substitutes, he obeyed one of the most erratic impulses of his life in branding a Canadian deserter from the British army, who offered himself for enlistment. There are interesting, but not first-hand, reminiscences of John Brown, and notes of European travel that give us pause, not doubtful, but highly satisfactory. A night walk in East London under a policeman's shield, and a visit to Strasbourg just after the bombardment of 1870, are two of the more important subjects dwelt upon. A chapter on Dr. Bowditch's "Medical Work" has the brevity appropriate to a book intended for the general reader, not for the medical specialist, but it is made sufficiently plain that he held an advanced line in his profession, both as instructor and as practitioner, especially in respect to auscultation, paracentesis thoracis, and lung and heart diseases generally. When a Boston paper made a bid for a boycott that would punish his anti-slavery activity, he registered a vow in his journal that he would live or die in Boston, practising his profession there or nowhere, and that he would have an opinion on any subject that attracted him, and express it when and where he chose. He did not think he should be prevented from doing this, and he was not.

A closing chapter tells with due reserve the story of his failing health and welcome end. A succession of portraits is convincing that the exterior semblance of the man expressed the habit of his soul.

The Story of My Life. By Helen Keller. With her letters (1887-1901), and a supplementary account of her education, including passages from the reports and letters of her teacher, Anne Mansfield Sullivan, by John Albert Macy. Doubleday, Page & Co. 1903.

Here is a biography of a deaf and blind girl written by herself—a book which can be considered from so many points of view that the choice is bewildering. To the writer of this article its chief interest lies in corroborating a long-cherished theory that the greater part of the authors of the present day are made, not born. Most of us write because other people have written, because the idea of writing is attractive; our only genius being a certain facility in combining fragments of other people's observations and ideas so as to hide the joinings and give an appearance of unity and newness. Eyes have we, but we see not; we hear not with our own ears, solely through the eyes and ears of others. In Helen Keller's life and education we have an experiment tried under perfect conditions, showing how little essential are observation and experience to the trade of author. All her knowledge is hearsay knowledge, her very sensations are for the most part vicarious, and yet she writes of things beyond her power of perception with the assurance of one who has verified every word.

It seems cruel to criticise this unfortunate girl who has made so much of nothing, whose life has been one long courageous effort to overcome her terrible disadvantages. No one can help feeling the utmost sympathy for her deprivations, the greatest admiration for her pluck. And yet the criticism must be expressed, not so much for her own sake as because her writing exemplifies in a wonderful way the disregard of a principle for which writers who have the true vocation would lay down their lives. Literary sincerity is so entirely absent from it that the subject spills over from the domain of literature into that of ethics. If she were to be judged like less afflicted mortals, we should have to call a great deal of Miss Keller's autobiography unconscientious. Here are some examples of the illegitimate use of the imagination. There are countless others:

"The glorious bay lay calm and beautiful in the October sunshine, and the ships came and went like idle dreams; those seaward going, slowly disappeared like clouds that change from gold to gray; those homeward coming sped more quickly, like birds that seek their mother's nest" (p. 225).

"The rooms are large and splendidly furnished; but I must confess, so much splendor is rather oppressive to me" (p. 227).

"I shall have to content myself with a stroll in the Gardens. Somehow, after the great fields and pastures and lofty pine groves of the country, they seem shut-in and conventional. Even the trees seem citified and self-conscious" (p. 245).

"Virgil is serene and lovely, like a marble Apollo in the moonlight. Homer is a beautiful animated youth in the full sunlight with the wind in his hair" (p. 111).

"Venus [of Medici] entranced me. She looked as if she had just risen from the foam of the sea, and her loveliness was like a strain of heavenly music" (p. 250).

Doubtless it seems unfair to call Helen Keller to account for sins which others commit unrebuked every day. It is part of her misfortune that they can be proved against her, when, in other cases, short of actual plagiarism, we can only suspect. At the great mistake in Helen Keller's life the editor points when he says: "All her life she has been trying to be like other people" (p. 173). If it could have been brought home to her that such likeness in her case could be attained only by the sacrifice of truth; if she could only realize that it is better to be one's self, however limited and afflicted, than the best imitation of somebody else that could be achieved! One sees a dawning consciousness of this great truth in one of the last letters of the book, to Mr. Copeland, her instructor in English composition at Radcliffe, dated December 20, 1900:

"I have always accepted other people's experiences and observations as a matter of course. It never occurred to me that it might be worth while to make my own observations and describe the experiences peculiarly my own. Henceforth I am resolved to be myself, to live my own life, and write my own thoughts when I have any" (p. 273).

It is a pity that she did not keep to this

resolution in her autobiography, which was presumably written after the letter.

There is another reason for regretting that Helen Keller has not confined herself to that which is within her own knowledge. In this making herself over on the every-day pattern, we lose what she could teach us by showing wherein she varies from the normal. It seems almost as if every fact of real psychological value had been perversely withheld; the few observations of importance that she does record being so mingled with her imaginings in regard to the perceptions of others as to be worthless. One resents the pages of second-hand descriptions of natural objects, when what one wants is a sincere account of the attitude, the natural attitude, towards life of one whose eyes and ears are sealed. Of what use are such records as these?—

"Mr. Chamberlin initiated me into the mysteries of tree and wild flower, until with the little ear of love I heard the flow of sap in the oak, and saw the sun glint from leaf to leaf" (p. 122).

On the other hand, some accurate observations of the manner in which the senses of touch and smell can play substitute to the missing ones would be of real scientific value. It would seem, also, as if Miss Keller's limitations might develop instinctive, indefinable powers, similar to those which animals possess; as if what we call, for want of a more accurate term, the spiritual sense, meaning the reaching out toward the unseen and eternal, might in her case yield much of interest, if not of actual value. But of such things we are told only enough to arouse the desire for more, as, for instance, when she writes:

"Frequently, as we emerge from the shelter of a cove or inlet, I am suddenly conscious of the spaciousness of the air about me. Whether it comes from the trees that have been heated by the sun, or from the water, I can never discover" (p. 120).

In another place she says, speaking of the differences between town and country, that her whole body is alive to the conditions about her (p. 124); but she does not analyze this consciousness.

Helen Keller has attained a certain facility in writing, as, indeed, almost any one would to whom it was nearly the sole medium of human intercourse. To the fine quality of her brain her achievements in actual examination testify. She is said to have wit, but the specimens given seem evidence to the contrary. She shows real penetration, however, when she speaks of toleration requiring the same effort of brain that it takes to balance one's self on a bicycle (p. 295). When she defines beauty as a form of goodness (p. 216), she is merely repeating one of those mystical sayings that have truth only for those who do not think for themselves.

The editor naïvely explains some of the contradictions in the book by reminding the reader that Miss Keller wrote many things in her autobiography for the fun of writing them (p. 283). He does not seem to be aware that he thus makes himself her keenest critic. Can there be a greater sin, from a literary point of view—not to speak of a moral one—than to advance opinions for the fun of writing them, regardless of the truth thereof?

The Private Life of the Romans. By Prof. H. W. Johnston of Indiana University. Chicago: Scott, Foresman & Co. 1903.

This is by far the best introduction to the subject which we have ever seen. Very well adapted as a handbook, to be consulted by students of the Latin authors who need to know something about the manners and customs of the men in the midst of whom these authors lived, it will serve also as a good résumé to which lecturers on Roman private life can send their classes for information on the broader outlines of their course, thus saving for themselves time to speak upon details and mere difficult points. The book is clearly written and its contents are well arranged. It lays claim to no originality, being drawn entirely from the best French and German sources; for few save Frenchmen and Germans have produced much that is original in this field. Of these a good bibliography is given. Among the twelve chapters, those on amusements, the Roman name, the development of the house, and in particular the chapter on the family, deserve special praise. A full index renders consultation easy.

There is, however, no list of the sources of the illustrations, a great desideratum in such a book, and some of the illustrations seem to have nothing to do with the Romans; for example, that of a jointed doll, found, we believe, on the Athenian Acropolis; the necklace of amulets, here called *crepundia*, which came from the Crimea; the Greek vase paintings of the mortar and pestle and of the parasol. The so-called *bisellium* is a humbug which has often been exposed, and the explanation of one of the Pompeiian forum scenes as "the sale of a slave" is a strange novelty. On the whole, the pictures are the least satisfactory part of the book. We wish that they had been more carefully selected and all relegated to a few pages at the end of the book. Then the reading matter could have been printed on a paper neither so shiny as to hurt the eyes, nor so loaded down with whatever the substance is that makes American books illustrated with process cuts such a burden to hold in the hand.

BOOKS OF THE WEEK.

Batson, H. M. A Book of the Country and Garden. E. P. Dutton & Co. $3.

LETTERS OF A DIPLOMAT'S WIFE

By MARY KING WADDINGTON

Illustrated. $2.50 *net*. (Postage 20 cents).

"*Mme. Waddington was socially experienced, and therefore she saw the significant things. She had a very human interest in all she writes about, and that gives the right kind of charm to her vivid notes.*"—Hartford Courant.

The selections from Mme. Waddington's letters to her family which have appeared in *Scribner's Magazine* constitute not more than one-quarter of this book.

"As a Henry James human document this volume is complete."—*New York Sun.*

ELIZABETH LUTHER CARY writes in the *New York Times:*

"In this latest group of stories, Mr. James presents the chosen fruitage of his genius—a product in some respects so remarkable as to make the task of presenting its qualities seem not a little presumptuous."

The BETTER SORT

By HENRY JAMES

MONTGOMERY SCHUYLER writes:

"In no book of his has Mr. James interposed fewer obstacles to the appreciation of himself than in this. In none has he vindicated more completely the position which all readers of English should be glad to accord him as a master of English letters, and which his own born countrymen, one would say, ought to be eager to claim for him."

$1.50

New Stories by "ZACK"

THE ROMAN ROAD

Comprising these three stories: **THE ROMAN ROAD, THE BALANCE, THOUGHTS.**

"As you read 'Zack's' pages you feel, beneath the surface of expression, the strong, easy, leisurely pulse of an imagination calmly exulting in its own power."—*Academy.* $1.50

Former books by "ZACK." Each $1.50

Tales of Dunstable Weir, **On Trial.** A Novel.
The White Cottage. **Life is Life.**
And Other Tales and Episodes.

THE PRINCIPLES OF MONEY

By J. LAURENCE LAUGHLIN

Professor of Political Economy in the University of Chicago, "one of the cleverest and most logical of present day writers on economic subjects."
—*N. Y. Journal of Commerce.*

"*To the banker, it will prove invaluable: to the layman, it will act as a teacher; and to both classes it will be found to be an educator of great value.*"—The Financier.

"Our object is to call attention to a valuable, informing, able and lucidly written book, and to commend with special pleasure the chapters on legal tender and the economic effects of enactments, and those on credit and deposit currency. In these Professor Laughlin is as acute as he is sound and progressive."—*Chicago Evening Post.* $3.00 *net* (postage, 22 cents).

INVALUABLE NEW BOOKS FOR NATURE STUDY

OUR NORTHERN SHRUBS

By HARRIETT L. KEELER

With 205 photographic plates and 35 pen-and-ink drawings. Crown 8vo, $2.00 *net* (postage 16 cents).

This book is a companion volume to Miss Keeler's very popular "Our Native Trees" and is designed not only for the general lover of nature, who wishes to identify and learn the habits of our northern shrubs, but for those who are engaged in beautifying public and private grounds.

TREES, SHRUBS, AND VINES

Of the Northeastern United States

By H. E. PARKHURST

With over 250 illustrations, maps, etc. $1.50 *net* (postage 12 cents).

A general account and explicit botanical details of all the native trees, shrubs, and vines of this large area, as well as the most important of foreign origin, designed for those who have never studied botany, the plants being so classified that, with the assistance of a few pages on plant structure and without a microscope, the non-botanical reader can easily familiarize himself with all the tree, shrub, and vine life around him.

IMPORTANT BOOKS READY THIS WEEK

A NEW NOVEL BY THE AUTHOR OF "THE GARDEN OF A COMMUTER'S WIFE"

People of the Whirlpool

FROM THE EXPERIENCE BOOK OF A COMMUTER'S WIFE

This charming novel, full of the sunny philosophy which made the earlier book by the same author so irresistible, contains the delightful Barbara's observations of the New Yorkers of to-day. Its title is the literal rendering of the early Indian name for dwellers on Manhattan, in reference to the rushing waters of Hell Gate. Its scenes and characters are in part those of the earlier story, now in its fifth edition. Cloth, 12mo, with eight full-page illustrations, $1.50.

A Fight for the City

By **ALFRED HODDER**, Author of "The New Americans," etc.

Mr. Jerome's dramatic campaign in the last municipal election is vividly described by an eye-witness and aid. About half of the book appeared in the shape of telling, vigorous articles in *The Outlook*.

Cloth, 12mo, 246 pages, $1.50 *net*. (Postage 10c.).

Boys' Self-Governing Clubs

By **WINIFRED BUCK**

While the author, after twelve years' experience in managing clubs organized on the lines outlined in this little book, does not claim that the club is more than one of many good influences and causes of development, she does believe that these young club graduates are more reasonable, broad-minded and wholesome in character than they would have been had they missed the club experience. Wherefore, the book is of value to all who have to do with boys in clubs or out.

Cloth, 12mo, $1.00 *net*. (Postage 7c.).

Athletics and Out-Door Sports for Women

EACH SUBJECT BEING SEPARATELY TREATED BY A SPECIAL WRITER, WITH AN INTRODUCTION BY **LUCILLE EATON HILL**, Director of Physical Training in Wellesley College.

Seventeen articles on all forms of wholesome athletic sport, ranging from *Physical Training at Home*, by ANTHONY BARKER; *Swimming*, by EDWYN SANDYS; *Golf*, by FRANCES C. GRISCOM, Jr.; *Equestrianism*, by BELLE BEACH, to *Fencing*, by REGIS SENAC. Cloth, 12mo, with over 200 illustrations, $1.50 *net*. (Postage 20c.).

Representative English Comedies

FROM THE BEGINNINGS TO SHAKESPEARE

WITH INTRODUCTORY ESSAYS AND NOTES, AN HISTORICAL VIEW OF OUR EARLIER COMEDY, AND OTHER MONOGRAPHS BY VARIOUS WRITERS UNDER THE GENERAL EDITORSHIP OF **CHARLES MILLS GAYLEY**, Litt.D., LL.D., Professor of the English Language and Literature in the University of California.

Cloth, 8vo, 686 pages, gilt, $1.50 *net*. (Postage 21c.).

Among the critical essays on dramatists represented are:

John Heywood, by A. W. POLLARD, of St. John's College, Oxford; *Nicholas Udall*, by EWALD FLÜGEL, of Stanford University; *Wm. Stevenson*, by HENRY BRADLEY, Oxford; *John Lyly*, by G. P. BAKER, of Harvard; *George Peele*, by F. B. GUMMERE, of Haverford College; *Green's Place in Comedy*, by G. E. WOODBERRY, of Columbia University; *Robert Green*, by C. M. GAYLEY; *Henry Porter*, by C. M. GAYLEY; *Shakespeare as a Comic Dramatist*, by EDWARD DOWDEN, of Trinity College.

Why the Mind Has a Body

By C. A. STRONG, Professor of Psychology in Columbia University.

The writer maintains that the way to settle this question is by metaphysical investigation of the nature of matter and mind. His book shows the mind to be the primary thing and the body to be derivative—hence the title. Flashes of humor relieve a book which, though perfectly lucid, is neither light nor superficial. Cloth, 8vo, $2.50 *net*. (Postage 16c.).

On net books ordered from the publisher carriage is an extra charge; for sale by all dealers at net rates.

Published by **THE MACMILLAN COMPANY** 66 Fifth Ave. N. Y.

The Nation.

NEW YORK, THURSDAY, MAY 7, 1903.

The Week.

The dedication of the World's Fair in St. Louis on Thursday found it in a far more prominent position than was thought possible a year ago. Even in St. Louis there were many men of standing who took slowly to the idea of another world's fair, particularly when it was planned for one of the hottest of American cities, and perhaps the most corrupt. But as the time for the dedication has approached, there has been a remarkable growth in public interest, particularly in Europe. Able as the Exposition's advance European agent, ex-Gov. Francis, is, he would undoubtedly be ready to admit that the present zeal for the Fair on the other side of the Atlantic is by no means wholly due to his clever campaign. St. Louis was fortunate in undertaking an Exposition at a time when every nation in Europe is anxious to propitiate the United States. Russia has just officially assured us that there is no nation whose trade she solicits half as earnestly as ours. The German Emperor's desire to stand well with us has had many illustrations; and the Prince of Wales has expressed the wish of the English to pay a compliment to their American cousins by sending a splendid exhibit to St. Louis. So far as this country is concerned, the extraordinary period of industrial expansion through which we have been passing insures some remarkable displays of progress in the arts and crafts. In the matter of sculpture, too, the St. Louis Fair is likely to outdo all its predecessors. But it is evident that the city must make use of the year which is to elapse before the actual opening to provide adequate accommodations for the expected crowds.

If the Missouri exposures continue, the public is likely to gain considerable valuable light on political methods there and presumably elsewhere. Senator Farris has just been indicted in Dent County for a little affair which he planned and carried out in connection with one Callahan, a Democratic editor. Farris was bent on retaining his seat in the Senate, but felt unable to secure the Dent County delegates. Accordingly, he gave Callahan $1,000, with instructions to become a candidate himself and secure the delegates. This the editor did, and promptly delivered the votes in convention to Farris. This was the main line of activity on Farris's part, but there were sundry side lines which have also been productive of scandals and indictments. He had a candidate for Congress whom he suddenly abandoned to support a man more popular with the "better element." Subsequently the abandoned candidate showed signs of satisfaction and contentment. There were also some instances of plain, old-fashioned bribery, for which suitable rewards, such as employment in various capacities at the Capital, were provided by Farris. He began public life in the humble capacity of justice of the peace, but, with methods like these, he naturally rose rapidly, until he became distinguished as the leader of the "alum" ring in the Legislature.

Just now the members of the Missouri Legislature are under fire in connection with the Baking Powder law, but some attention ought also to be given to the recent disclosures as illustrating the methods of a corporation bent on securing a monopoly. The profits of the baking powder combination in Missouri are said to have been $3,500,000 a year since 1899, when the Anti-Alum bill was passed. The passage of this law was most adroitly managed. The bill was introduced as a pure-food measure. It contained a long list of deadly drugs, arsenic, opium, etc., whose use in food products was prohibited. Inconspicuously tucked away somewhere near the end was the word alum. The Trust sent its most efficient promoter to the Capitol. He purchased such help as he needed. Members in the secret voted for the bill because they were paid to do so; many others voted for it because they were deceived as to its real meaning. When an attempt was made in 1901 to repeal the law, the Trust suddenly organized the "Health Society of Missouri," with headquarters in the law offices of W. J. Stone, the Trust's attorney. This society issued large quantities of printed matter, presenting arguments against the use of alum in baking powder. The Society was a sham, but the repeal bill was smothered, as was a similar attempt last year. Part of the monopoly has been broken by a court decision, but the combination still holds the sole right to manufacture baking powder in the State.

It begins to look, with the deepening and widening, every day, of the postal scandals, as if the President's duty were to return at once to Washington and take personal charge of a relentless campaign against corruptionists. At the very moment when, in St. Louis, he was declaring that "we must show our abhorrence of corruption, in public and private life alike," fresh revelations of rottenness in the postal service were sending out their foul odors. What is now charged, with only too much detail and corroborative evidence, is that the city post-office in Washington has been used as a kind of catch-all for the hangers-on of politicians, carried on the payroll without service performed or warrant of law; that an investigation into this crookedness was undertaken by the Comptroller three years ago, but was called off by the higher postal authorities, including the precious Perry Heath, and even Postmaster-General Smith himself. The charge of a hushed-up inquiry is practically admitted by Comptroller Tracewell to be well-founded. Now here is not simply a public scandal, but a party danger. Unless this fraud upon the public service is thoroughly laid open and disinfected, it will bring great damage to the Republicans and their President. Therefore, we say that it is for the latter to do what his Postmaster-General is evidently incapable of doing—that is, draw his official sword and make the heads begin to fall. He has spoken brave words about fearless honesty in public life; now let him, in his own phrase, make them good by fearless deeds.

The new Mayor of Philadelphia, Mr. Weaver, is taking up the details of administration there in a spirit which, if maintained against the influence of the Durham ring, may well mean better things for that afflicted city. The conviction of school officials who accepted money from teachers in return for promotions and favors, was brought about largely through his efforts while District Attorney. He has announced that he will continue his pursuit of corruption in all its forms, and is already taking steps to break up the well-known alliance between vice and the police. On the side of administrative reform, he is equally vigorous. Philadelphia has need of a considerable amount of money for necessary public improvements, and she also has a debt-limit which has been reached. The problem of providing $37,000,000 for a filtration system, the completion of the Boulevard, etc., is a difficult one. Its solution, however, is likely to be found, as in this city, in the full valuation of real estate for purposes of tax assessment, and the consequent increase of the city's borrowing capacity. The valuations in Philadelphia are now about 80 per cent. of the market price.

The Wisconsin Legislature is about to adjourn without enacting the primary reform so dear to the heart of Gov. La Follette. He has the lower house under his control, but not the Senate, and one proposal after another has been declined with thanks by the "Stalwarts," who are in the majority in that body. This result throws a curious light upon the position assumed by the Governor prior

to the election last year, when he felt himself strong enough to throw down the gauntlet to Senator Spooner, even going so far as to induce the State Convention to qualify its endorsement of the Senator for reëlection. In fact, the notion which prevailed pretty generally in Wisconsin a year ago, that La Follette could do about as he liked in legislation as well as in administration, has received several severe shocks during the present session. A bill changing the tax system as applying to railroads is expected to pass, but this is the only important measure sought by the Governor which has not met with complete neglect or defeat.

One more effort to secure undue special privileges for organized labor has fallen to the ground, this time in Illinois. In 1899 the Illinois Legislature passed a free employment agency act, establishing employment bureaus under the care of the State. The purpose of this act was benevolent and praiseworthy. It was intended to aid all persons who needed work, and also all employers. But the labor agitators got the ear of the legislators, and the act was amended so as to provide that no employer whose workmen were on strike, or who was engaged in a "lockout," should be furnished with workers by the State agencies, or be permitted to inspect the lists of unemployed persons. The Supreme Court of the State has now decided that this amendment involves a discrimination in favor of a class, and the law is consequently declared to be unconstitutional, with the result that labor has lost a legitimate benefit in an attempt to gain an end which was unwarranted and illegal.

The section of the penal code relating to hours of labor, declared invalid by the New York Court of Appeals, on April 29, was enacted in 1897, and attempted to render guilty of a misdemeanor any "person or corporation who, contracting with the State or a municipal corporation, shall require more than eight hours' work for a day's labor." Although it has taken six years formally to overthrow this enactment, it had already failed to perform the service which its advocates hoped for, and their dissatisfaction with it found expression in the amendments to the labor law adopted in 1899. These provided that in each contract to which the State or a municipal corporation was a party, a clause must be included providing for eight hours of labor only, to be paid for at the "prevailing rate" of wages; these terms to apply whether the work was done directly by the contractor or by sub-contractors. The Court of Appeals two years ago placed the ban of its disapproval on this law. Efforts for nearly a decade to fix the eight-hour rule in contracts with the State or any of its municipalities have accordingly come to naught. The attempt has not been abandoned, however. The Legislature in 1902 adopted a joint resolution proposing an amendment of the Constitution, giving the Legislature power to "regulate and fix the wages or salaries, the hours of work or labor, and make provision for the protection, welfare, and safety of persons employed by the State, or any county, city, town, village, or other civil division of the State, or by any contractor or sub-contractor performing work, labor, or services for the State or any county, city, town," etc. This joint resolution was readopted by the Legislature which has just adjourned, and is to be submitted to the people in 1905. It is fortunate that ample time will be given for general consideration of the dangerous powers thus sought to be granted.

The speakers of the Central Federated Union grow vehement over the guarantees of the Federal Constitution, but they are a trifle loose as to the solemn engagements of their own organization. The Union entered into an agreement with the Rapid Transit contractors, two years ago, in which it was stipulated that all disputes should be settled by arbitration. It is the merest quibble for the labor men now to say that this stipulation has no bearing upon the strike declared by the Rockmen and Excavators' Union, on the ground that this organization joined the central body after the agreement was made. In endorsing the strike of the Rockmen without reference to arbitration, the Central Federated Union has violated the spirit and probably the letter of its bond. This has a direct bearing upon the issue which has been raised. It may or may not be that the Rockmen have just reasons for complaint. What is absolutely certain is that, in the light of the Central Union's broken pledge, there is no chance at all that their demands, just or unjust, will receive attention on their merits. By its bad faith, the Union has raised a presumption against the strikers. If they are wisely led, they will go back to work, and seek redress, if they merit it, in the only honest way open to them as members of the Central Federated Union.

The testimony of Mr. Baer, the President of all the Reading companies, before the Interstate Commerce Commission, closed on Thursday. It gave the impression of a man of great intelligence having many difficulties to contend against, and chiefly concerned to bring a fair return to the shareholders of his company for the capital they have invested in the business of mining and transporting coal. When he says that he has never been a party to any scheme of overcapitalization in his life, it may be believed that he speaks the truth. Whatever has been done in this way with the Reading properties in the past was done before his time, and it would be difficult now to say how much of it was due to design and how much to necessity—the necessity of looking forward and anticipating the future wants of the joint Reading interests as producers and carriers of an indispensable but exhaustible article of commerce. If too much money has been paid for coal lands in the past, we must ask, before passing judgment on the buyers, what would be the condition of the property if the lands had not been bought; and so on. Human judgment is not infallible, and in such cases the appropriate punishment falls upon those who make the mistakes.

"The appeal now lies to the ballot-box." So affirms gravely the chief newspaper mourner over the Northern Securities decision. It will be extremely interesting to observe the process. First it would be necessary to catch a political party willing to attack the anti-Trust law in its platform and on the stump. Then it would be necessary to find a great body of voters who believe themselves aggrieved by the decision against the Northern Securities Company. There is no use in "appealing" to the ballot-box unless you have some prospect of getting a majority of the ballots. Every indication to-day, however, is that one small ballot-box, opened, say, at the corner of Broadway and Wall Street, would suffice to hold all the votes that might be cast in favor of abolishing the anti-Trust act. The same newspapers that are going to induce the people to vote down a highly popular law, are also, we observe, about to bring about, in a similar way, the repeal of the Fifteenth Amendment. Thus they would "appeal to the ballot-box" in order to shut off that appeal in the case of a million or more legal voters.

"When we present petitions to Congress and pray for relief, we are told to go to the courts, because legal questions are involved. When we go to the courts, we are told to go to Congress for relief, because it is a political question. When Congress grants any of the relief prayed for and the Southern white folks take it to the courts, the courts decide that the act of Congress is unconstitutional."

This is the striking way in which the colored editor of the Richmond (Va.) *Planet* sums up the political condition of the negro, in commenting upon the decision of the Supreme Court in the Alabama case. But he continues: "We negroes have taken the other path now, and expect to emerge on the table-land of financial success and industrial prosperity." This is precisely the wise counsel given by Booker Washington. At the same time, the political cause is not yet lost. Last week's decision, shuffling as it was,

is not the only one which the Supreme Court must give. At least four other suits are pending, and the highest tribunal must be agile indeed if it avoids the real issue in every one. Moreover, there are multiplying signs that Congress will take some action when it reassembles next December. If the Supreme Court insists that violations of the Fifteenth Amendment do not concern it, a Republican Congress cannot turn a deaf ear to the negroes of the South without doing violence to its best and noblest traditions. There is proof in plenty of the injustice of the disfranchising laws, and of the still graver injustice which everywhere marks their enforcement.

A trustworthy Havana correspondent of the *Evening Post* throws an interesting light upon some of Gen. Wood's operations in Cuba. It now appears, for instance, that the remarkable article which was printed in the *North American Review* for January, 1900, over the signature of Lieut. James E. Runcie, United States Army, retired, was deliberately instigated by Gen. Wood, and that the manuscript bore corrections in the handwriting of that officer. The worst part of this offence lies in the fact that the article attacked Gen. Brooke, Gen. Wood's superior, in the most unmeasured terms, and denounced him roundly for his failure properly to govern the island of Cuba. When the article appeared, Gen. Brooke had already been removed, and been succeeded at Havana by Gen. Wood. But the article was so plainly a violation of military decency and discipline that Secretary Root ordered Gen. Wood by cable to call Lieut. Runcie, who had accompanied Gen. Wood from Santiago to Havana, to account for it. This was done, with the result that Lieut. Runcie was removed from several commissions and offices in which, according to Gen. Wood, he was doing most valuable work for the military government. Now it appears that Gen. Wood was as guilty as Lieut. Runcie. This matter is properly one to come before the Senate Military Committee if President Roosevelt insists upon advancing Gen. Wood to the rank of major-general during the coming summer.

It is not necessary to hold the sacramental view of marriage in order to sympathize with those English prelates and clergymen who are so scandalized by the Vanderbilt wedding in church. Let the canonical position be what it may, even those who regard marriage as a civil contract may well be disgusted by the tendency to make hugger-mugger of the family relation, and to give divorce the air of being simply an easy means, for the rich, of changing partners in marriage as you would at a ball. This is the shocking thing. It affronts, not merely sacerdotalism, but ordinary decency. There is no surer sign of the insidious invasion of luxury, ever seeking a new sensation for its jaded nerves, than the growing laxity about marriage. Let any man of middle life recall the social penalty visited upon divorced persons a generation ago, and compare it with the cynical indifference which prevails, as regards even the most flagrant cases of off with the old wife (or husband) and on with the new, in those circles where wealth is the sufficient passport. The difference is as notable as it is painful.

The Cobden Club is not favorably impressed by the publications and other movements of those who are alarmed lest the food supply of Great Britain be endangered in time of war. It has issued a leaflet prepared by Mr. Harold Cox, its Secretary, in which the arguments of the "scaremongers" are reviewed. In the first place he shows that all of these arguments are based upon the theory that an interruption in the supply of wheat from foreign countries would mean famine to a large part of the population, whereas it would at most mean only a change of diet, as, from wheat to oats, potatoes, meats, and other kinds of food. The shortage would of course be felt as a deprivation, but it would not mean famine. The price of all kinds of food would rise, but such a rise in price would not be England's first experience. During the Crimean war the price of wheat rose from 53s. 3d. to 74s. 8d. Again, in 1872, the price of bread rose from natural causes from 5½d. for the quartern loaf to 10½d., yet the period was not marked by any exceptional distress. It is said that, in case of war, the food supply from foreign countries would be cut off by the enemy's cruisers. Mr. Cox points out that food is not contraband of war except to cities actually besieged, and that neutral ships could not be molested by the enemy without embroiling himself with neutral nations. The higher the price of wheat, the more eager would the producers and holders of that cereal be to send it to the British market. America, for example, would not tamely submit to having grain-laden vessels stopped on the ocean and prevented from carrying on a commerce which is recognized as lawful. It has been proposed by some persons that the Government should organize a system of buying and storing a large supply of wheat for emergencies of war. This Mr. Cox shows to be quite unnecessary, for the reason that wars do not come suddenly, and that merchants would accumulate all needful stocks on the first signs of war. They would do this for purposes of profit, but they would also take the risk of loss. This would be the natural course, and much better than Governmental interference.

The news of the week relating to the Mantchurian question converges to the one point that Secretary Hay's protest against the Russian programme was the chief reason why it was disavowed. Japan has telegraphed her thanks, and Ambassador Cassini has conveyed not exactly thanks, but the good will of his Government and himself, in large measure. Still later information implies that the so-called demands made upon China by Russia were merely inquiries. What would China do or say if Russia should do this or that? Thirst for information is a very different thing from a demand that Chinese ports shall remain closed, or that no more foreign consuls be allowed in Mantchuria. This explanation, it is said, involves no retreat from any position officially taken by Russia. Of course not. The only positions taken by Russia are those taken at St. Petersburg. Requests for information may be as plenty as blackberries at Peking, but they do not commit the Czar's Government to any policy whatever. All this is agreeable news at Washington, but it will be still more satisfactory when Russia carries out her agreement for the evacuation of Mantchuria. Meanwhile, news coming directly from Peking says that the Russian Chargé d'Affaires has issued a denial similar to that of St. Petersburg. He states that his communication was misconstrued, and that the only conditions formulated by him as precedent to the evacuation of Mantchuria are those necessary for the protection of Russian interests. This is so extremely vague that it may include anything, from complete evacuation to complete and permanent occupation. It leaves the same conviction in the minds of observers that all other events in that quarter have produced—that Russia will retain as much of Mantchuria now as she can hold without being obliged to fight for it, and that some time she will get the whole.

It seems that Premier Combes has found it necessary to draw the line somewhere in his movement against the religious orders in France. At all events, he has drawn such a line at Lourdes. Whether the considerations which caused him to make an exception here are financial or religious, is not made clear. The pilgrimages to Lourdes brought a great deal of money to that locality. The miracles that the pilgrims took back may have been of doubtful efficacy, but the gold that they left there and distributed *en route* was as good as any that ever came from the mint. To abolish both miracles and mint drops at one time is more than human nature should be asked to endure. It was wise on the part of the Premier to refer the matter to the courts, or, at all events, to wait until the question, already before the courts, is finally decided.

STRIKE-COMMISSION LOGIC.

When the abstract of the Anthracite Strike Commission's report was published, we felt and expressed the sense of a lack of connection between the Commission's findings of fact and its awards. It seemed not to have a clear case for the increase of wages which it adjudged the miners. Yet it was, of course, possible that the abstract did injustice to the reasoning of the full report, and so we suspended judgment, awaiting the appearance of the latter. We have it at last, Bulletin No. 46 of the Department of Labor, and are surprised to find that the hiatus between premises and conclusion is even more glaring than we had supposed. The Commissioners discredit and reject almost the entire case which the miners attempted to make out for an increase of wages, but award them the increase nevertheless.

This will seem a strong assertion, but it may easily be justified. The shortest and most convincing way to do it is to set forth in parallel columns the arguments of the miners' counsel and the remarks of the Commission upon them, in the light of the evidence adduced. Such an exhibit follows:

THE CLAIMS.	THE FINDINGS.
"(1.) The present rate of wages is much lower than the rate of wages paid in the bituminous coal fields for substantially similar work."	"As to the general contention that the rates of compensation for contract miners in the anthracite region are lower than those paid in the bituminous fields for work substantially similar, or lower than are paid in other occupations requiring equal skill and training, the Commission finds that there has been a failure to produce testimony to sustain either of these propositions."
"(2.) The present rate of wages is lower than is paid in other occupations requiring equal skill and training."	"We do not find that testimony has been adduced which would permit satisfactory comparison with earnings in the bituminous coal fields."
"(3.) The average annual earnings in the anthracite coal fields are much less than the average annual earnings in the bituminous coal fields for substantially similar work."	"We find that the average daily rate of earnings, as nearly as can be ascertained, does not compare unfavorably with that in other occupations requiring substantially equal skill and training."
"(4.) The average annual earnings in the anthracite coal fields are much less than the average annual earnings for occupations requiring equal skill and training."	"The statistics so far available do not show a greater hazard than obtains in some other occupations, notably in the fisheries and in those of switchmen and freight-train crews on our railroads."
"(5.) The rate of wages in the anthracite coal fields is insufficient in view of the dangerous character of the occupation."	"The Commission finds that the conditions of the life of the mine workers outside the mines do not justify, to their full extent, the adverse criticisms made by their representatives."
"(6.) The annual earnings of the mine workers are insufficient to maintain the American standard of living."	"The contention that the increased cost of living has made it impossible to maintain a fair standard of life upon the basis of present wages."
"(7.) The increased cost of living has made it impossible to maintain a fair standard of life upon the basis of present wages."	"(8.) The wages of the anthracite workers are so low that their children are forced prematurely into the breakers and mills."
"(8.) The wages of the anthracite workers are so low that their children are forced prematurely into the breakers and mills."	"(9.) Wages are below the fair and just earnings of mine workers."
"(9.) Wages are below the fair and just earnings of mine workers."	"It is impossible to be accurate in this matter."

There is the whole case. Those nine arguments were the only ones put forward by the counsel for the miners or considered by the Commission. And what we ask is, Who, on reading the findings, as set over against the claims, could doubt that the miners would be turned out of court without a leg to stand on? Who, hearing a judge thus sum up so heavily against a claimant, could doubt that it was preliminary to dismissing the case summarily? Yet, in fact, "The Commission, therefore [note that astonishing *therefore*], considers, and so adjudges and awards: That an increase of 10 per cent. over and above the rate paid in the month of April, 1902, be paid to all contract miners for cutting coal, yardage and other work."

Nor does a reading in detail of the Commission's report, in the part that relates to wages, diminish our wonder at the way in which it "made the praise and glory of God come out in the conclusion, no matter what the premises." Its investigation of the rise in the cost of living was particularly searching. The miners contended that this rise, in the anthracite regions, had been 30 per cent. between 1900 and 1902. But careful inquiry and collation of facts by the Department of Labor showed that the real increase was only 9.8 per cent. That is to say, the 10 per cent. increase in wages which the men received in 1900 had not been eaten up, as they alleged, by a 30 per cent. increase in the cost of living. Similarly in regard to the irregularity of work. The Commission found that, in the past, the idleness of the contract miners was often their own fault, and that "it may be reasonably expected that the future demand for anthracite coal will keep the industry at its present point of activity"—that is, where it furnishes full employment for a large part of the year.

President Roosevelt in Omaha held up the report of the Strike Commission as a model. He certainly could not have meant a model of logic. When it came to announce its verdict, it quietly turned its back on the evidence and its own analysis of it. The real "therefore" of its conclusion was unexpressed. It did not relate to the argument or the testimony which the Commission heard—that its own report betrays—but to the general expectation, or to a desire to make the arbitration a success, or possibly to political motives, half consciously influential. At any rate, the Commission has given out a document which is as interesting psychologically as it is industrially. It shows how the human mind will work. And as for the Commission's severe and solemn arraignment of trades unions for violence and murder, what attitude towards that can it expect the men to take, after the gross partiality of its award in their favor, but that of the Irish vixen in Miss Edgeworth's play? "Give me leave," said the magistrate, "to advise you a little for your good." "Plase, your Honor," cried Catty Rooney, "it's no use—from a child up I never could stand to be advised for my good!"

EXPANSION AND EXPANSION.

President Roosevelt's address at St. Louis on Thursday had a vigorous swing and was marked by a rough-and-ready philosophy. He was on his own ground, both personally and as an historian, in describing the winning of the West; and his strong and iterative phrases savor of the caravan and the camp and the forest settlement. His main argument, moreover, is perfectly sound. The men who came to this country with empire in their brains had to have room to grow, and their push westward was like that of an irresistible tide. That they did not break off, governmentally, from their parent States, was more the work of the inventor than the statesman. But for steamboat and railway and telegraph, Oregon and California would never have consented to be governed from Washington. Mr. Roosevelt did not dwell upon this, but he was eminently correct in picturing American expansion as that of a great democracy over contiguous territory, where free institutions and self-government went west with the sun.

Neither President Roosevelt nor ex-President Cleveland, in speaking of the expansion of 1803, referred specifically to the expansion of 1899; but it was obviously lurking in the back of both their heads. "We have never," said Mr. Roosevelt, "tried to force on any section of our new territory an unsuitable form of government." He was plainly making a tacit apology for our course in the Philippines. "We memorialize," declared Mr. Cleveland, "a peaceful acquisition of territory for truly American uses and purposes." The reference is clear to an acquisition by force for un-American ends. Again the Philippines! The subject will not down. Americans cannot meet anywhere to celebrate the triumphs of free government, without an awkward pause, a look askance, as the conquered Filipino thrusts forward his manacled hands, asking, "What are you going to do with me?"

President Roosevelt did well to cite the example of expanding Rome as one for us to avoid. He did not, however, say just what were the evils of Roman

expansion, or how nearly we are paralleling them in the Philippines. They were, of course, mainly the ruthless exploitation of distant lands and peoples. The provinces were the prey of rapacious prætors—the politicians with a "pull," of their day. Everything was to be wrung from them, nothing given. As Tacitus said, the Roman colonies came to mean not a collection of human beings, but a mere symbol: so many colonies, so much plunder. In like manner, the Philippines have now become to our ruling class—the men who create and fill offices and grant franchises—simply a new country to be overrun and exploited. At the very moment when President Roosevelt was lauding self-government, the telegraph was bringing word of another embezzler in the Philippines. "O. G. Milne, postmaster of Tacloban, Leyte, has been convicted of misappropriating funds." What is an American doing there? If his name were Quintus Paulus, or even José Sanchez, we could understand that it was simply a case of colonial robbery, but O. G. Milne! "These French names," said Thierry, apropos of the Canadian rebellion of 1837, "cut me to the heart." So we say of these American names of Philippine oppressors.

Neither the passage of time, nor the apparent indifference and acquiescence of the people, can really change this question. Principles remain and facts are what they are. We are only proving the truth of what the author of 'Representative Government' long ago told us—namely, that "such a thing as a government of one people by another does not and cannot exist." Mill added—and this day is his prophecy fulfilled in our ears—"One people may keep another as a warren or preserve for its own use, a place to make money in, a human cattle farm, to be worked for the profits of its own inhabitants; but, if the good of the governed is the proper business of a government, it is utterly impossible that a people should directly attend to it." The work has to be done by delegates; and the history of the world shows that irresponsible and arbitrary delegates, in remote lands, degenerate, as we have seen too many of our representatives in the Philippines, into cruel and extortionate masters of the enslaved. Froude was not a man to cherish humanitarian scruples or democratic prejudices, yet he wrote that, "if there be one lesson which history clearly teaches, it is this, that free nations cannot govern subject provinces."

By whatever door we go in, here is where we always come out. The acquisition of the Philippines was a violent break with all our best American traditions. It was wholly out of line with our historic expansion. None of the arguments which justify the latter can throw a mantle of decency about the former. It was a bloody conquest of an inoffensive people; and in order to align that with the expansion of the United States, you must first burn the Declaration of Independence and wrap your cartridges in the Sermon on the Mount.

FORGETFULNESS OF REPUBLICS.

The well-known publicist, Gabriel Hanotaux, gives the following explanation of his purpose in writing a comprehensive history of 'Contemporary France': "Every day," he says, "democracy is required to settle the most arduous problems, and fails to remember that they have been raised a hundred times already, and that the answer has already been given by itself only yesterday." For his own country, he proposes to afford "a sufficient quantity of definite information, of documents which have been checked, of precedents which have been verified"; and he sets before himself the serious task of making the French democracy "pause one moment for reflection and consider its own acts and deeds, which, in proportion as they are left behind, become history." It is a novel and an ambitious enterprise, this of forcing a republic to take account of its own precedents and tendencies. It is also a useful task, for republics are as certainly forgetful as they proverbially are ungrateful.

This forgetfulness, which too often prevents republics from profiting by their own past experience, is probably closely bound up with the party system. Monarchies offer, at least theoretically, a personification of the nation, independent of and above party. Traditions and precedents gather about a royal house as they cannot about a government which is identified with a party. How shall there be any settled continuity where the avowed policy of each new administration may be to undo the work of the last? But this neglect of the lessons of history, if a natural defect in republics, is by no means inevitable or irremediable. It prevails in an alarming degree only when the leaders of public opinion fail signally in their duty of reading the present in the light of the approved teachings of the past.

What a difference it would make in our most vexatious political and social questions, if, instead of treating them as new problems, we could realize that they are all old, and most of them partially solved. Our Southern fellow-citizens, and many Northerners, are to-day treating the matter of the negro's rights as if it were an open question, as if the anti-slavery movement, the civil war, the consequent amendments to the Constitution had settled nothing. A very little consultation of history within the experience of living men would show so clearly whither tends every unfair effort to keep down the colored man, that the most violent advocate of "white man's government" would shudder at the future he is preparing for his children. The civil war settled more than slavery; it put the nation squarely on record for political equality, irrespective of race. The principle may be temporarily evaded by chicanery, it may be confused with the unwarrantable assumption that the political equality of the negro carries with it *pari passu* his social equality; but so doing, a movement is bruising itself against the hard wall of an adjudicated fact. Where slavery proved impossible, no theory of a liberal serfage can be permanently worked. A very little reference to the history of the white man's dealings with the negro would show that the real question which confronts the South is not how to dispose of the negro for the next few years, but how to avoid the calamitous results that must follow any settlement of that difficult problem which will not for all time be just.

Ordinary sagacity will consider the results of tried policies when a familiar case recurs. If as much hindsight could be enforced upon politicians as prevails among physicians or bank officials, our outlook would be happier than it is. But broader historical retrospect will lead to toleration, and should readily be convertible into practical wisdom. President G. Stanley Hall, addressing the Massachusetts Historical Society in January last on "The Relations between Higher and Lower Races," said:

> "Our democracy needs a type of historical study that glimpses these larger questions, and, while hopeful, does not assume that we are the *beati possidentes*, or our age the culminating period of history, but rather that its brighest pages are yet to be written because the best and greatest things have not happened yet. Nor does this necessarily imply that even our own blood or our own institutions will dominate the far future. In many lands the victims have been the real conquerors. In later ages other stocks, now obscure, and perhaps other tongues now unstudied, will occupy the centre of the historic stage, appropriating the best we achieve, as we learn from the Semites, Greeks, and Romans. If this be true, every vigorous race, however crude and undeveloped, is, like childhood, worthy of the maximum of reverence and care and study, and may become the chosen organ of a new dispensation of culture and civilization. Some of the now obscure may be the heirs of all we possess, and wield the ever-increasing resources of the world for good or evil, somewhat perhaps according as we now influence their early plastic stages."

In the turmoil of life in a new republic, few attain to so philosophical an outlook. All the more urgent their duty to enforce the easier truth that genuine progress comes only when past experience guides present policy. The republic which treats all things as if they were new, is like an insurance company that should systematically disregard its actuarial tables.

THE SPECIAL FRANCHISE TAX.

In the year 1899 the State Legislature passed a law classifying as real estate, for purposes of taxation, every franchise or right to use a public street or highway for purposes of gain. These

were termed *special* franchises to distinguish them from the general franchise or right to be a corporation. The right to occupy a street or highway for a special purpose, such as a railway, on, or over, or under, the surface of the ground, or for a pipe line to convey gas, steam, oil, or electricity, is something over and above the right to be a corporation, and is frequently the main thing, the *sine qua non*, that gives value to the corporation. The Legislature in 1899 for the first time sought to make this kind of value contribute to the public expenses at the same rate as other tangible and immovable property. It accordingly passed a law which made these special franchises taxable in the same way as the adjoining houses and lots; the value of each franchise to be assessed by public officers.

The litigation which followed the passage of this act reached its final stage on Tuesday week, so far as the State courts are concerned, in a unanimous decision of the Court of Appeals affirming the Constitutionality of the act at all points. It is said that the corporations affected by it will now take an appeal to the Supreme Court of the United States. If the latter tribunal should be convinced that it has jurisdiction of the case, it may go so far as to review the finding of the highest tribunal of the State, but it is hardly possible that it should reverse that finding. It is a rule of the Supreme Court, we believe, that, in the interpretation of a State law, it will follow the latest settled decision of the courts of that State. The unanimous decision of the New York Court of Appeals must be considered a settled decision of the State, so far as anything can be considered settled in this world. Hence there is small ground for expecting that the decision just rendered at Albany will be reversed.

That the corporations expected that the validity of the tax would be upheld was made manifest by the very slight disturbance of values on the Stock Exchange. The steadiness of the market proves also that no substantial injustice has been done by the tax." If, after all the water that has been poured into Metropolitan Traction and Manhattan Elevated, the shares are still bought and sold far above their par value, sympathy is obviously wasted upon them. The owners of these shares have not made as much money as they expected to make. They have not been able to control the law-making power to the extent that they hoped to do. They will have to pay taxes hereafter as do private owners of real estate. This will be a great gain to the city treasury, and it is not unlikely that other American cities and States will avail themselves of this new source of revenue. We observe that Gov. Odell, *en route* to St. Louis, said at Indianapolis that he was not surprised at the decision. As he recommended, in his last annual message, that the franchise tax be repealed and a tax on gross receipts be substituted in place of it, we cannot assume that he was gratified by it.

The reason why the tax provided for in the Ford law (the special franchise tax) is preferable to a tax on gross receipts is that it is more just, and will yield a far greater sum to the public revenue than the other. It is more just because it puts the private owner of real estate and the corporate owner on a footing of equality. It will yield a greater revenue because the percentage of gross receipts collected would probably correspond to the percentage levied on other property, say, 2½ per cent. If a company's gross earnings are $100,000 per year, the tax (on the gross earnings plan) would be $2,500. But the total value of the property, in such a case, would probably be as much as $500,000, and a tax on this capital would be $12,500. The private owner of real estate is taxed not on the gross receipts from the rents of his property, but on its gross value, and this he must pay even if it yields no rental. This distinction between gross rental and gross value is not generally understood, but to those who look below the surface it is plain that Gov. Odell's argument for a tax on gross receipts instead of the franchise tax is altogether fallacious.

The decision of the Court of Appeals in this case harmonizes in a broad way with that of the Circuit Court of the United States in the Northern Securities case. It is another sign that public opinion demands the putting of a curb on corporations, not in an indiscriminate mad rush, but in a safe and orderly manner, so that the rights of individual men shall not be submerged under vast combinations, or the social movement clogged by the concentration of wealth in a comparatively few hands when it is accomplished in contravention of the principles of the common law. It has been, indeed, the apparent inability of the country to pause anywhere in the career of merged mergers, upon which it seemed to have madly entered, that has most impressed foreign financial observers, and most alarmed thoughtful Americans. On every hand we heard of absorption and over-capitalization, but where were the *vestigia retrorsum?* Well, the United States Circuit Court showed how one combination might be broken up. The New York Court of Appeals has given the people another hook to put in the nose of Leviathan, if they wish. It has been found, that is to say, that the creatures of law are not above the law. The sovereign power which charters can control. The law-making body which grants privileges, can tax the wealth which results from them. It is simply the discovery of those truths, now supported by the highest judicial authority, which has carried so much dismay into certain financial and political circles.

What they fail to see is that the only alternative to a measured and orderly control of corporate power is either revolution or Socialism. Socialists are not the only ones to have discovered the powerful impetus given to their cause by those who have laid railroad to railroad and industry to industry. The final jumping-off place of such aggregations of capital is, too obviously, national ownership. They would either break down in private hands, or else break the nation down. To take them over by the State would not necessarily mean confiscation. Expropriation would do the work, as we see it attempted to-day in Ireland. The private owners would get a price, though not for their water, and then they would be taxed smartly, by graduated income taxes and otherwise, to help pay the bill. That is plainly the Socialistic programme; and that towards its accomplishment the corporate tendencies of the day make inevitably, we do not see how any man who keeps his eyes open can deny. For our part, it is just because we believe with all our hearts in individualism and competition—in other words, in liberty—that we can but hail every proof that the people have not surrendered the power to deal as they will with the corporations of their own creating. If they could not, we should advance with accelerated pace towards that State Socialism which, to our mind, spells tyranny.

There are, of course, some things which laws and courts cannot do. They cannot make men's talents equal. They cannot prevent the higher capacity from winning the higher reward. They cannot permanently check the inventor or the initiator or the captain of industry. In short, they cannot remodel human nature or do away with economic law. But the law can compel its own creatures to be law-abiding. As an instrument in the hands of the people, it can make artificial beings like corporations subserve the general good. If the Northern Securities decision, and the opinion of the Court of Appeals as to the franchise tax, are (as they have been called) "backward steps" only in that sense, then we consider them among the most wholesome and hopeful ever taken.

THE KAISER AT ROME.

Even Bismarck, after his proud "We will not go to Canossa," lived to need and seek the political aid of German Catholics. It is not strange, therefore, to find the Emperor William, in the pursuit of the great policies which he has at heart, going all the way to Rome. His visit to the Vatican—for it is obvious that his real destination was there, and not the Quirinal—was made as imposing as outward pomp could render it, and falls, unquestionably, at a most significant crisis. We do not refer to

any domestic difficulties of Germany, as touching Catholic questions. Embarrassments exist in connection with the return of the Jesuits, which Von Bülow promised to permit in return for necessary Clerical votes in the Reichstag, and there are certain aspects of the school and university questions which are making trouble; but these are only minor and incidental matters.

What the Kaiser is really thought to be concerning himself about is a much larger question. It relates to his vast colonial schemes, and has to do especially with the prestige of Germany in the Orient. In a word, he is apparently bent on supplanting France as the titular protector of the Catholic Church in the East. Just at present, the relations between the Vatican and the French Government are exceedingly strained. The harsh enforcement of the rigid law against the religious orders in France has led not merely to many incidental hardships, but to a great deal of bad feeling and indignation. The advisers of the Pope might well urge him to break with a republic that had shown itself so ungrateful for Leo XIII.'s aid in consolidating its power at home, and at least to refuse it the honor of posing longer as the official defender of the Catholic faith in the Orient. At this juncture, the Kaiser comes forward to offer the services of Germany, at a time when, as he said in one of his speeches in Palestine, five years ago, "the German Empire and the German name have now acquired throughout the empire of the Osmanli a higher reputation than ever before."

France has had distinct warning that she could not go on flouting the Holy See at home while representing it abroad. When the Law of Associations, aimed at the Catholic orders, was still pending, the Pope wrote a letter to the Cardinal-Archbishop of Paris, in which he made a very significant reference to the protectorate which France exercised over Catholic missions in the East. French Catholic missionaries, observed his Holiness, had done an incalculable work in extending, with the Gospel, "the name, the language, and the prestige of France" throughout the ends of the earth. The Pope was arguing, of course, that a country bound by such ties to the Church ought not to appear as its persecutor. And the fair inference was that if, in spite of the warning, a doctrinaire anti-Clerical Government went rashly on in the work of expelling Catholic monks and sisters from France, the Vatican would be compelled to seek another protector in the Oriental world.

How important, in a governmental and commercial way, the official connection with the Holy See has been to France, it would be easy to prove from the writings and speeches of French economists and statesmen. M. René Pinon, writing recently in the *Revue des Deux Mondes* of the stake of France in the extreme Orient, said that "it is a mere commonplace to affirm that a long and historical coöperation has rendered the interests of France and those of the Catholic Church inseparable." Scarcely a debate takes place in the Chamber on the policy of the Government, as respects colonizing and trade in Syria or China, which does not bring from the Foreign Minister an acknowledgement of indebtedness to Catholic missionaries. M. Delcassé spoke in that sense, not long ago, when French influence in the Turkish Empire was under discussion. It is thus a serious blow to France which the Vatican would be able to deal in giving another the rôle of protector of the Catholic Church and Defender of the Catholic Faith.

What qualifications has Protestant Germany to take up the work, in case it is removed from the hands of nominally Catholic France? Going beyond the first incongruity of the idea, we see how the thing would fit in with German plans and aspirations. In Syria and throughout all Mesopotamia, German railway enterprises are taking on a great importance. In China, the Germans are exploring and exploiting their holdings in a fashion which shows that they mean to stay, and to claim new consideration in all Eastern questions. With a restless and versatile Emperor, a growing naval power, and a nation bent on great schemes of trade and colonization across the sea, it is evident that Germany could both get and give aid in such an alliance with the Papacy as that which France has long enjoyed, but seems now to be on the point of losing. It is not impossible, therefore, that, on his next journey to the Turkish Empire, the Kaiser may announce himself not only as the friend of the Sultan and the defender of the Protestant faith in Palestine—such he proclaimed himself in 1898—but the chosen representative of the Holy See as well.

THE "MUNICIPALIZATION OF BREAD" IN ITALY.

NAPLES, March 23, 1903.

All Italy is discussing an experiment in what is called by the awkward title of the "municipalization of bread"—that is, the assumption on the part of local authorities of the business of baking and distributing to its inhabitants all the bread consumed within its limits. The Italian Government's monopoly of certain lines of enterprise, of which the cultivation and manufacture of tobacco is the most conspicuous example, has made the logical transition to governmental control of other industries intelligible to even the most ignorant and thoughtless. In several of the small towns, from time to time, the local authorities have taken upon themselves, for longer or shorter periods, the functions of a public bakery. This has usually been (as in the little town of Positano, on the northern shore of the bay of Salerno, three or four years ago) as a temporary expedient during strikes. At that time, the bread manufactured by the town was of a better quality and cost less than what the bakers had provided. On the settlement of the strike the *municipio* ceased its interference. At the present time Perugia owns and operates both a mill and a bakery, and Forlì a bakery; but no large city of France or of Italy has undertaken such an enterprise until, quite recently, Catania. The experiment of Catania has been watched far beyond the bounds of Sicily, and from Milan to Naples people are measuring its success and discussing the desirability of following her example.

To show how vital this question of good and cheap bread is, the condition of the inhabitants of Positano may be taken as an example. Like the greater part of the towns of Southern Italy, it has been left behind in the march of the world's progress. Its young men leave their homes, the guide-books have been saying, and travel through the ex-kingdom of Naples as hawkers; but now it is nearer the truth to say that of its 3,000 natural inhabitants more than a third are in New York. "With the exception of a few boatmen, the population therefore consists chiefly of old men, women, and children." The old women, with distaff and spindle and old hand-looms, make a coarse sacking from refuse hemp, and earn a lira a day. The young women have been taught lace-making in the public school, and their cushions and pins may be found in all the houses. Their work is slower and more exacting, and they earn even less than a lira a day. The shoemaker works more than two days making by hand a pair of low shoes, walks to Sorrento, two hours distant, to buy his materials, for which he pays more than four liras, and then asks seven liras for his product—hardly more than a lira per diem. The letter-carrier, barefooted and ragged, a span-new leather pouch his only badge of office, is paid half a lira a day, and receives a dole at the door when he brings a package or registered letter. How can he live on his wage? He doesn't; fortunate man, he has a hard-working son in New York. But the women who bring down large bundles of fagots on their shoulders from the mountain villages do not seem to earn more than the postman, if one may judge from their bare feet and legs and their patched, short calico dresses.

What do these people eat? It begs the question to answer, as some one did, "They eat New York." For breakfast one eats five centimes' worth of bread—a cent's worth; at noon, more bread, a raw onion or tomato, or occasionally a piece of fish, and this costs a man twenty centimes. At night he may eat macaroni with a vegetable, beans or polenta (cornmeal mush), and bread and perhaps a little wine; and this costs him sixty centimes. If one adds three cents for contingencies, rent, clothing, et cetera, the lira a day is consumed. Fuel to keep himself warm he never has, rarely needs. His home usually has but one or two rooms, and, if he has not inherited it, he can hire one of three or four rooms, rather weak in doors and windows, yet habitable enough in this climate, for four cents a day. A quart of wine, costing nine or ten cents, lasts a moderate man a week. He may choose bread and water for breakfast and supper, and a minestra, a meal of soup, made of bread and water and vege-

tables and a little fat. A few figs or a little fruit, an orange, or a medlar or two, may sometimes afford a change of diet; all, perhaps, grown just outside his door. Bread, then, is his mainstay—bread bought of the baker in this land of fireless houses. Every soldo's worth of fuel is carefully reckoned where such numbers of people live in great misery. A few sticks kindled in a corner on the stone floor is enough to warm the minestra, and a few bricks taken from the wall above lets the smoke out, if not so successfully as most chimneys. In few houses of the poor can be found a stove that will bake bread—at best there is only a brazier. A few buy a little flour, mix it crudely, and take it to the baker's and pay him so much per kilo for baking it in his oven. It is a hard, unpalatable-looking thing, which requires much soaking in water before it is eaten. If these are the conditions in which all but a few in Positano live, how can they be much better in Naples, where half a million people have even less elbow-room? Meat they rarely can have, except haply at Easter or Christmas, and eggs are all but unknown. No wonder they kill even the song-birds for food.

As in France, almost every Italian town has its tax-gatherers stationed at its approaches, levying an impost chiefly on whatever is used for food. Not long ago a law was passed making it obligatory for all towns, whenever their finances had reached a certain degree of prosperity, to abolish the "dazio," as this toll is called. This law took effect, as far as Catania was concerned, the first of last July. About the same time there was a change in the personnel of the city government. The citizens expected that a fall in the price of bread would follow the abolishment of this tax on flours and meals, but the bakers formed a union and maintained prices. There was enough indignation to induce the new city officials to make an investigation of the question of both cost and quality. In consequence, they demanded a reduction in the price of ordinary bread five centimes on a kilo. The bakers refused, in spite of popular feeling and the suffering caused the poor; and, forming a still stricter union, they threatened not only a general strike, but also an increase of four centimes in the price of a kilo. There was little inclination under these circumstances for a purely academic discussion such as has been going on in Naples, and as would be worth stopping to consider if your space permitted.

On the refusal of the local bakers to accept the conditions made by the city, there was great popular indignation, and when the authorities insisted and declared their intention of opening public bakeries to provide the people with bread, many citizens freely offered their assistance. Brick ovens are found in not a few of the better private houses, and these were offered for the city's use, and many of the smaller shops offered to sell without accepting the proffered commission of 5 per cent.; others gave their services in the actual process of bread-making. A single large bakery was secured. Seeing that their side was losing the contest, the bakers applied to the city for employment, and, out of compassion for their families, they were given work both in the municipal bakeries and in retailing the bread on commission. Then they attempted to ruin the movement by spoiling the bread in the baking, and by selling it only after it had grown stale. Finally, they tried to starve out the town by deserting the bread in the dough. Discharged from the city's employment, they assembled and requested to be allowed to reopen their shops. This was permitted, but they found that they could not compete with the city, for the simple reason that a single large establishment, producing exceptional quantities and exacting only a small profit on every hundredweight, can succeed where a smaller undertaking fails in the effort to give the same quality at the same price. Instead of the advanced price demanded by the bakers, Catania reduced the price for the ordinary quality, first from 36 or 37 to 28 centimes per kilo, and then to 22 centimes, a rate of two cents a pound—ten centimes a kilo less than the current price in Naples for bread of the same quality.

The public immediately perceived an improvement in the quality of the bread furnished by the city. Now, after a struggle of eight months, the bakers have again reopened their bakeries, with the approval of the city, submitting to all the rules imposed upon them, and accepting the city's price-list. The general public looks on with a certain indignation at the course they have pursued. The working bakers of the municipal plant have agreed never to resume work in any of the bakeries now reopened or to be reopened, as they labor now under more equitable conditions and with less fatigue, and receive better wages. These have become enthusiastic supporters of the new movement. Catania has recently opened a large central modern bakery. Thirty-four ovens, with a capacity of 2,500 kilogrammes, were in use the first day, and this number is being increased as rapidly as possible. On the second day, forty ovens were in operation, and 70,000 kilos of bread were baked and sold. It is now intended to open branch bakeries in the various parts of the city and its suburbs.

A detailed statement has been issued for the benefit of those communities, large or small, like Naples or Nocera Inferiore, which contemplate following in Catania's footsteps. The books are open for investigation and confirmation of this statement. It is based on the experiences of the past eight months, excluding only the period of organization, during which citizens gave their services without pay. On a basis of a productive power of 600 quintals (or 60,000 kilos) a day, a net profit to the city is shown of about 138 liras a day, or, in round numbers, 50,000 liras a year. It is claimed that this profit is not due merely to the abolition of the dazio, because other places have been affected by the law abolishing it and there has been no consequent reduction in the price of the bread sold in those places, but whatever profit has arisen has accrued to the manufacturer. Catania claims that the profit of the municipal plant springs chiefly from reduced expenses consequent upon the centralization of production and modern equipment, from increased consumption, and from the direction of an energetic and capable business man. The production is now intrusted to about 500 laborers; the middlemen and the unskilful and incapable are excluded. These are divided into squads, which relieve each other at intervals, under only the necessary superintendence.

There are one or two items in this statement worth quoting. The men who mix and knead the bread are paid about four liras a day; 100 kilos of flour make 119 kilos of bread. Two mixers are employed to produce 600 quintals a day, at a cost of 1.3 centimes per 100 kilos. Two engineers are employed; one by day, whose daily wage is 2.40 liras, and one by night at 2.60—a dollar a day for both together. Supervision costs seven liras per day. There are also the items of heating the ovens, illumination and motor power, which diminish proportionately with increasing production. This expense, according to experts, amounts to 246.60 liras per day, or .411 per quintal. Rent costs 5,500 liras a year, or .025 per quintal, and the commission for selling, 5 per cent.

The three chief advantages alleged by Catania to have been secured by its experiment are that its inhabitants have never before been supplied with bread of so good a quality, never at so low a price; and this result has been effected not only without expense to the city, but with an actual profit at the rate of 50,000 liras a year. The bread now provided is made of unadulterated flour, and consequently is more nutritive and healthier, whereas that previously sold was too often made of dishonest mixtures of the poorest qualities of flour, even when nothing worse entered into its composition. Consequently, it is claimed as an advantage arising from this socialistic experiment that there ensues a greater freedom from disease among the laboring classes, fewer working days are lost, and less money needs to be spent for doctors and medicines.

The records of the office of the dazio prove that, before the city began to manufacture bread, 3,000 quintals a month of farinella were brought into Catania, and that none passes its limits now. Farinella is the term applied to the worst grades of flour—and in Italy twelve or thirteen qualities are distinguished—flour made from wheat that has spoiled in the field or grown damp and sour in storage. This Italian word, farinella, is synonymous with roguery. Statistics of the past ten years prove that, in spite of notable reductions in the price of flours and meals in different years, a high price for bread has been maintained in Catania until now. In fact, the price has always risen with the price of flour and remained at the same point with its fall. During the past months the price of bread has always remained below that of flour. The city claims that the benefits of its economical management, its centralized production, are felt exclusively by the consumers, who also enjoy the profit arising from the extension of the enterprise. The records of the office of the dazio prove also that the consumption of flour has increased one-fifth over previous periods. This may mean that the reduced price enables people to buy more bread, and this is credible in view of the well-established fact of the insufficient nutrition of the working classes in Italy. Or it may mean that when the city became the only consumer of flour, flour ceased to be smuggled into the city; to the profit of the local finances, and therefore the benefit of the general public. Both explanations may be true.

At a baker's in Ravello three qualities of flour were found in use—a good quality of wheat flour, and a very poor quality, and one resembling "Graham" flour. For the hotels a raised white bread is made and a

good quality of "Graham" bread. Then there is a bread made of a mixture of the Graham and the poorer quality of flour, which is sold at 24 centimes a kilo. This is also made into small narrow strips, baked hard, and sold stale under the name of "biscotti." This is in common use by the poorest in the place. Soaked in water, it becomes their staple diet. Another form of bread sold by this baker is called Pizza, and apparently is made of a very coarse cornmeal, mixed with water and a little salt, and baked in sheets in a hot oven. It is rather less palatable than our negroes' "hoe-cake," and is considered an unwholesome food in hot weather.

THE INTERNATIONAL HISTORICAL CONGRESS.

ROME, April 10, 1903.

The second International Congress of Historical Sciences closed yesterday after an eight days' session. The number of persons in attendance, and the number and quality of the papers presented, have far exceeded expectations. Nearly 2,500 members, of whom 300 were foreigners, have been enrolled, and 1,800 were present—so many that late comers, who had neglected to get their tickets before March 1, had to be excluded. The truly international character of the Congress is shown by the fact that it embraced representatives of eighteen different countries, including Japan, China, and India in the Far East, and Chile, Paraguay, Brazil, Peru, Uruguay, and Venezuela in South America. France sent the largest foreign delegation, as the French Government took pains to appoint one or more representatives of each university and professional school, including the Écoles de Droit and des Lettres at Algiers. The German delegation was, of course, strong in scholarship, but, except Harnack, it contained nobody of general reputation outside of his particular specialty. Indeed, no better illustration of the extent to which specializing has gone could be had than the fact that here were scores of men, each of whom was a recognized authority in his department, although he might not be known even by name to members of another department meeting in an adjoining hall.

The American delegation was unfortunately small. Those enrolled were Prof. H. E. Bourne (Western Reserve); Prof. E. C. Richardson (Princeton); W. R. Thayer (Harvard, American Historical Association, Massachusetts Historical Society); ex-Ambassador A. D. White; Worthington C. Ford and Herbert Putnam (Library of Congress); and E. B. Clapp, W. J. Carey, and Bernard Moses of the University of California. Prof. Spingarn of Columbia University, although not a delegate, was also enrolled. If the daily records of members registered can be trusted, Mr. Thayer was the only American delegate who took part in the proceedings.

The British Government did not appoint official representatives, but among the thirty British delegates present were several whose works are familiar wherever English is read. Most distinguished of them all was James Bryce, and, besides him, I may mention Frederic Harrison, Sir Frederick Pollock, Professor Mahaffy, Horatio F. Brown, the historian of Venice, Yorke Powell, Regius Professor of Modern History at Oxford, Sir Richard Jebb, D. B. Monro, and H. J. Pelham (Oxford), G. W. Prothero, president of the Royal Historical Society, Prof. Oscar Browning (Cambridge), James Mackinnon (St. Andrews), S. A. Murray (British Museum), and Sir Alfred Lyall, delegate from British India.

Among the 1,500 Italians were nearly all the eminent scholars of the peninsula. One regretted the absence, however, of Carducci, whom Italy unites in honoring as her foremost man of letters, and who may well be regarded as Europe's chief poet since Victor Hugo died. As ill-health kept him at home, the Congress telegraphed its greetings to him. Ettore Pais, the historian of Ancient Rome, and Cesare Lombroso were also absent; but with Comparetti, D'Ancona, Dalla Vedova, Tocco, De Cesare, —to mention only a few—Italian scholarship was finely represented.

A preliminary meeting for organizing was held on April 1 in the great hall of the Collegio Romano—the vast structure a dozen rooms of which were given up to the Congress. It chose Prof. Pasquale Villari President, and four vice-presidents, Adolf Harnack (Germany), Paul Meyer (France), James Bryce (England), and Basil Modestor (Russia). The next day it appeared that, by some unexplained process, Ludwig Pastor (Austria) had been added to the list of vice-presidents. This business was hardly over before one of the Berlin professors jumped up to announce that his august sovereign had sent the Congress a gift, and that some arrangement must be made to receive it "solemnly." A special time had already been set apart for receiving gifts, but that would not do for the Kaiser. Accordingly, the next day after the dedication of the *Forma Urbis*, a Prussian soldier appeared with some albums of photographs, and Rector Gierke "solemnly" presented them to an indifferent audience. Except to gratify Wilhelm's passion for notoriety, there was no more reason why he should thrust these pictures of German excavations on the Congress than why President Roosevelt should send a Rough Rider with a volume of views of the Great Serpent Mound in Ohio.

The formal opening of the Congress took place at the Capitol on April 2. The municipal hall, witness of many historical events, would not hold the concourse of *Congressisti*, besides the King and Queen, their escorts, and cabinet officials. Prince Prospero Colonna, Syndic of the city, spoke in behalf of Rome; Nasi, Minister of Public Instruction, followed with a brief survey of Italian scholarship; and then the President, Prof. Villari, delivered a memorable oration, in which he touched on the general advance in historical methods, on the solidarity of science, and on the problems which historians should help to solve. The nineteenth century, he said, established the principle of nationalities, and secured the economic and political enfranchisement of the laboring classes. The task of the twentieth century is to discover permanent relations, which shall be just, between the white and the colored races. The United States abolished negro slavery at the cost of a million lives, but the negro question is more insistent than ever; and the relations between white Europeans and Americans and the native swarms of Africa and Asia are bound to hinge at last on social rather than on political considerations. "Who knows," he asked, "how soon the United States and Russia, the two young giants of the modern world, may control the destiny of all the rest?"

After the exercises, the delegates followed the royal party to the palace of the Conservators, where was dedicated the *Forma Urbis*. This consists of 1059 fragments of a plan of the city of Rome at the time of Severus. The wall of a courtyard of the palace has been given up to the *Forma*, of which only a few of the fragments have been put in place, under the direction of Prof. Lanciani. Enough has been recovered to enable archæologists to reconstruct a complete map of Rome in the third century of the Christian era.

During the afternoon of April 2, several of the sections got to work, and it appeared at once that the term "historical" was used in a most comprehensive sense; for the Congress was divided into the following eight sections, several of which were further subdivided into groups: Section I., (a) Ancient history; (b) epigraphy; (c) classical philology; (d) comparative philology. Section II., (a) mediæval and modern history; (b) method; (c) archivistics, bibliography, and allied sciences. In this section, one session was devoted to diplomatics and another to Napoleonic history. Section III., history of literatures. Section IV., (a) archæology; (b) numismatics; (c) history of music and the drama; (d) history of art. Section V., history of law, history of economic and social sciences. Section VI., history of geography—historical geography. Section VII., history of philosophy and religions. Section VIII., history of the mathematical, physical, natural, and medical sciences. Each of the sections or subdivisions held three-hour sessions both morning and afternoon; the earlier session being usually devoted to the discussion of general topics, the later to the reading of papers.

To summarize the work of even one section would of course be impossible. The papers were of all descriptions, and their treatment differed very widely. One scholar discussed so highly specialized a matter as the worship of Mithras in Picenum, while another generalized on the problem of the philosophy of history. The judicious *Congressisti* went from one section to another, according as the interest of the topic or the distinction of the speaker attracted them. The stars of the Congress were Harnack, Sabatier, and Boni. Harnack outlined in less than an hour his well-known views on the genesis of the New Testament. Sabatier was to speak on Brother Elias, but, unfortunately, the Italians in his section fell to wrangling over the publication of a *Corpus Chartarum Italiæ*, and used up the morning; and as he had to leave Rome the next day, he could not give his lecture. Boni described the excavation of the Roman Forum, which he has superintended, in a lecture full of important matter for the archæologist and the historian, but hardly suited to the occasion. The distinguished architect is a dry writer, and so poor a lecturer that even those persons who sat near enough to hear him soon ceased to pay attention. Subsequently, at an evening lecture, he illustrated his subject with stereopticon views. Equally important was his report on the Roman materials found among the débris of the Campanile of St. Mark's. They include a collection, mostly inedited, of stamps of the

Roman brickkilns on the Adriatic from the first to the third century; of prints of human feet, horseshoes, hob-nailed boots; of various animals—goat, calf, and pig—and of a marsh bird. Comm. Boni also showed drawings of the structure of the Campanile, down to the lowest piles. I may add, in passing, that he found these foundations in perfect condition, so that the rebuilding of the Campanile can be begun at once, and will take only three years instead of eight or ten, as originally estimated.

One of the labors of the Congress which may bear direct fruit was the discussion of ways of collecting, editing, and publishing great masses of material, or of facilitating the investigations of scholars. Some of the resolutions passed by the various sections will show the drift of opinion. The section of mediæval and modern history hopes to see a thorough exploration of all the lands in the Levant and Adriatic which were once under the dominion of Venice, and it urges that a museum be established at Venice to preserve whatever objects may be collected. The numismatists recommend that henceforth collections of coins be arranged according to their geographico-topographic order, and that they be catalogued chronologically, instead of alphabetically. The section of music and the drama—in which Humperdinck and Dubois, director of the Paris Conservatoire, were conspicuous—would have the history of music illustrated by concrete selections, taught in musical institutions, so that the relation between music and the history and social conditions of each people shall be made clear. The geographers resolve that the Italian Geographical Society take steps to prepare a great historical atlas of Italy; and that it request the aid of scholars everywhere to compile a glossary of Italian territorial names at every epoch. The classical philologists vote that an edition of papyri containing Greek literary fragments—and especially of Homeric papyri—be made, letter by letter, after the norm of the Berlin publication. The modern historians call for a shortening of the time limit when state papers can be consulted; they suggest that documents down to the end of 1847 be now opened to inspection, and that to authors and professors of history still larger facilities be accorded. The historians of the fine arts recommend the issue of a Corpus of photo-mechanical facsimiles of the best Renaissance medals, and of a collection of facsimiles of Romanesque and Renaissance miniatures. In view of the bad condition of the plaster on which most of the Renaissance frescoes were painted, they recommend that plaster intended for paintings be prepared according to the rules laid down by Vitruvius in Book VII. of his 'Architecture.' The section of physical sciences wishes to undertake an edition of the complete works of Torricelli. The philosophers appeal to the Italian Government to publish a Corpus of the Renaissance Byzantine writers, and a series of the best monographs on Cesalpino, Cardano, etc. The bibliographers propose the compilation of an international historical bibliography.

A motion to proceed as soon as possible to the publication of a *Corpus Chartarum Italiæ* stirred up a hot debate, and was voted down as premature. A still livelier war raged over the attempt to secure the official approval of the Congress for the monumental edition of Muratori which has been edited by Professor Fiorini and is being published by Lapi at Città di Castello. President Villari opposed the resolution on the ground that it had been presented too late; moreover, he said, an international congress of this kind was not the proper place in which to decide a purely Italian question. This was an unexpectedly humorous turn to come from Signor Villari, who has a keen and comprehensive intellect, but no intentional humor; for nearly all of the resolutions passed by the other sections could as well have been ruled out as being "merely Italian." Some of the Germans reminded the President that they knew as much about Muratori and had as great an interest in him as the Italians themselves; but the resolution was lost, and in its stead a motion to "applaud" all editions and editors of Muratori was carried!

In so large a body of men, jealousies must naturally be looked for; but it was unfortunate that local or literary feuds were thrust upon the Congress. Few of us foreigners knew the animus behind them, and, even had we known, we should not have cared to take sides. In general, however, although the discussions often grew hot, they left no rancor; and much of the apparent heat might have been avoided if the sessions had been conducted according to Anglo-Saxon parliamentary rules. The Latin peoples show little respect for the presiding officer and none at all for the person speaking. They begin to hiss loudly for silence as soon as the meeting is called to order, and their hisses of course put an end to both silence and order. As soon as a speaker rises, they rush forward to be as near the tribune as possible, and there they stand, gesticulating, making loud comments, or hurling replies, till the next victim secures the floor. The spectacle of President Villari—a manikin in size, with pallid, ivory skin, white beard and hair, and an inexhaustible flow of language—bellowing and brandishing his fists at another distinguished Italian historian, who was trying to out-bellow and out-gesticulate him, was a surprise to many of the calmer Northerners, unaccustomed to such ways among scholars. But very possibly the disputants ate macaroni together in friendly calm as soon as the debate was adjourned. Certainly, a foreigner who judges hastily, where customs are so different from his own, runs the risk of misjudging.

The section of modern history devoted an afternoon to an especially interesting symposium on the teaching of history in secondary schools in various countries. Prof. Fredericq spoke for Belgium, Blok for Holland, Gertz for Denmark, Bresslau for Germany, Gabriel Monod for France, Altamira for Spain, W. R. Thayer (in the absence of Herbert Putnam) for the United States, James Bryce for England, and President Villari for Italy. As several of the speakers spoke on university, and not on secondary, instruction in history, no common ground for comparison was reached, but at no other session could one listen to such a picked body of speakers. Mr. Bryce was easily the most interesting, partly because, after a brief reference to the specified subject, he branched out into some general reflections on how history should be written. He said, at the outset, that there had been so little real teaching of history in the English universities that he hardly needed to speak of it. Within the memory of men now living, one of the universities had only one professor of history, who was expected to teach both natural history and human history combined! Mr. Bryce deplored the lack of seminars, laboratories, and other institutions, such as have long existed in Germany and the École des Chartes in Paris; but he added that, since 1894, the British universities have begun to wake up to the importance of a thorough training in history, and he hoped that, "in spite of our English conservatism," those universities would some time equal the best in this field elsewhere. Turning next to British historians, he said that, from Gibbon down to Green, they had all taught themselves history, since the universities offered no adequate instruction. Two qualities characterize their works: the literary quality and the human quality. They wrote histories to be read as literature; and they kept constantly in view the relation of the past to the present. Thanks to the sound classical training of the English universities, Englishmen have got their knowledge of Greek and Roman history at first hand, from the classics themselves, and so they have not divorced their historical writings from the *litteræ humaniores*. He closed with an urgent appeal that students and writers of history should cling to this higher ideal, and should resist to the utmost the encroachments of the physical sciences on the domain of culture, where history properly belongs.

Another important symposium was held in the section of international law on the evolution of comparative jurisprudence. Sir Frederick Pollock acted as chairman, and Frederic Harrison, Vinogradoff, Scialoja and others took part; but as your correspondent was prevented from attending it, he cannot report on it. Lack of space precludes more than passing mention of the announcement that the King has authorized Dr. Piumati to edit and print all the manuscripts of Leonardo da Vinci—news at which scholars the world over will rejoice. The reports of Prof. R. Orsi, of Syracuse, on the archæological explorations of the past fourteen years in Sicily and Magna Græcia, and of Professor Savignoni on the work achieved by the Italian mission in Crete, were among the most important contributions made to the Congress.

The Executive Committee, seconded by the municipal and national authorities, did all in their power to entertain the host of visitors. There were an illumination of the Colosseum and a concert at the Argentina Theatre, where the best choral societies of Rome sang specimens of sacred choral music from Palestrina to Rossini. Commissioner Nasi, Minister of Public Instruction, held a reception on the Palatine, where champagne flowed freely in the Palace of the Cæsars. The galleries of the Capitoline Museum and the Campidoglio itself were opened for an evening reception. The restoration of the ancient *rampa imperiale*, leading from the Forum to the Palatine, was dedicated. Count Gnoli, Librarian of the Biblioteca Vittorio Emanuele, exhibited an unparalleled collection of views, maps, and plans of Rome; the earliest dating from the fourth century. Prince Torlonia allowed the *Congressisti* to visit the Villa Albani, one of the sights of Rome which has become very rare; and there were

many other courtesies, which one would like to register in full. At the close of the Congress, many of its members went on an excursion to Norma and Sermoneta; but the tour of Sicily, which had been planned, was given up, as the necessary 300 persons did not enroll.

The last two days, the *Congressisti* suffered with the rest of Rome from a general sympathetic strike which called out the cabmen and 'busmen, stopped all but one newspaper, and alarmed the nervous. The Prime Minister, Zanardelli, and the Minister of the Interior, Giolitti, with solicitude which ought to close their political career, foreseeing trouble, disappeared the day before the general strike came on; the one to the outskirts of Brescia, the other to the confines of Piedmont. But, thanks to those officials who dared to stay at home and face the responsibility, there was no rioting, and on the third morning the general strike collapsed through the protests of the strikers themselves. Strangers naturally felt the inconvenience at the time; but as they look back they will not be sorry that this episode gave them the best proof of the common sense and orderliness of the great majority of the Roman people, and of the wholesome vigor of the new régime in Italy. One gets the impression that the young King is not only the most highly cultivated sovereign in Europe, but also a ruler of real ability, quiet but prevailing, judicious, just.

Before finally adjourning, a call, signed by representatives of the European countries and of the United States, was issued for the convocation of the next International Historical Congress at Berlin in 1906. No one who has taken an active part in a gathering of this kind can fail to recognize the benefits, immediate or far-reaching, which spring from it.

Correspondence.

A WORD OF USELESS PROTEST.

To the Editor of The Nation:

Sir: We call the heads of our colleges presidents, but it is a misnomer. We have no college presidents. They are dictators, with more or less democratic methods, as they choose. It must be so in the nature of our educational régime. They are elected over the college or university by a foreign board, and they alone have access to this board. They can make or mar the position of any member of the faculty; and with this consciousness in the minds of the members of the faculty, they dominate faculty meetings and the whole process of the government of the institution. This may be thought best from a business point of view, but are colleges and universities strictly for business, or for higher ideals of human development?

In all the land there remained one university with something of democratic initiative in its government. Its great founder wished it to be democratic—at least as democratic as the German prototypes. Under this management it became confessedly the greatest seat of learning for a large section of the country. This preëminence it still maintains. It has to-day a larger number of advanced academic students than any other institution of learning in the South. In spite of all criticisms, it has much the highest standard. I have taken some trouble to investigate, and I believe it to be true that the M. A. degree at the University of Virginia requires harder work than any degree of any kind given at any institution in this country. Yet, with such a record to its credit, the State Legislature, in obedience to the autocratic business spirit of the day, has determined that it shall have a "president."

The present writer is not a graduate of the University of Virginia, but he is a Virginian who has always taken pride in the high standard of his State University and in the independence and dignity of its faculty. That these objects of just pride will depart with the entrance of a "president" is inevitable. There may come more loudness, more newspaper mention, perhaps even more students; but, as Epictetus says, nothing is to be had for nothing.

Very respectfully, MEDIUS.

May 1, 1903.

BACON AND SHAKSPERE PARALLELS.

To the Editor of The Nation:

Sir: Apropos of your recent Note on *out-* verbs, the New English Dictionary furnishes some of the most interesting and valuable testimony that has yet been advanced in the controversy about the authorship of Shakspere. The most attractive of all the arguments for the Baconian authorship is that drawn from the "deadly parallel." If it can be shown that the phrase or the figure which occurs in the parallel quotations was in common use during Bacon's time and before, the parallelism is deprived of its value as an argument. The quotations of the New English Dictionary make it possible to determine the value of these parallelisms as arguments.

The following is a good example. A. P. Sinnet says, in the *National Review:* " 'Discourse of reason,' a phrase in 'Hamlet' that has been regarded as a misprint for 'discourse and reason,' is used several times by Bacon as it stands in the play, with the preposition 'of.' " This only shows that Mr. Sinnet and the commentators who did the regarding were not acquainted with an obsolete idiom of their mother tongue. If Mr. Sinnet had turned to the Dictionary, he would have found the phrase defined as "the process or faculty of reasoning," with quotations from 1413 and 1553. It was not a new or unusual phrase in Bacon's time.

Mr. Edwin Reed, in his 'Brief for the Plaintiff, Bacon vs. Shakespeare,' says:

"Perhaps the most interesting feature of the 'Promus' is the group of salutatory phrases it contains, such as *good-morning, good-day,* and *good-night,* which had not then come into use in England, but which occur four hundred and nineteen times in the Plays. These salutations, however, were common at that time in France, where Bacon, as attaché of the British Embassy, had spent three years in the early part of his life. To him we are doubtless indebted for these little amenities of speech."

In a footnote he adds: "One or two specimens have been found in earlier literature, but the statement in the text is substantially correct. These salutations did not take root in English speech till they were implanted there by the author of the Plays."

The editors of the Dictionary seem to have been entirely unaware of this interesting bit of literary history. The following quotations show that the English did not learn these salutations from Bacon:

c. 1386. Chaucer, Miller's Tale. "Hayl, maister Nicholay. Good morwe."

1430-1440. Lydgate, Bochas. "She rose her up. . . Without good day! or salutation."

c. 1460. Towneley Myst. "A good day, thou and thou."

c. 1420. Sir Amadas. " 'Gud devon, dame,' seyd he."

1481. Caxton, Reynard. "Noble lord and lady god gyue you good morow."

1575. Gammer Gurton. "God deuen, my friend Diccon."

1577. B. Googe, Heresbach's Husb. "God morowe maister Rigo."

Twenty-eight quotations containing these salutations are given with dates from the year 1205 to 1589. Mr. Reed's statement is not substantially correct, and what may be the most interesting feature of the 'Promus' cannot be considered a very valuable one.

The great mass of the parallelisms are of the following nature: From Shakspere: "As the mournful crocodile With sorrow snares relenting passengers" (2 Henry VI., iii., 2). From Bacon: "It is the wisdom of crocodiles, that they shed tears when they would devour" (Essay of Wisdom). Sir John Maundeville told the story of the weeping "Cokadrilles" in about 1400. Hawkins repeated it in 1565. It was a matter of frequent literary allusion. Spenser devoted a whole stanza of 'The Faery Queen' to this legend. Five other quotations of authors contemporary with Bacon are given in the Dictionary. It would only be consistent to say that Bacon wrote their works too.

Here is another parallel: From Shakspere: "If it be true that good wine needs no bush, 'tis true that a good play needs no epilogue" (As You Like It). From Bacon: "Good wine needs no bush" (Promus). The following quotation shows that this expression was not original with Bacon: "Where the wine is neat, there needeth no Iuie-bush," 1580 (Lyly, Euphues). In this case Bacon and Shakspere were only using one of the stock phrases of the day.

Some of the parallelisms can be explained without the aid of the Dictionary. From Shakspere: "Brother, you have a vice of mercy in you, Which better fits a lion than a man" (Troilus and Cressida). From Bacon: "For of lions it is a received belief that their fury ceaseth toward any thing that yieldeth and prostrateth itself" (Of Charity). Mr. Reed makes this comment in a footnote: "In this instance, as in many others, it requires Bacon's prose to explain Shakspere's poetry." The parallel is made worthless as an argument because Bacon says the matter in question is a "received belief" or a matter of general information. There is nothing strange in both authors making use of a received belief. Dyer, in his 'Folklore of Shakspere,' gives a number of allusions to this belief in English literature from that and earlier periods.

Of all the parallelisms between Bacon and Shakspere by far the greater part can be traced to an earlier source. The only logical result of the line of argument pursued by the advocates of Baconian authorship is that Bacon wrote all the literature of his own time. C. K.

JAYHAWKERS.

TO THE EDITOR OF THE NATION:

SIR: Apropos of the request of Albert Matthews for examples of the use of *Jayhawkers* before 1859, it may be of interest to refer to statements made by William Lewis Manly (recently deceased) in his thrilling book, 'Death Valley in '49.' For several years the present writer has enjoyed the personal acquaintance of this heroic pioneer, who by voice corroborated the printed statements. As shown by the subjoined extracts, *Jayhawkers* is the name applied to a party of young emigrants to California, who, in the winter of 1849-50, experienced the horrors of Death Valley, and several of whom thereby lost their lives. Prominent among the party were Ed Doty, Tom Shannon, and L. D. Stevens (see p. 160); while among those that perished were Messrs. Fish and Isham (p. 162). In the book referred to, the word *Jayhawkers* is used scores of times. While Manly himself was not of the original party, his own party repeatedly crossed the track of the *Jayhawkers* in '49, and for parts of the way they travelled together.

On pp. 364-365, Manly gives what appears to be a virtually complete list of the names of the party. An account of the Death Valley Party of 1849, by the Rev. J. W. Brier, a survivor, is concluded in *Out West* for April, 1903.

ROCKWELL D. HUNT.

HIGH SCHOOL, SAN JOSÉ, CALIFORNIA,
April 22, 1903.

"The little train afterward known by this name was made up in the State of Illinois in 1849, of industrious, enterprising young men who were eager to see and explore the new country then promising gold to those who sought. The young men were from Knoxville, Galesburg, and other towns" (p. 320). "These Illinois boys were young and full of mirth and fun, which was continually overflowing. . . . One of the boys was Ed Doty, who was a sort of model traveller in this line. . . . One day when Doty was engaged in the duty of cooking flap-jacks, another frolicsome fellow came up and took off the cook's hat and commenced going through the motions of a barber, giving his customer a vigorous shampoo, saying: '*I am going to make a Jayhawker out of you, old boy.*' Now it happened at the election for captain in this division that Ed Doty was chosen captain, and no sooner was the choice declared than the boys took the newly elected captain on their shoulders and carried him around the camp, introducing him as *the King Bird of the Jayhawkers.* So their division was afterwards known as The Jayhawkers, but whether the word originated with them, and John Brown forgot to give them credit, or whether it was some old frontier word used in sport on the occasion, is more than I will undertake to say; however, the boys felt proud of their title, and the organization has been kept up to this day by the survivors" (pp. 321-322). "Some years afterward the members of this party who had returned to their Eastern homes formed themselves into an organization which they called the Jayhawkers' Union, appointed a chairman and secretary, and each year every one whose name and residence could be obtained was notified to be present at some designated place on the fourth day of February, which was the date on which they considered they passed from impending death into a richly promising life" (pp. 363-364).

BLIZZARD.

TO THE EDITOR OF THE NATION:

SIR: I don't know that I can give an answer, in the form he desires, to Mr. Matthews's question of April 9, with regard to the use of the term "blizzard" prior to 1880, but my first practical experience of the real thing was from November 12 to 15 of 1872, when, on my return from the discovery of the great diamond fraud of that year, I had stopped off at Cheyenne, Wyoming, to visit a cattle ranch—then a new experiment—in which I had a slight pecuniary interest. The so-called ranch consisted of a small cabin on the open plains about nine miles south of Cheyenne. During the three days I was forced to spend there, our time was mainly occupied in gathering fuel to keep ourselves from freezing. The force of the wind was such that we could not venture away from the shelter of the cabin, and it was considered madness to attempt to return to town. The thermometer, as I afterwards learned, ranged at about 20 degrees below zero.

I have no files of the New York *Herald* at hand to refer to, but my impression is that, upon obtaining copies of that paper, we found accounts of this terrific storm, which was far fiercer than anything I had experienced during six years' previous campaigning in the Western mountains, and which it had called a "blizzard," a name which struck me at the time as new and as singularly expressive.—Yours truly,

S. F. EMMONS.

1721 H STREET, WASHINGTON, D. C.,
April 30, 1903.

TO THE EDITOR OF THE NATION:

SIR: I am indebted to Dr. Green for his example of this word in yesterday's *Nation.* In regard to "the ship *Blizard,*" mentioned in a Boston newspaper of 1765, Dr. Green remarks: "From the fact that it was applied to a ship, I infer that the word originated among sailors." May I be allowed to suggest that this inference is not a necessary one, and that perhaps the vessel was called after some person (possibly its owner) named Blizard? As early as March, 1656-7, a Humfrey Blizard matriculated at Merton College, Oxford; in the eighteenth century the name is found both in England and in the West Indies; and now the surname is not uncommon in this country. It appears in the forms Blisard, Blissard, Blizard, and Blizzard. There is at present, so far as I am aware, no evidence to connect the word *blizzard* with the proper name.

ALBERT MATTHEWS.

BOSTON, May 1, 1903.

MONT PELÉ.

TO THE EDITOR OF THE NATION:

SIR: Americans and English seem always to write "Mont Pelée." It is not a capital error, to be sure, but is still annoying to those accustomed to the invariable French practice, "Mont Pelé." The longer feminine form is naturally written "Montagne Pelée." Yours truly,

F. R. W.

PARIS, April 23, 1903.

[The solecism is of long standing in our best encyclopædias. It finds a parallel in "Morne Pelée" (an alternative designation), which occurs in C. W. Eves's 'West Indies' (4th ed., 1897).—ED. NATION.]

Notes.

'Evenings in Little Russia,' translated from Gogol by Edna W. Underwood and William H. Cline, will soon be issued by William S. Lord, Evanston, Ill.

Doubleday, Page & Co. announce that the new volume of Kipling's Poems will bear the title of 'The Five Nations.' Twenty-five of them have never before been printed.

In the poetic line, G. P. Putnam's Sons are about to bring out 'Echoes from Erin,' by William Westcott Fink; 'Notes from Nature's Lyre,' by Howard Beck Reed; 'Puerto Rican and Other Impressions,' by William James; besides 'Florida Fancies,' by Frederick R. Swift, a tale of fishing and hunting expeditions remote from the beaten track.

'Shakspere and the Rival Poet,' namely, George Chapman, is the title of a work, by Arthur Acheson, of Chicago, announced by John Lane. Internal evidence as to this rivalry is sought to be adduced from the Sonnets.

From the office of the *Publishers' Weekly* has appeared the 'Annual Literary Index' for 1902—the annual 'Poole,' in other words, plus the Index to General Literature (that is, to the contents of certain books, as contrasted with periodicals), plus an author-index to *both* sections, plus a list of the bibliographies of the year, a necrology, and an index to dates of principal events. The varied usefulness of this thin volume needs no further exhibition. Another issue from the same source is the 'Annual American Catalogue Cumulated, 1900-1902,' a triennial combination, prefaced by statistics of book production for the past year, the report of the Register of Copyrights for 1901-1902, and a directory of American publishers who put forth books in the period here recorded. This is the second stage of the cumulative experiment begun last year.

The 'Year Book of the Pennsylvania Society' of this city for 1903 maintains the interesting character of the series, at least on the antiquarian and pictorial side. Noticeable is the summary sketch of the Governors of the State derived from the fourth series of the Pennsylvania Archives, and illustrated with autographic facsimiles. The literature especially related to Pennsylvania is well looked after. The speeches at the fourth annual dinner are the meagrest part of the feast. Nowhere is there an intimation of the political degradation of Pennsylvania through the corruption of both parties. Mr. Baer, the vigorous President of the Reading, could not fail to revert to the recent coal strike, and to charge the State with failure to protect her citizens "in the simplest and smallest of all natural rights for the protection of which government is founded—the right to work." But even he did not connect that failure with the very fountain of corruption at Harrisburg and in the United States Senate. The chaplain, Dr. Batten, did better, for, Philippinewise, he prayed that the Constitution might follow the flag, and, domestically, asked: "If we really love America, shall we permit its citizens to be governed by thieves?"

The late Hepworth Dixon's 'History of William Penn' has been reprinted by the

New Amsterdam Book Company in a neat volume with a portrait.

The dainty little "Lovers' Library" of John Lane once more departs from its original intention of including only classic English verse of the tender passion, to take in Miss Jane Minot Sedgwick's 'Love Songs from the Greek'; and these are accordingly printed in green ink suitable for a green thought in a green shade.

"Love's Labour's Lost" is the second of the commendable series of reprints of the First Folio undertaken by Charlotte Porter and Helen A. Clarke (T. Y. Crowell & Co.). We observe that the editors' preface is repeated, as is well in view of separate sale; but the introduction is pertinent to the play. The notes, variorum readings, and selected criticisms more than half fill the handy volume.

More elegant, in fact unusually handsome, are the "Othello" in the Dowden Shakspere of Bowen-Merrill Co., Cleveland, of which the editing has been intrusted to H. C. Hart, and the "Cymbeline," which Professor Dowden has taken for his province. The various readings and the notes are on the same page with the text, in a very lucid and harmonious proportion.

Mr. H. W. Boynton's task in continuing the "Cambridge Edition" of poets which used to be Mr. Scudder's especial charge, in the case of the Complete Poetical Works of Alexander Pope (Houghton, Mifflin & Co.) has been for the first time to include all within the limits of a single volume, and to observe an approximate chronological ordering. He has also discarded all but Pope's twelve books of the Odyssey, and has taken a proper liberty with the notes, which are relegated to the end, with a glossary of names of Pope's contemporaries mentioned in the poems. There is the usual biographic-critical introduction. Add a portrait and a title-page vignette showing Twickenham villa. The volume of nearly 700 pages is not bulky, and its inclusiveness leads us to remark that there exists a Concordance to Pope—namely, Edwin Abbott's, published in 1875 by Messrs. Appleton.

We have received from the Research Publication Society, No. 14 Beacon Street, Boston, Part I. of 'The Higginsons in England and America,' by Eben Putnam.

It is unfortunate that few teachers of history in our country have had even a little training for work in the ancient field. Mr. West, in his 'Ancient History' (Allyn & Bacon), betrays this lack of preparation by constant misinterpretation of sources as well as by his misstatement of facts which should be known to every schoolboy. Characteristic of the author are the assertions (on p. 157) that Herodotus wrote his history "after the fall of Athens, when it was unpopular to praise her," and that, in the battle of Mycale, "the Greeks first destroyed a great Persian land army, and then, reembarking, they seized and burned the three hundred Persian ships." In considerable parts, however, he has attained accuracy by a culpable sacrifice of independence. Noteworthy, too, are the tendency to disproportion, which sacrifices important periods to the unimportant; the elimination of the personal element from the Roman imperial era, which makes his treatment difficult as well as dry; and finally the ready adoption of new theories, however erratic—for instance, that of Ridgeway. Wolfson's 'Essentials in Ancient History' (The American Book Co.) has most of West's faults highly magnified, and in addition a vicious style.

The *Consular Reports* for April opens with an interesting illustrated account, by Consul E. H. Thompson of Progreso, of the cultivation and preparation, for the market, of sisal, the Yucatan fibre. It is generally known in commerce as sisal grass or hemp, but the fact is "that it is neither a grass nor a fibre, and is not produced to any great extent in Sisal. The name 'sisal' was applied to it because it originally reached the outer world through the port of that name." Other subjects treated are the copper, silver, and gold mines in Latin America, and the North Sea fisheries, with notice of Professor McIntosh's tabulation of the catches made during a series of years by a vessel properly fitted out for the purpose, as published in his 'Resources of the Sea.' He is convinced from them that the fears of an ultimate extinction, or even a perceptible diminution, of the fish supply are entirely baseless.

The development of the East Africa Protectorate through colonization and irrigation is discussed in the *Geographical Journal* for April by Mr. R. B. Buckley, a leading irrigation expert of India. The population at present averages only about ten to twelve persons per square mile, and the most temperate and healthy parts are practically uninhabited. These could be colonized by Europeans, while the surplus population of India might be induced to occupy the lowlands. It is not a country for grand irrigation projects, but small storage works could be scattered along the streams. The Government is advised to institute a model agricultural farm, with some irrigation works to serve as a model and guide to settlers. Dr. W. G. Smith and Mr. C. E. Moss give the results, with a map and illustrations, of a survey of vegetation in Yorkshire to solve the question, "How are the species arranged with regard to one another, and with regard to soil and climate?" A young American traveller, Mr. A. Hamilton Rice, tells of a journey made by him in 1901 from Quito to the Amazon by the River Napo. The greater part, apparently, was through a dreary country, inhabited by people with whom "the regular thing in the Sabbath afternoons is to get as drunk as possible." When the Peruvian border was crossed, "a strangely incongruous sight is to see an almost nude Indian woman using a sewing-machine, making calico dresses for her children, yet it is not an uncommon event. Even among those Indians who eat squatting on the floor, with fingers for forks, knives, and spoons, the sole article of household furniture may be a Pan-American or a New Haven sewing-machine, in which the female members take the greatest pride."

Petermann's Mitteilungen, No. 2, contains an interesting account of the Brazilian rubber industry. The best product comes from the *Siphonia*, and the sap is collected, from May to October, by tapping the trees every other day. The holes made in the bark close in two hours. An orchard consists on the average of 200 trees, from which the owner may get from 1,000 to 2,000 pounds a year of gum, selling for a little over $2 a pound in Europe. The kind known there as caoutchouc is obtained only by felling the trees, and is consequently disappearing, while the *Para-fina* is increasing through cultivation. The gum obtained from the cultivated trees, however, is not so good as that from the wild tree. Other articles are upon the geographical changes of the North German coast since the glacial period, and upon Upper Burma and the Shan States.

The unanimous vote of the Swedish Riksdag to grant 75,000 kroner to Dr. Sven Hedin, to enable him to publish in *English* the scientific results of his last great journey in Central Asia, is a remarkable evidence of disinterested enthusiasm for the advancement of general knowledge. One volume and a large atlas will contain Dr. Hedin's report on the geography of the 6,500 miles of country which he traversed and mapped on 1,149 sheets, having fixed the position of 113 points by astronomical observations. To these and the meteorological observations other volumes will be devoted, as well as to the geological, botanical, and zoölogical collections, and the Chinese manuscripts and inscriptions. The volume dealing with the manuscripts will be prepared by Dr. Himly of Wiesbaden, the well-known sinologist; the others will be edited by Swedish experts.

It has been generally known that paper was originally an invention of the Chinese, and was first brought to Europe by the Crusaders, finding its way to Germany as early as 1190. It has now been the good fortune of Sven Hedin to furnish the ocular proof of this historic fact. He found, on his recent journeys, Chinese paper that dates back to the second half of the third century after Christ. This lay buried in the sand of the Gobi desert, near the former northern shore of the Lop Nor sea, where, in the ruins of a city and in the remnants of one of the oldest houses, he discovered a goodly lot of manuscripts, many of paper, covered with Chinese script, preserved for some 1,650 years. The date is Dr. Himly's conclusion. According to Chinese sources, paper was manufactured as early as the second millennium before the Christian era. The character of the Gobi desert find makes it probable that the making of paper out of vegetable fibres was already an old art in the third Christian century.

Volume XXX., Part iii. (pp. 209 + xl), of the Transactions of the Asiatic Society of Japan, contains a "History of the Rise of Political Parties in Japan," by Mr. A. H. Lay, which brings the story down to the end of 1902. It is a masterly résumé of political development from the epochal "charter oath" of the Mikado in Kioto, in 1868, showing how, in spite of rebellions at home and wars abroad, "the intensely democratic nature of the Japanese people" asserted itself. The final goal of the ambition of the various parties—all being of reform, none of reaction—cannot be far off, and that is the control of the administration, with full budgetary power. Loyalty to the Emperor has never been lost sight of. Mr. Lay's conclusion is that as the parties have rid themselves of their unruly and dangerous elements, and learned the lessons of responsibility, they have more and more gained the public confidence. In a word, the nation has in one generation been transformed from feudalism to modern life. Most valuable to the student of modern Japanese literature are the hundred pages or more devoted to a classified list of recently published Japan-

ese books, with name, author, publisher, price, and title in English, Romanized Japanese, and Chinese characters. With all their avidity for science, the Japanese in their imaginative and historical writing draw from their own national story. Rev. Arthur Lloyd, librarian, 56 Tsukiji, Tokio, will be glad to act as intermediary for the purchase of translations of any of these native works. A list of the principal publishers in Japan, minutes of meetings, etc., conclude the highly creditable series of thirty volumes.

The centennial celebration of the University of Heidelberg, to be held during the coming summer in honor of its revival by Carl Friedrich of Baden, in 1803, will naturally not be on so extensive a scale as was the semi-millennium celebration in 1886, but will, nevertheless, be a notable event, to which all the other German universities and technological institutes have been invited. Among other things, an imposing memorial building is being erected, and the Grand Duke, as the Rector Magnificentissimus, has promised to take a prominent part in the celebration, which will not be made an international event.

The list of the British Commission for the St. Louis Exposition was announced in London on April 24. Among the Commissioners figures the name of Mr. Edwin A. Abbey, R. A., and his inclusion on a British Commission becomes a matter of serious consideration for American artists. By accepting such a position Mr. Abbey either renounces his American citizenship and all claims to show as an American artist in the St. Louis Exposition, or he is endeavoring to become a citizen of two countries at the same time—an impossibility both nationally and artistically. The fact that an American artist resides abroad for many years for the purpose of pursuing his profession should in no way affect his position and rights as an American citizen and artist; and he should, of course, be at liberty to join any foreign art society. But the line should be drawn, and drawn sharply, when he throws in his lot with a foreign country by accepting an official position from its Government. Sir Lawrence Alma-Tadema, who was in very much the same predicament, settled the question many years ago, and has always identified himself with the country to whose Royal Academy he belongs.

—The announcement that the International Society of Sculptors, Painters, and Gravers in London has leased the New Gallery, Regent Street, for the winter seasons of 1904, 1905, and 1906, is of special interest in more than one way to American artists. In the first place, the Society, which deserves its name of International, has for President an American artist, one of the most distinguished, Mr. Whistler; while other Americans figure prominently on the Council, among the Associates, and as honorary members, including Alexander, Chase, MacMonnies, Melchers, Pennell, St.-Gaudens, Shannon, Humphreys-Johnston, and Morrice. In the second place, the Society has become the most important exhibiting body in London for the foreigner. Though three or four Americans have been elected to the Academy, it is well known that almost all other American artists, and indeed all foreigners, have little chance of being treated with civility in the Academy's exhibitions, even if their work should by mistake be accepted. Up to the present, the foreigner has not been encouraged to show in London except at the dealers' galleries. But the International depends largely on foreigners, and, moreover, it has the grace to be as generous in its treatment of outsiders as of its own members. What the Council aims at is to show good work, wherever it may be found. This is a fact that should be noted to its credit, especially now when the tendency of societies of artists in London is to lessen, rather than to extend, the privileges of outsiders. Even the New English Art Club, supposed to be more liberal than the average, is increasing its restrictions. The first two exhibitions of the International were held at Knightsbridge, the third at the Institute. Now in the New Gallery the Society has secured by far the best exhibiting rooms in the very heart of London. Part of its work has been the organization of the British section in international exhibitions abroad, with very notable results at Carlsruhe, Budapest, and Dresden. It would be interesting if it could show in its full strength some day in America, when, probably, American artists would see still more reason for giving it their support.

—One looks naturally for special consideration of Emerson in the magazines of the centenary month. In the *Atlantic* he is studied by the Rev. George A. Gordon, as a religious influence. The article will provoke dissent in its attempt at a too rigid limitation of this influence. Hamilton W. Mabie, in *Harper's*, says that Emerson, more distinctly than any other American, "affirmed the presence of the divine in every human being, the direct and personal relation between each man and the infinite, the authority of individual insight, the dignity of the individual soul." This sentence indicates the dominant tone of Mr. Mabie's discriminating article on "Emerson in 1903." In the *Century*, Emerson is treated editorially, and along with due recognition of his spiritual message one finds dissent from the tendency to undue depreciation of his literary art. The lack of constructive continuity is of course too evident for denial, but on the other side of the balance-sheet we have "the cosmic character of the separate sections," the melodious cadences that go along with the occasional roughness of his verse, "charming the mind and ear with an unearthly music," the keen vibration of sentence or phrase, "creating in the mind a sense of luminousness," each thought standing out as the natural product of a soul apart, a life unique, with "no pettiness to deplore, no derelictions to explain or forget." Aside from Emerson, the most striking points of strictly literary interest for the month are the continuation of Mr. Trowbridge's papers in the *Atlantic* and the editorial departments in *Harper's*. Mr. Trowbridge deals almost exclusively with Holmes and Longfellow, with both of whom he was thrown into very intimate relations. Like Higginson in his recent biography, he deprecates the present tendency to underrate Longfellow's poetic achievement. Aside from his more important productions, "is it not pertinent to inquire what writers of to-day, on either side of the sea, are blending thought and feeling in such forms of beauty as the 'Two Angels,' 'The Bridge' 'The Arsenal at Springfield,' 'The Birds of Killingworth,' and a long list beside of poems as full of a wise, sweet humanity and as perfect in their art?" In the "Editor's Easy Chair" Mr. Howells discourses wittily and satirically as to what might be done with an ample financial endowment for his department, suggesting among other things a museum of literary properties for the benefit of would-be popular novelists, schemes for boiling down poetry to its real poetic content (with equitable compensation to the writers for the financial sacrifice), prizes for a system of compensation to authors on the basis of quality rather than quantity, etc. "The real Editor," as Mr. Howells calls him, contributes a page to the discussion of poetic form, setting aside the acoustic theory of Poe and Lanier as too narrow to include the most essential element of poetic rhythm. We do not find here, and perhaps it would be too much to expect, any very clear definition of this essential element without which mere acoustic perfection is in vain; but we are instructed to seek for it in a winged and vibrant thought, having the sort of meaning that prompts rhythm—thought that seizes upon and uses the acoustic element, not that is used by it.

—The Navy Department is treated by Capt. Mahan in *Scribner's* series of papers on "The Government of the United States." As might be expected, that side of the Department's work which has to do with the creation and enlargement of naval resources is put strongly in advance of the more humdrum duty of routine administration. For the purpose of developing a more definite and consecutive naval policy, Capt. Mahan would have a permanent board, purely advisory in its functions, to give constant consideration to specific needs and to problems of naval evolution in general. He does not hesitate to speak of war as "the end for which the navy exists"—a bit of frankness which many men of his own fundamental views would do well to emulate. The initial paper of Gen. Gordon's reminiscences of the civil war, in the same magazine, may be mentioned here because of the paragraphs in which he seeks to define the proper attitude of men of the present day towards that struggle. He admits that negro slavery was the cause of the war—"had there been no slavery, there would have been no war"—and, as well, that the abolition of slavery was a blessing to the South. The one side did not go into the struggle from the simple motive of its retention, nor the other from that of its abolition. The germs of the struggle were in process of development before the Union was formed, and were incorporated in the Constitution itself. Each party had ample ground in law and precedent to feel that it had legitimate and praiseworthy principles to fight for, and hence neither side should claim that it was "wholly and eternally right," nor expect the other to admit that it was "wholly and eternally wrong." Alfred Holt Stone, in the *Atlantic*, seeks to simplify the race problem by getting people to recognize in the negro not a mere lack of race development, but a permanent and radical race inferiority. The so-called achievements of the race, he holds, are achievements of mulattoes, not negroes, and due entirely to the white blood in the mulatto. This is an old fallacy, contradicted by the experience of all teachers and observers of freedmen since the war. If the tone of this paper

fairly represents the attitude of mind of the entire Committee of the American Economic Association, appointed to investigate the condition of the American negro, a Committee to which Mr. Holt belongs, it is safe to predict that the solution of the problem has little to expect, at least in any direct way, from the action of the Committee. Mrs. John Van Vorst, in *Harper's*, brings a severe indictment against the large class of "factory girls" who work for wages, not from any real necessity, but from a desire for fine clothes, personal independence, etc. This type of worker is a rival of man to her own detriment, she thinks, and of woman to the detriment of her sex. Mrs. Van Vorst bases her article upon actual service, incognito, in the ranks of those of whom she writes. In "The Hampered Executive" Henry Loomis Nelson contributes to the *Century* a corollary to his previous paper on "The Overshadowing Senate."

—The *American Journal of Insanity* for October, 1902, contains a thoughtful article by Dr. Walter Channing, since reprinted, upon "The Mental Status of Czolgosz," President McKinley's assassin. Careful consideration of the murderer's history not developed at the trial, including his recent association with anarchists, of which only one phase was brought out by the prosecution and there was no defence, leads the author to the conclusion that this man was the victim of a delusion (in the technical sense), and therefore was insane. He dates progressive deterioration from an illness in 1898, which compelled Czolgosz to abandon regular work in a wire mill, with which he had been steadily occupied for seven years. While thus working, he had an unusually good reputation for industry and cheerfulness, and had been elected into a patriotic society, whose members were particular as to their associates. Unfortunately, it does not appear what was the nature of that illness, nor does Dr. Channing seem to connect the critical retrogression as even indirectly dependent upon a peculiar bashfulness in youth, so extreme as to suggest a want of equilibrium even then. It would look as though his original nervous equipment was insufficient to withstand the strain of the subsequent ill health. There are fair grounds for concurring in the conclusion that a serious delusion led to the tragedy; that in fact the man was insane, and that his dealings with anarchists had no causal relation to the crime. This recognition of delusional insanity by no means implies entire irresponsibility. In our own opinion this case was not one of irresistible impulse. There was a clear knowledge of an offence against society, and of possible escape from the penalty. Czolgosz told the Chief of Police that "he knew people sometimes escaped being hanged, and he might." There are other illustrations of his knowledge of the legitimate atonement and of the law's uncertainties. It would have been perfectly possible for him to refrain. Responsibility is not always lost when abnormal conceptions arise. An insane man having this margin of judgment may justly be condemned, for it is better to extinguish such a life and thus deter others who are on the same borderland, than, by clemency to the individual which is not mercy to the community, tempt other mental stragglers into similar paths. The alienist may determine where aberration begins; the courts should decide where responsibility ceases.

—'Days and Deeds,' by Mr. E. W. Howson (Rivingtons), is a calendar of anniversaries, with short, explanatory notes which are chiefly bibliographical. In its general arrangement and appearance this little volume recalls the familiar birthday book, and the sense of resemblance is not lessened when we examine the contents. Birthdays and deathdays bristle on every page, and seem to occupy more space than is devoted to political and military events. Battles, however, figure largely, and a few of the main stages in the progress of science are registered. The entries under each day vary in number from one to twelve, and seem to average about five. Mr. Howson, the editor, is a former fellow of King's College, Cambridge, and at present a master in Harrow School. That he has received some systematic training in history is evident from the character of the events which he has selected for notice. At the same time his entries are somewhat capricious, and he might have made better use of his space. In other words, he has included a good many names and events of third-rate importance while omitting those which belong to the first and second rank. Such a procedure may perhaps be justified on the ground that diversity is desirable, but it is hard to see why Dibdin and Bishop Andrewes should be included in a book in which exclusion of all save the most important is the main condition of success. Mr. Howson has apparently chosen to take what is representative rather than what is of the highest intrinsic consequence. He says: "I have endeavored to make this calendar as catholic as possible, and to include not merely biographical dates, but Church festivals and Councils, political events, legislative acts, the institution of orders and societies, battles, treaties, geographical and astronomical discoveries." Mr. Howson may be said to have attained the accuracy which should belong to timetables and date-books. Some of his citations from Greek and Roman history rest on questionable authority, but otherwise his entries are not open to serious reproach. One should be careful about speaking of Cabot's discovery of Newfoundland; the French Revolution had broken out before the storming of the Bastille; and the Holy Roman Empire came to an end in 1806, not 1804. These are minutiæ; on the whole, we have been favorably impressed by the editor's carefulness and the accuracy of the proof-reader.

—Iphigenia among the Taurians has become so associated in the popular mind with Gluck and Goethe that the original Euripides has been too much taken for granted. Yet the "Tauric Iphigenia," the last extant Greek play that deals with the tragic fortunes of the royal house of Mycenæ, is no less beautiful than the "Alcestis," and is as moving, in its way, as the "Medea." That it appeals to a modern audience was proved by the two performances given last week by the undergraduates of the University of Pennsylvania in the Philadelphia Academy of Music. The setting of the "Iphigenia" was simple—the regular background of polychromatic temple, with a single central door; the only special features being the skulls of the victims of Artemis and her bloodstained altar at the side, instead of the altar of Dionysus. There was no narrow raised stage as in the Harvard performance of the "Œdipus" in the eighties, but actors and chorus were on the same level, in accordance with the views of Dörpfeld. One does not look for antiquarian accuracy in a performance that must take account of modern æsthetics, so that no one need regret the absence of the tragic mask and cothurnus or cavil at the modern orchestra. Dr. Clarke's specially written music was admirably austere, and the evolutions of the chorus of Greek maidens, whose feminine get-up was most convincing, took account of strophe and antistrophe, and were charming as a whole. But for the most part they danced in silence, while their songs were sung by the members of a Philadelphia choral society, who sat with the audience, separated by the orchestra from the dancers. These singers would have been far more effective concealed in the wings, as was occasionally the practice on the Athenian stage. Even this criticism seems ungracious where the rest was so admirably managed. The enunciation of the Greek and the sense of the rhythm, points all-important to an Athenian audience, left little to be desired. The difficult monodies were well rendered by Orestes and Iphigenia, and the trochaic tetrameters sung by Iphigenia and Thoas were very effective. Such a performance involved an enormous amount of patience and hard work on the part of the actors, to say nothing of Dr. Lamberton and Dr. Clarke, who were responsible for the production. The Greek residents of Philadelphia showed their enthusiasm by their attendance, and by floral offerings which were displayed each night after the play.

MATHIESON'S POLITICS AND RELIGION.

Politics and Religion. A Study in Scottish History from the Reformation to the Revolution. By William Law Mathieson. 2 vols. Pp. 412, 387. New York: The Macmillan Co. 1902.

This book is written from an interesting standpoint, and its author occupies a somewhat unusual position among historians who have described the course of the Scottish Reformation. Mr. Mathieson has a predilection for the *via media*. John Knox and the Covenanters are not his heroes, nor is he willing to allow that fierceness of dogmatic conviction can atone for the lack of Christian charity. In his eyes the cause of Protestantism was best served by the friends of mildness and toleration. Turning his back on the zealots, he takes up the cause of the bishops. The very men whom Gardiner describes as "drifting helplessly like logs on the current of affairs" were, he believes, the possessors of the true light, and their tradition has prevailed. On the surface the Scottish church seems to be Presbyterian, but Mr. Mathieson maintains that its true liberalism is not traceable to a Presbyterian source. "Whilst professedly Presbyterian," he says, "the church has fallen into line with that great moderate tradition—the tradition of light and reason, of 'peace and concord, kindness and goodwill,'—which Episcopacy of the true Scottish type, from Cowper and Patrick Forbes

to Leighton and Charteris, had endeavored to uphold."

We have read Mr. Mathieson's volumes with great enjoyment, for his liberalism is both generous and reasonable in tone. When, however, we approach the task of criticism, we find it difficult to decide whether we should lay more stress upon the positive or negative aspects of the work; upon its praise of the moderates or its condemnation of the zealots. Perhaps we shall begin best if we say that beneath the title 'Politics and Religion' there lurks the more celebrated phrase, "Church and State." The rise of theocracy, the rule of the ministers, and the decay of Puritan fanaticism were processes which involved the clergy and the Government in closest contact. The point of departure is Knox's religious egotism. As Mr. Mathieson puts it: "The chief characteristic of the Knoxian school was its determination, fixed as the stars, to make its own interpretation of the divine law prevail over every secular and over every competing religious interest." In these words is disclosed a source of ecclesiastical and political antagonism which does not run dry until the close of the seventeenth century.

Mr. Mathieson has a great affection for those who loved Scotland better than their own particular shibboleths, and among the earliest of his favorites we must name Maitland of Lethington. This brilliant personage, who possessed all the gifts and tastes of an Italian, found his lot cast by fate among the barbarian chiefs of Edinburgh, yet none the less did he play his part in earnest. Mr. Mathieson does not pretend that his political morals were perfect or that he declined to use the methods of a conspirator. In singling Maitland out from the rest of his contemporaries and giving him precedence over other politicians of the early Reformation, Mr. Mathieson credits him with a sincere idealism. According to this view his "matchless skill in diplomacy" availed him nothing, because the breadth and enlightenment of his projects made successful statesmanship impossible in such an age. He was too advanced for Scotland, and "the cold shadow of Puritanism was already creeping over the land."

No one who feels deep sympathy for the aims of Maitland can find a place in his heart for the aspirations of Knox. The two men opposed, disliked, distrusted each other, and the opposing tendencies which they represented were not to disappear in a single lifetime. Beyond all question Knox had two great virtues, zeal and honesty. Mr. Mathieson refrains from denying him these, but for the rest the deficiencies of the Reformer are made more prominent than his triumphs. By force of character he created a church, but he was totally lacking in breadth of view. Though he vindicated the moral law, he turned a deaf ear to the Christian message of love. Knox was an exponent of the Old Testament, while the Moderates took their stand upon the Gospels.

Such, in part, were the traits of Knox, but Mr. Mathieson, rising from the particular to the general and speaking more philosophically, declares that destiny misplaced him. By virtue of his talents and cast of mind he should have been solely a destroyer, but through perverted circumstance he was called upon to organize and build. He had not the tolerance which should belong to the founder of a national church. He failed to see that the Reformation was no less political than religious. From the very first he was the leader of a minority, which, however vigorous and determined, was still a remnant. He sought to dominate the State and failed, thus leaving to the future a rooted feud of Church and State. "Whatever it might be in form—and it was not till the eighteenth century that dissent could be openly avowed—the Knoxian church was essentially the church of a minority; and thus we are confronted with the singular paradox, that the man whose ideal was a theocracy, a *Civitas Dei*, has become a parent of schism, the father of Scottish dissent."

The chronological gulf between Knox and the Moderates of the seventeenth century is bridged over by Andrew Melville, the champion of Presbyterianism, and James VI., who was wont to observe, "No bishop, no king." As a great deal of misconception exists regarding the origin of Scottish episcopacy, we shall call particular attention to Mr. Mathieson's ninth chapter, entitled "Bishops and Presbyters, 1572-1625." The Reformed Church of Knox's day was neither Episcopal nor Presbyterian. It certainly inclined towards Presbyterianism, but the question was not decisively settled when Knox died. At the time of Melville's return to Scotland in 1574, the Episcopal system had been rendered scandalous by open simony (as, for example, in Morton's appointment of John Douglas to the Archbishopric of St. Andrew's), and an active crusade against it began. In July, 1580, it was condemned by the Assembly, and for thirty years "new presbyters" had all the power of old priests and prelates. James VI. had been seated upon the English throne for seven years before Episcopacy was reëstablished to the north of the Tweed.

It is the pacific spirit of these bishops who came to preside over the Scottish church in 1610 that Mr. Mathieson makes the chief object of his praise. They did not begin by declaring the *jus divinum* of episcopacy, but were quite willing to preside as Commissioners of Assembly over a Presbyterian Church. This at least was their personal disposition; and even when the Crown urged them to become partisans, they preserved the Melvillian framework of kirk-sessions, presbyteries, and synods. The thorny subject of apostolical succession was kept prudently in the background, and the people were so little constrained to kneel at communion that the practice remained almost unknown. In a word, the bishops desired compromise, or, to choose a less unpopular word, they desired a reconciliation which should exalt Christianity on the ruins of faction. One of them, William Forbes, Bishop of Edinburgh (†1634), went farther still and wished to heal the breach with Rome. "The ideal of his life," says Mr. Mathieson, "was to reconcile the Roman and Reformed communions; and to this end he made concessions which even the most moderate of his own party regarded as far too great. It was sufficiently startling to an Edinburgh audience in these days to be told from the pulpit that Christ died for all, that the Pope is not Antichrist, that a papist, living and dying as such, may be saved, that Christ is really present in the sacrament, though in what manner cannot be known." All the ritualistic bishops were Arminians, and John Crighton did not hesitate to style predestination "a doctrine rashly devised, hatched in hell, and worthy to be delete out of God's word."

It may be urged that when Forbes was making advances to the Romanists and Crighton was attacking predestination, the work of winning over the Presbyterians could have met with little success. Mr. Mathieson, however, does not "regard such men as Crighton and William Forbes, liberal and enlightened and charitable as they were, as true representatives of the Church which had emerged, weaker but infinitely wiser, from its long conflict with the State." Among the moderate Episcopalians, he finds his representative leaders in Patrick Forbes, Spottiswoode, and Cowper for the period before 1638 (when Presbytery was restored by the Puritan Revolution), and in Robert Leighton, Laurence Charteris, and James Nairn for the period after 1662 (when the bishops were brought back once more by the Restoration). The group which surrounded Leighton from 1667 to 1674 was certainly marked by a candor and far-sightedness that are most rare amid the raging feuds of prelatists and covenanters. In the words of Mr. Mathieson: "Leighton must be acknowledged to have founded anew, after it had been dissipated by the storms of the Covenant, that great body of pious, liberal, and enlightened opinion which, in the face both of episcopal and of ultra-Presbyterian secessions, has adhered to his golden rule: 'The mode of church government is immaterial; but peace and concord, kindness and good will, are indispensable.'"

Into Mr. Mathieson's account of the Covenant, the theocratic experiment (1648-51), the Pentland Rising, the Bothwell Rising, the Cameronians, and the Revolution settlement, we are unable to enter. We must be content to pause now that we have indicated his leading tenets. *Ex hypothesi*, few books can be more controversial than his, and it would be no difficult matter to cast ridicule upon the position of those whom he delights to honor. At the same time he has presented a brilliant defence of the Scottish Moderates and furnished a hard nut for the friends of Puritanism to crack.

DÖRPFELD'S TROY.

Troja und Ilion: Ergebnisse der Ausgrabungen in den vorhistorischen und historischen Schichten von Ilion, 1870-1894. Von Wilhelm Dörpfeld, unter Mitwirkung von A. Brückner, H. von Fritze, A. Götze, H. Schmidt, W. Wilberg, H. Winnefeld. Athens: Beck & Barth. 1902. Quarto. Pp. xviii., 652. With 471 illustrations in the text, 68 plates, and 8 plans and maps.

Of no other site and its history for three thousand years have we so detailed and comprehensive an account in a single book as Dr. Dörpfeld here supplies us for ancient Troy. He himself gives a history of the excavations there (pp. 1-25), a description of the buildings and fortifications of the different strata (pp. 26-242), an account of Homeric Troy (pp. 601-632), and a list of photographs and views of the ruins and discoveries (pp. 633-644)—or nearly half of the

entire work. Schmidt writes on Trojan ceramic (pp. 243-319), with a note on the Treri or Cimmerii as the inhabitants of the Troad just before the Greek settlements of the seventh century B. C. (pp. 594-600); Götze on minor articles of metal, bone, stone, and clay (pp. 320-428); Winnefeld on sculpture and plastic (pp. 429-446), and on graves and funeral mounds (pp. 535-548); Brückner on inscriptions (pp. 447-476), and the history of Troy and Ilium (pp. 549-593); Von Fritze on the coins of Ilium (pp. 477-534). Wilberg's name stands on the title-page, though he is the author of no section of the work, since he was the assistant of Dörpfeld in studying the architecture. The book is dedicated to the German Emperor, who granted the money for the completion of the excavations, in 1894.

Originally, Dörpfeld planned to give only an account of his excavations in 1894, and their results, but wisely extended his design since his discoveries of that year could be seen in their true relations only by the light of the previous and far more extensive explorations. Schliemann's books, 'Troy and its Remains,' 'Ilios,' and 'Troja,' now have value only as chronicles of his excavations, and as giving illustrations of some objects which have not been republished; whatever scientific value they once possessed has now passed from them. Dörpfeld himself treats Schliemann very tenderly, both out of loyalty to his former chief, and from a clear appreciation of the aims and circumstances of the early excavations. His collaborators, however, are distinct in calling attention to a bronze vase in the Schliemann Museum made up of fragments from three different periods, to bronze bowls which were published as helmets, to a large dish or platter which was listed as a shield, to riveted handles which were said to be soldered, etc. The "Treasure of Priam" proves to have been found not exactly as Schliemann stated; it probably was not in a chest, but in a niche, and the copper "key" found near it now seems to be a chisel. Some of the collaborators accept Schliemann's evidence only when corroborated, or in a second class, basing their discussions on the more careful observations of 1893-94. We hear no more of "owl-headed" vases, to say nothing of the "owl-headed Athena," who was withdrawn long ago, and the name *svastika* is not so much as mentioned. Schliemann went to the Troad not as an archæologist, but as a retired man of business, with a warm admiration for Homer and a strong belief that the poet had an historical basis for his story. His sole aim was to prove that the Homeric Troy had once stood on the low hill of Hissarlik, and he assumed that this settlement was the earliest of all. So he cut a broad trench from north to south across the hill, removing about one-fourth of the remains, destroying not only Roman and Hellenic ruins, and some from the Mycenæan period, but even important foundations of the so-called Second City. He had at times 150 workmen busy in these excavations, without a single archæologist as an adviser. Only in the fifth year of his explorations (1879) did he have the counsel of two men of science—Virchow, the anthropologist, and Burnouf, the French archæologist. In 1882 he secured the services of Dr. Dörpfeld, who had been engaged for four years in the German explorations at Olympia, and who has been since 1887 the head of the Athenian branch of the German Archæological Institute, and is the highest authority on Greek architecture.

No excavated ancient site has been more complicated than Troy. The accumulated earth and ruins there, at the beginning of the excavations, were in places more than fifty feet deep. Nine distinct layers of ruins there are described, bearing the records of at least nine different settlements. One of these is further divided by Dörpfeld into three periods, and another into two. If the main facts had been understood from the first, the problem would have seemed insoluble—the scientific investigation of the lower layers without the destruction of what was important in the upper strata. Schliemann's broad trench greatly increased the difficulty of the archæologist, by removing much needed evidence. The perplexity of the problem had been made indefinitely greater by the Romans, who, with the desire to make the hill a broad sanctuary for the Ilian Athena, had levelled its top, and in the process removed from the middle of the site not merely the remains of the recent Hellenic settlement, but also those of the Mycenæan age. Thus buildings of the ninth or Roman city came to stand at this point immediately over those of the fifth or pre-Homeric city. This fact was not discovered until after Schliemann's death, although he was surprised at finding pre-historic remains so near the surface—nearer, as we know now, than they were two thousand years before.

Another complication in the problem before the modern archæologist was caused still earlier, probably about the middle of the sixth century B. C., by the removal of the north wall of the Homeric city as building material for the fortifications of the neighboring Sigeum. Other difficulties arose from the difference of thickness of the strata in different parts of the site, and from the use of the same walls, with repairs and other modifications, by succeeding generations. Dörpfeld has added to the inevitable limitations set him by the demolition of ruins before he took charge of the work, by leaving part of the site in its state of forty years ago, in order that some future generation, with more scientific methods and perfected means, may have the satisfaction of testing the work of the last few years. He has declined also to destroy some monuments of the upper layers in order to learn what lies beneath. Thus, naturally, the lowest stratum has been least explored, but fortunately this seems to be of the least interest to us.

For the early history of the citadel of Troy, and its division into periods, the architecture, and in particular that of the fortifications, furnishes the principal evidence. For the nine successive settlements which he distinguishes on this site, Dörpfeld makes an estimate in round numbers of the age of each: for the first city from 3,000 to 2,500 B. C.; the second (Schliemann's "Homeric") city from 2,500 to 2,000 B. C.; the third, fourth, and fifth cities from 2000 to 1,500 B. C.; the sixth or Homeric city, of the Mycenæan age, from 1500 to 1000 B. C.; the seventh, in two periods, from 1000 to 700 B. C.; the eighth or Hellenic city, from 700 B. C., to the Christian era; the ninth or Roman city, from the beginning of our era to 500 A. D. The round numbers indicate the lack of precision. Clearly the author thinks nothing in the way of accepting the traditional date, 1184 B. C., for the sack of Troy, and he says that the true dates of the earlier strata may differ by a millennium from his estimates.

In the Homeric city, Dörpfeld supposes the main gate and approach to the town to have been on the southeast, and that this was the "Dardanian Gate," so called as leading to the Dardanian district. The northern wall, as we have seen, was destroyed long ago, probably in the sixth century B. C., but our author is ready to accept the belief in a gate near the northwest corner of the city, which would be the Homeric "Scæan Gate," opening toward the Hellespont where lay the ships of the Greeks. To this the approach from the plain would be much steeper than to the Dardanian Gate, but on the tower by the Scæan Gate the old men and the women would stand in order to watch the conflicts on the plain below. Since Hector was slain near the Dardanian Gate, Dörpfeld believes that old Priam and Hecuba, standing by the Scæan Gate, did not see their son's death, but that their first knowledge of the catastrophe came from the sight of his body dragged to the Greek camp behind the chariot of Achilles. This is a new but entirely reasonable interpretation of the Homeric story.

Our detailed knowledge of the history of the Trojan site for the thousand years from 500 B. C. to 500 A. D. rests largely upon the evidence of coins and inscriptions, though historians and others have preserved some information. Herodotus tells of the visit and sacrifice of Xerxes on his way against Greece, Xenophon refers to a sacrifice offered by a Spartan admiral, and Arrian gives an account of the visit paid to the shrine by Alexander the Great. From the anecdote that Alexander declined an invitation to look at the lyre of Paris, but said that he should like to see that of Achilles, the inference is drawn that a museum was maintained of relics of the Trojan war. The inhabitants of New Ilium certainly claimed descent from those of the Homeric city rather than from Greeks. Hector was the hero most honored by them, and no Greek heroes appear on their coins except as vanquished in battle. From 700 B. C. to the beginning of our era, Ilium was the religious hearth of the district, and the centre of a league, but was only a small town. Alexander gave to it the privilege of coining money, which it long maintained and exercised. The work before us gives 114 cuts of coins, some of which are of real excellence. The best of the series are of the second century B. C. From their first occupation of the district, the Romans granted autonomy to the Ilians on the ground that they were their kinsmen, and these privileges were renewed and increased by Julius Cæsar, who derived his descent from the goddess Aphrodite through Æneas. The Emperor Augustus, however, is called on a coin the "founder of the city," though an accident to his daughter Julia at the crossing of the Scamander nearly brought upon Ilium a heavy fine, which was averted by Herod the Great. Marcus Aurelius rebuilt the temple and gave to it a new statue. The whole citadel was then reserved for religious purposes, and the town extended for a considerable distance at its foot. The importance of the city at

that time is shown by the imposing remains of an aqueduct which would be no discredit to Rome itself. At no other period did the settlement cover so much ground.

The circuit of the Homeric walls is only a trifle more than a third of a mile in length, and encloses a space too small to serve as the camp or home of a large body of men, and Dörpfeld believes that, in the early form of the poet's story, the number of combatants was not nearly so large as the Homeric "Catalogue of Ships" implies, and calls attention to the fact that (according to the Iliad itself) in the next generation before the Trojan war Hercules, with an expedition of only six boats, had captured the city.

Our author expresses no view with regard to the ethnic relations of any of the early inhabitants of Ilium, nor as to the causes which led to the selection of a hill only a hundred feet in height, and no higher than parts of the surrounding plateau, as the seat of a kingdom, nor as to its sources of power and wealth. He limits himself to the discussion of that for which he has a scientific basis. Nor does he anywhere explain the double name in the title of the book, unless the explanation is indicated by a sentence which speaks of "prehistoric Troy and historic Ilion." More exact, apparently, would be *Ilios* for the Homeric city, and *Ilion* for that of later times; *Troy* is no older than *Ilium*.

With the material at his disposal, Dörpfeld has done the utmost. Though he does not shrink on occasion from expressing doubts, he accounts convincingly for nearly all the fragments of walls built at various times between 3,000 B. C. and 500 A. D. From a small portion of a building he often reconstructs the whole—just as a palæontologist will reconstruct from a single bone an animal of a long-bygone age—in a manner and with an assurance possible to no other architect. And he is a master not only of the art of architecture, but also of that of persuasion; he arranges his arguments in the most imposing and alluring form, and avoids the appearance of trying to lead the reader farther than the latter chooses to go. He has obeyed in spirit, and almost in letter, the Horatian rule for delay in publication, *nonum prematur in annum*. The excavations were completed in 1894, and this book was not published until the very last weeks of 1902. Few such works have been more carefully revised; the proofs have been read and the statements verified in the presence of the monuments, on the site of Ilium. The reviewer regrets to add that the book has no index, though this is needed.

FIRE PREVENTION.

Facts on Fire Prevention: The Results of Fire Tests Conducted by the British Fire Prevention Committee. Edited by Edwin O. Sachs, Architect. With photographs and drawings showing materials and results of tests. In two volumes, pp. xxviii., 219; vi., 226. London: B. T. Batsford; New York: Scribner. 1902.

The British Fire Prevention Committee was founded in 1897, as we are told in the Introduction, and was incorporated in 1899. In a protesting tone, the editor, best known to American students as the author of those folios devoted to the modern theatre which appeared between 1896 and 1898, notes that no Government aid nor any public recognition of any sort had been given (June, 1902) to the committee's labors. The writer goes on to say that, in spite of this lack of encouragement, "London has become the recognized testing centre of the world as far as unprejudiced, systematic, and trustworthy reports of fire-resisting materials are concerned." Credit is given to the United States for three sets of experiments —at Denver in 1890, at Brooklyn in 1896, and at New York in 1897; and great surprise is expressed that Germany, as the country of thoroughgoing investigation, should have neglected the subject, at least so far as public notoriety goes. No mention, however, is made of that other fact, which is perhaps sufficient to account for energy in one case and for indifference in the other, viz., that Great Britain, along with the United States, suffers immeasurably more from conflagrations than does Germany. It is hardly necessary here to give the reasons, so far as discoverable, why this extraordinary difference exists; but it is a well-known fact that English building is far more commonly a matter of woodwork, or largely of woodwork, than that of any Continental nation, while in the United States, of course, building in wood is the rule, even the brick-fronted houses of the towns being all of wood within, and even the so-called fireproof buildings having still an amount of carpenter work and joiner work in their construction which would be inconceivable to a planner of equivalent buildings in Italy, France, or Germany. It is, therefore, not surprising that three investigations were held in the United States, nor that a permanently established committee is working in London. What is surprising is the apparent willingness in England and America to accept as final a tentative condition of things in which all efforts are directed towards a mitigation of the evil inherent in the old ways of buildings with great proportionate amounts of wood, both in construction and in finishing joinery, while almost nothing is said or done about replacing combustible material with that which will not catch fire.

The first volume of the work before us deals with tests of floors, ceilings, and partitions, together with one experiment on a so-called "nonflammable" wood. The second volume has to do with doors, with glazing, and with "curtains" in the sense of fire-arresting screens. It appears that a floor of steel joists, with concrete, collapsed rather quickly, though at a temperature nowhere approaching the maximum temperature allowed—2,300° Fahr. A similar test, applied to a floor of wooden joists with concrete and a ceiling of plaster applied to expanded metal, bore the maximum heat (always, by calculation and as nearly as could be ascertained, 2,300°) without serious injury. This fact had been plainly enough foreseen by architects who felt the need of precautions against burning. Thirty years before the close of the nineteenth century, the protective coverings of terra cotta, cement, wire lath with plaster, and the like were competing with one another as protections for iron work in buildings; and even then some of those architects who saw with anxiety and distress the continued and frightful loss of property and of life by fire, were convinced, and were ready to stand by their convictions, that heavy timber was a better resistant to heat than iron, even if protected by any means so far discovered. It was reasoned that a post which had a floor to carry would, if a hollow cylinder of cast iron, feel throughout its whole substance the weakening effect of the high temperature and would yield altogether, whereas the equivalent of this column in solid wood would char from without inward, and would hold a very considerable weight for hours after the charring had begun, and indeed so long as a part of the wood within remained unaffected. Wood is an excellent non-conductor of heat, and a stick of circular section eighteen inches thick would bear exposure to a very great heat, for a time so considerable that the intervention of the fire department might be almost counted on to save that pillar before it lost all its strength, whereas the cast-iron column would collapse with a very brief submission to the same degree of temperature. To this was to be added the well-known fact that the rush of cold water upon the iron would produce a further ruinous effect, whereas on the slowly charring wood it would work no injury, but would extinguish the fire and leave a certain portion of the post intact.

There was no great gift of perception needed for this, nor any ingenuity in the putting up of the heavily framed timber construction. At the very same epoch which is indicated above, the well-known "mill construction" of New England was taking shape, the investigation being pursued along nearly the same lines. In short, it appeared that those who were reasoning about the matter, being moved thereto by strong conviction and something like emotion of disgust at the "annual ash heap," were inclined to be very reluctant to use rolled or cast iron except in buildings from which all combustible material was excluded. Those, on the other hand, who were putting in iron beams, iron columns, and the rest, were often the men whom the dealers in patent materials could more easily persuade. There was a wonderful amount of pressure brought to bear upon every person connected with building—a pressure not dishonest, not unintelligent even, but which looked primarily to the increase of the dividend of the rolling-mills, of the foundries, of the many companies made up on purpose to work new processes of protection against fire. As it was about 1870, so it still is to a great extent; the world of builders is very slow to learn the lesson that iron in any form is just about the most dangerous material that can be introduced into a building unless all possibility is removed of getting up a brisk fire within the walls of that building. But that is just what the other community, the community of renters of buildings and of offices, will not put up with. The firm of lawyers, the firm of brokers, the firm of architects who hire an office, is generally made up of men who cannot conceive of comfort with other than wooden floors, with other than wooden doors, dadoes, door trims, window trims, frames and sashes, and all the rest of it. The main structure of the building, if a modern structure, will be in nearly every case incombustible throughout; but it is overlain with

an amount of wooden flooring carried on sleepers between which (the cement filling being omitted) there is often a series of horizontal flues each about an inch and a half by eleven inches in section, and along these the fire runs merrily and is given help to run. At each end of these flues there is wood in the form of well-oiled and well-varnished baseboards, and probably dadoes three feet high, which in their turn lead to door trims, and so on for ever. So it has been for thirty years, and so it continues to be; and now comes this London committee and tests by careful experiment a number of differing floors and partitions, and publishes the result in a series of tables.

Tables they are, and nothing else; the books consist of tables, for although there are pages of minute, detailed description of the occurrences in the course of each test, these descriptions are, of course, tabulated, in the sense that the little paragraphs dealing respectively with separate phenomena must follow each other in the order which the succession of events has dictated, and cannot be organized into a narrative. For instance, in volume ii., pages 36 to 50, are set forth the results of a double test with a two-inch framed oak door with two-inch solid panels, and a teak door of the same dimensions in every respect, and the test applied was settled to be "a fierce fire of one hour, gradually increasing to a temperature of 2,000° Fahr." It is clear that the pages describing this double test could only be of a tabular character, and indeed it will be found that many of the pages have a tabular form, the double-column arrangement being adopted for these pages only. There are a great number of photographic illustrations accompanying the account of this double test, as well as the succeeding test in which an oak door and an American walnut door were compared. It may be mentioned, by the way, that the four doors did their work about equally well—fifty-five to fifty-eight minutes limiting their resistance, counting to the moment when the door finally collapsed.

It will be seen from what has been said that there is here no treatise on the subject, and that the student who takes this book in hand must compare somewhat minutely table with table, plate with plate, doing his own little sums of subtraction to fix the amount of time consumed in each test, and not merely "draw his own conclusions," but set down on his own memorandum-papers the figures upon which his conclusions are to be based. No one, indeed, may complain of this: it is a perfectly sensible way for a student to proceed, and it is probable that most persons wishing to examine this subject thoroughly would rather receive the record of the test in this abstract form with hardly any comment, except in Mr. Sachs's introduction, than to have the whole thing reduced to the semblance of a magazine article, more readable, but not so precisely instructive.

The Oriental Series: Japan and China: Their History, Arts, and Literature. By Captain F. Brinkley. Boston: J. B. Millet Co.

Of the full dozen finely illustrated volumes in this series, eight are devoted to Japan and four to China. In the second half, issued this year, the same excellence in mechanical production of text, picture, and binding is maintained. Volume VII. deals with Japanese applied art, more especially in architecture, sculpture, decoration, and sword furnishing, and Volume VIII. with the keramic art of Japan. A work dealing authoritatively with the long story of Japanese pottery, from aboriginal baked clay and dolmen relics to the triumphs in material, decoration, and form from Satsuma and Hizen, was needed. Although there is a very respectable library of European works on the pottery and decorative porcelain of Japan, yet the astonishing inaccuracy of most of them has long been known to all serious students of the art and its history in Japan. If Captain Brinkley is sometimes rather severe upon certain authors who have posed as experts and authorities, it is because more than thirty years of critical study of the original authorities, from pen and kiln, gives him the right to speak.

He begins his accounts with the clay effigies which in primitive ages were made the substitutes for human sacrifices. He is inclined to believe that, apart from aboriginal essays, the keramic industry had a sufficiently recognized status in Japan before the advent of letters, and that it flourished chiefly in Idzumo. Japanese tradition points to the later introduction of improved shapes and of glazing from Korea. The long step in improvement was made in the eighth century, when the Buddhist priest Gyogi, who is credited with the introduction of the potter's wheel, came to Japan. He instructed the people wherever he went, not only in keramics, but also in the arts of carpentry, carving, engineering, writing, and poetry. The next great step was in the thirteenth century, when Kato the potter, having voyaged to China, and during his six years' stay learned many keramic secrets, returned to Séto, his native village in Owari, and gave new impetus to his art. After his long and industrious life, Japanese pottery became in common language "Séto ware." Besides a temple reared in his memory (a long inscription detailing his life and achievements and the preservation of his relics), the "Prince of Potters" and the "God of Kilns" has semi-annual festivals held in his honor, of which horse-racing and dancing are the chief features. The Japanese is nothing if not merry at his worship. To the wares of Hizen, Satsuma, Kioto, Kaga, Owari, and Mino, the author devotes a chapter of description, criticism, and lore very delightful to those who have feasted their eyes on the native shapes and decorations, and electrified their finger tips with the glazes. As the Greek colonist took fire from the shrine in his native city, so the Japanese travellers and diplomatists from Nippon carry to distant countries, to soften the pangs of absence, pottery made from the clay of their native land or district.

Capt. Brinkley does not pass over modern developments, but, for obvious reasons, these do not detain him long. Then the pictorial art is taken up. Interesting as this is in itself and worthy as is Brinkley's text, even after Anderson's masterly and well-nigh exhaustive catalogues and publications, and Fenollosa's subtle criticism, yet of striking, almost startling, interest are the pictures and description of the work of the painter Watanabé, who, except as Mrs. Fraser refers to him, has been passed over by modern essayists. He was the pioneer of Western influence in painting, and for this heresy he fell under political suspicion and received the fatal order to commit suicide by hara-kiri, which he gracefully accomplished. On the fiftieth anniversary of his death—that is, in November, 1890—"New Japan" did homage to his memory by exhibiting for two days at the Reigan temple in Tokio a large collection of his works. Meanwhile, the priests chanted litanies and recited mass for the repose of the ill-fated painter's soul, and the dirk with which *seppuku* had been committed rested on the original tray of white pine from which it had been taken for the final act. It is easy thus to account for that "want of receptivity" among native artists of the nineteenth century to which Dr. Anderson refers. Hokusai felt the foreign influence, but not to the point of receiving an order to open his bowels. Although there are contemporaneous artists of fame who preserve the characteristics of Japanese painting while adopting all the technical teachings of the West, Capt. Brinkley concludes that to marry Japanese pictorial art to the art of the West "would be to deprive it of its individuality and therefore of much of its charm."

In treating of bronze casting, architectural sculpture, the decoration and the multifarious applications of art, both as pure design and as representation, to the sword, the author is exceedingly felicitous. Not only is he a trained soldier and a scholar, like the Japanese samurai himself; few, perhaps, know the national and local history with more critical acumen and width of scholarship. Under his treatment, Japanese art appears as the perfectly natural outgrowth of the country and people. How the hermit islanders loved to picture the "Outside-country" men—the Dutch, the Mantchu, the Aino, the Tartar, the Formosan, the Cochin-Chinese—is told with wit and truth. The particular work of each artist receives historical treatment and just appreciation, while our author's running commentary on the works of European writers is well seasoned with the salt of criticism.

The remaining four volumes are devoted to China, and here the author naturally shows, in comparison, some limitations, which he frankly confesses. Yet, on the subject of keramic art, the writer is a master, for, besides seeing most of the originals which are described in his pages, he has been surrounded by experts in æsthetic lore. It is more than probable that, in these discussions of early and mediæval Chinese pottery and porcelain, celadons, monochromes and polychromes, and the various decorations over and under the glaze, we have a mass of critical knowledge that sums up the whole situation better than any single writing thus far attempted.

Proceeding from art to describe the features of the country, its administration, finance, and early periods of foreign intercourse, the author has the advantage of knowing much from the native writers and their works, and the best that has been produced by Occidental scholars who have lived in the country and obtained knowledge at first hand. Strange as it may seem, Capt. Brinkley, though an Englishman of strong personal tastes and ideas, does not wholly approve of the way his countrymen and others have tried to force China to adopt

an alien civilization. His discussion, in three chapters, of "The Propaganda and Chinese Religion" is, in every sense of the word, temperate and luminous. Naturally, the most interesting portion of the concluding volume is the final chapter, entitled "To-day." The reading of it is not calculated to make one proud of the methods of Western diplomacy, although one gets the idea that in writing it the author has exercised unusual self-control. While for the loss of two hundred and thirty-seven foreign lives, the Chinese Government under compulsion ordered three suicides and three decapitations, yet on the other hand "a vast number of Chinese fell under the swords of the avenging troops; and it is undeniable that against many of these sufferers no offence could be charged except inability to exclude Boxers from their hamlets. . . . Whole districts were ruthlessly and needlessly laid waste." In the notes of the appendix, the subject receives fuller treatment: "The seeds of hatred sown in that evil time must add their quota to the crop of tares that overgrows so much of the story of foreign intercourse with China. . . . The Far East, then, is the storm centre of the world to-day."

Besides the notes, chronological tables, and abundant and well-made indexes, there is an excellent map of the Chinese Empire, Korea and Japan, which shows the railways both complete and projected.

The Dukhobors. By Joseph Elkinton. Philadelphia: Ferris & Leach.

Those who are interested in that now famous sect, the Dukhobortzi (commonly abbreviated into Dukhobors), cannot do better than read Mr. Elkinton's account of their settlements in Canadian territory. Mr. Elkinton is a Quaker, and his fellow-religionists have taken particular charge, so to speak, of these Russians, who hold views akin to their own as to bearing arms, and in their general lack of ceremonies, notably in the contraction of marriages. The author is, obviously, more accustomed to perform good deeds than to prepare a book of reference, although that is, practically, what his work is intended to be. The reader should make marginal notes in order to refind his desired statements of fact, as events follow neither a chronological nor any other definite order, and many are repeated, as though the present volume consisted of a collection of articles written at different times and not thoroughly revised. The numerous pictures add to the interest and value; but beyond these the reader must accept as entirely authoritative nothing except the description of the Dukhobors' life, manners, and principles in their present home. Had the author had access to the Russian view of the situation in Russia, the internecine quarrels over money between Verigin and his rivals, the mutual denunciation to the authorities of the two parties (which cupidity and treachery were the cause of the whole trouble that ended in the famous exodus); and had he explained these matters from the Dukhobor point of view and (if possible) justified them, the historical as well as the sociological and human worth of his book would have been immeasurably enhanced. However individual the above-mentioned actions may have been, their momentous effect on the whole community is self-evident; and the lack of explanation vitiates the statement of the events which underlie the present situation, and renders this account as one-sided and partisan as the isolated statement of the Russian point of view would be.

Neither need the summary of Russian history, which is appended, either to increase the size of the book or as a necessary corollary in the author's mind, be taken seriously. It shows lack of study and comprehension, quite naturally. As the author himself says of the Dukhobors: "Divine truth is frequently so associated with human error, even in the most devout minds, that we shall always need to separate and cherish the spiritual purpose and ideal, apart from its expression." One thing is certain: aside from their rebellion against the constituted authorities, which effected their emigration from Russia, and which the Canadian Government is now engaged in contending with, these people possess many and admirable virtues. To their kindliness, hospitality, and lack of rancor towards Russia, the Russian Bishop of North America has recently borne witness. While engaged in a pastoral visit to some Bukovinians near one of the Dukhobor settlements (these were not among the fanatics who "sought Christ" last autumn, by the way, but the more rational contingent), the Bishop called on the Dukhobors. He told them who he was (and his garb of itself showed his calling); but he was cordially received, treated to sour cabbage, black bread, and tea—out of deference to Lent they chose the suitable viands—and to the singing of Russian ballads by their maidens. Among the latter was one, "The voice of our petition has reached the Tsar," and neither in this, nor in what they said, did any hostile or unpleasant spirit toward Russia manifest itself.

Mr. Elkinton admits that the sect has erred in the past, and he thinks it likely that there may be further disintegration in the future. He is quite sure that they will never become paupers, and that the unprecedented aid which has been rendered them has been well bestowed; in which the reader will agree with him. His full statement of their contentions with the Canadian Government is, perhaps, the most valuable feature in the book, both in its authoritativeness and in its complete frankness and fairness. He also sets forth the origin and progress of the regrettable march in search of Christ last autumn, and attributes much of the trouble which has arisen, so far, in the communities, to the malignant efforts of a professional agitator; in which he is probably right, given the admirable character, in most respects, of these Dukhobors as a whole. He also admits that "they have been driven into a false position toward all government, and the writings of Count Tolstoy and his followers have emphasized this disposition." Had he but explained that most interesting point, how Tolstoy came to be connected with their religious opinions, his book would have filled a want which the public has felt ever since the Dukhobors began to be prominent. But this belongs to the side of his subject of which Mr. Elkinton is blissfully ignorant—the Russian side.

Despite its defects and lack of coherent arrangement, the volume contains many valuable facts, worthy to be culled out and perpetuated.

The Eldorado of the Ancients. By Dr. Carl Peters. With two maps and 97 illustrations. E. P. Dutton & Co. 1902. Pp. x., 447. 8vo.

This is practically a prospector's report of the results of his search for gold-fields in South Africa. The author spent two years in the lower Zambesi region, appropriating territory and registering claims for the "Dr. Carl Peters's Estates and Exploration Company." Of his success he apparently has no doubt, for he affirms of one of the properties acquired, "The Windâhgil Mine, especially as regards the richness of its ore, is second to none in the whole world." We confess to a slight feeling of surprise that he makes no offer to his readers of a limited number of shares at a price much below the value which they will have when put upon the open market. It is difficult to feel much interest in a book written with this object, and Dr. Peters has not the literary ability to make the narrative of his uneventful journeys in a comparatively well-known country entertaining. He himself figures largely in it, even to the extent of three full-page portraits. One of his first acts on reaching the field of his labors was to name a prominent height Mount Peters, and his pages contain numerous personal references and irrelevant extracts from his diary, together with tediously minute details as to the lay of the land and its geological formation.

Following the narrative are six short chapters containing, with many quotations from ancient and modern writers, Dr. Peters's reasons for believing this region to be Ophir and the goal of the voyages to Punt. We have been unable to discover that he has added anything of material importance to what has been said on these subjects, but we readily grant, to use his own words, that his discoveries have "thrown new light on the ruins of Inyanga, and established that ancient copper-mines exist on the Sabi. By their means I believe that I have contributed something towards the unravelment of the Himyaritic era of South African history." He points out, in some concluding chapters upon the present condition and future prospects of Rhodesia, a great mistake in its founders in that their efforts were directed exclusively to the development of its mineral resources, the construction of roads and the building of towns, to the neglect of all provision for cultivating the soil. In consequence, in the summer of 1901, there was a state of general want, "even of poverty." Dr. Peters characterizes the genuine Rhodesian as one who is in the habit of waiting for a "boom" in the bar of a public house in Buluwayo, Salisbury, or Umtali. He condemns the system of granting extensive concessions "under which groups of capitalists who do not want to take part in the actual work of developing these regions, settle down on large land and mining rights, and by this means keep smaller men from proceeding with the real working of the country." But apparently he lays his company open to the same charge, for he registered 280 mining claims in three districts only of the many in which he prospected. His solution of the labor problem is to force the negro "to devote some twelve years of his life to working for the Government. During this time he should receive food and shelter, and a small wage, say about two shillings a month, like the Prussian soldier. He should

have Sunday for himself, he should be allowed to marry, he should be treated humanely and justly. The labor thus obtained should be contracted out by the Government to private enterprises." Although he here advocates just and humane treatment of the natives, in his own dealings with them he showed, in our opinion, a criminal indifference to their true welfare, especially by frequently giving them liquor. Any one who is familiar with the facts of Dr. Peters's career as an explorer and German official in East Africa must regret, for the natives' sake, his reappearance in South Africa, though in the humbler guise of a gold-hunter.

BOOKS OF THE WEEK.

Ade, George. People You Know. R. H. Russell.
Alden, R. M. English Verse. Henry Holt & Co. $1.25.
Augier, E., and Foussier, E. Un Beau Mariage. Henry Holt & Co. 35 cents.
Bachelor, Ann. Thoughts from Emerson. Boston: James H. Earle & Co. 75 cents.
Bashford, H. H. Tommy Wideawake. John Lane.
Bell, J. T. Civil War Stories. San Francisco: Whitaker & Ray Co. $1.
Bierwirth, H. C. Beginning German. Henry Holt & Co. 80 cents.

THREE NOTABLE BOOKS

NEW LETTERS AND MEMORIALS OF JANE WELSH CARLYLE

A collection of Hitherto Unpublished Letters, Edited, with an Introduction, by

SIR JAMES CRICHTON BROWNE

Profusely illustrated in photogravure and lithography from hitherto unreproduced originals.

In two volumes. Buckram, 8vo. Boxed, $6.00 net.

Mr. PERCY FAVOR BICKNELL, in *The Dial:* "A fresh installment of these piquant letters will be warmly welcomed by all Mrs. Carlyle's admirers. She is bright and entertaining here as in the earlier published correspondence. . . . A most charming and impressive work of literature. . . . The two volumes are of excellent workmanship, the clear type and finely executed portraits being a delight to the eye."

Mr. JAMES WHITCOMB RILEY writes: "A most valuable work, supplying as it does the real (though indirect) history and personality of a character as generally loved for her womanly graces as admired for her brilliant gifts of mind. Accept my congratulations upon your giving to the book-world such a treasure."

An Interesting Study by EDMUND J. CARPENTER

THE AMERICAN ADVANCE

A Study in Territorial Expansion, with a map showing the growth of the United States of America from the beginning to the present day.

8vo. $2.50 *net. Just out.*

By the same author: "America in Hawaii."

A New Nature-Book by CHARLES GOODRICH WHITING

WALKS IN NEW ENGLAND

With 24 Full-Page Illustrations from Photographs.
8vo. $1.50 *net. Just out.*

The well known columns in the *Springfield Republican* make Mr. Whiting familiar to readers as a poet and essayist drawing his inspiration from Nature.

JOHN LANE PUBLISHER NEW YORK

State Experiments in Australia and New Zealand

By

WILLIAM PEMBER REEVES

2 vols. 8vo, with maps, $7.50 *net.*

These studies are by a colonial official and represent his observations from 1881 to the present time. His collection of data in regard to the legislation that has been watched so eagerly all over the world is of great value.

An Artist's Creed

By E. P. B.

Sm. 12mo. Cloth, gilt. 75 cents net.

The Baptist:

"This choice little book deals with various aspects of beauty, not only in a poetical but in a philosophical manner, leading up to the wondrous beauty of God Himself. The absorption of the mind of the author in the idea of beauty is witnessed by the clear, pellucid style of his writing. It flows on like a charming poem, rich in its ideas and suggestions, and winning the heart, as well as the mind of the reader."

The Examiner:

"A sweet little volume, it abounds in beautiful epigram, and has a truly elevating style and tone."

AN EDUCATIONAL DIRECTORY.

School Trustees, Principals, Teachers,

And others interested, are invited to consider the advantages offered by the *Nation* as an advertising medium. There are probably few weekly periodicals whose columns offer so favorable an opportunity for reaching an audience interested in educational matters. In its special field of political and literary criticism the *Nation* is unlike any other periodical, American or foreign. Going, as it does, to all the principal libraries, reading-rooms, and clubs, and into thousands of the best homes, addressed to the intelligence of the country, the *Nation* finds its readers able and anxious to secure for their children the best educational advantages.

The School List in the *Nation* has been a representative one for many years. It includes cards of many of the most prominent educational institutions everywhere, during the season of school advertising, and a considerable number are inserted in the paper throughout the year.

The rate is reasonable, and discounts are made on continuous insertions, of which most of the school advertisers avail themselves.

The *Nation* is sent free while advertisement continues.

THE NATION, 206 to 210 Broadway, New York.
